Preface

One of the ways the binary axes¹ of governance can be aligned is by replacing them with national security governance as the new unitary bipolar axis. It will dampen the vibration in national governance simultaneously transforming the homo sapiens-sapiens, the subspecies that humans are, to sapien humans, an expressively evolved new species under lessened primitivism. It is the subliminal suggestion this book intends to induce.

This book is meant for the sapien humans, the sensibly evolving citizens of the fast-advancing world. This book is designed as a user's manual for positive thinking in national governance. There is a caveat, though. While reading this book, one should switch on the "how-to-think" mode from the usual "what-to-think" mode, which the *Homo sapiens-sapiens*, the subsystem of sapiens to which humans belong, are used to. The idea behind this book is to make the world of humans better, not that of the apes. It is time. It can be done. The leading trendlines show.

This book is the result of a lifelong study. It deals with the most complex subject to execute in the world of humans—governing by national security. It is more complex than performing a septal myectomy on a motionless heart or decompressive craniectomy for a brain to survive. Medical professionals may not agree. The author consents with them too, because governance can be made much simpler if professionally carried out. It is mentioned later.

Till then, governing under vested interests, which the majority governments follow, makes it easy for those in authority. The complexity appears when nations decide to govern in the national interest of human well-being. This study attempts to simplify it by providing the intellectual infrastructure. It is silent on the ideas on how to govern. It is also not interested in critically examining the ongoing governance and throwing blame on any of the issues. This book can help by supporting the thinking process to craft strategies and appropriate tactics² in national governance for those interested.

¹ As referred to in this study for the two power axes in national governance: political and faith based.

² The term tactics is used in this book in both singular and conflicting plural forms from the familiarity point of view.

The book refrains from direct forecasting or predictions. Millions of forecasts and predictions happen every day based on human thinking. Most of them are based on negativism that clouds the thought process. Many such bland predictions are visible in the antiquated information media. Great depressions, famine, food shortage under economic theories, world wars, colonising planets by the end of the twentieth century, nuclear winter, global communism, Martians on vacation to the planet and a host of other conjurations of fancy were forecasted earlier through soliloquies, dialogues, seminars, publications and every other media. This book finds such predictions unwarranted but considers that humans will only advance in surging movements (fore and back motions in this study) and not decline if the process of evolution has to be believed and if human intellect is the ultimate survival tool.

Governance is a practical subject. People can be trained to govern. Mythopoeian capsules honour Kautilya for conditioning and training the young Chandragupta Maurya, who was told to be a shepherd kid or a peacock farmer, to build and govern empires. Chandragupta was not a period prodigy by birth, but a person of humble origin like majority people of the world. This book attempts to throw some light for such people and their mentors to look ahead and move forward. That means everybody.

This study is meant for the global gallery. It is not about a particular nation or human system. India, however, is at the centre of the study. The author found India to be an excellent biomodel to study the concept of national security. He envisages governing national human systems by national security and expanding it globally when the world is ready. India, very well, will be the world's most populated country in a short time, if not already now. It has been the world as a prolonged continuum; it is expected to remain that way. Everything about the world, warts and all, will be visible in India. That makes it the best laboratory cum biomodel to study human behaviour in a global system. What happens to India can reflect in the world. India is an extensive continuum of accumulated human knowledge and a vantage point for telescoping into time that is irreversible as well as yet to come, in search of truth from facts. There are others too.

Each word in the title of this book is a key word. This book is a revisit to the studies the author has been carrying out in the past, publications on them and the concept itself as advanced by various eminent scholars and experts the world over. They are examined in a never before appreciation with the hope that it would encourage further research and advancement befittingly benefitting future generations in a crowded and conflicting world. Emphasis on revisit also leaves behind the probability of further visits in the future by scholarly researchers. A revisit will need the old records as terms of references for navigation into the future. This book is a guide for future visitors on the subject.

National security is another key word in the title. The book explains the concept in a staccato fashion reiteratively. It is done to reaffirm the concept since it has a different take from the known. The take is that national security is not security of a nation. It is not about physical or military security alone. It is also not about the now decrepit term non-military security, as recommended in this book. Military security is an inclusive element of national security in this study. There are 15 other elements

besides military security. All of them work together. None of them stand alone as mutually exclusive. Hence, non-military security cannot be a term in the identified concept. No element works independently or exclusively when the concept is national security governance. In the compounded term national security, the independent terms nation and security lap dissolve into each other as a singular concept.

The study prospects two objectives: governance and well-being. They are there but have to be prospected carefully like the ancestors of the Wild West who panned gold from downstream rivers of El Dorado Canyon in Nevada, USA, in the early days of mass migration. Prospecting governance and well-being is more complex. First is to appreciate the process of governance. Thereafter, it has to be guided towards the goal, the end objective, of human well-being. The latter is trickier because it is not a dead-end objective being reflective on governance by retreating equidistantially in every approach forward.

The governments are aware that the process of governance is complex. Human hybridity adds to the complexity. This study mentions it. But the solutions are left to human ingenuity in governance. The nation that does it better has a chance of providing more to the people. This study is expected to provide the framework.

There is knowledge on the wings of the chapters, tangentially in the quotations of the author at the beginning of a part and chapter that are subliminally elaborated in the chapters, citations and opinions at the footnotes and suggested readings in the bibliography for critical examination in how-to-think mode. Specialised information is given in a staccato style to make reading interesting and informative. There is reiteration to emphasise corroboration in the reader, and more so to ignite thinking factually and counterfactually under falsifiability. The design of this study is to bring out maximum research on the subject of national security and governance aimed at human well-being. It has to be in the right perspective. The chapters are designed not only to provide necessary continuity but also for independent study on the subject as the readers may be familiar with different subjects that belong to different genres. This book is also written to be used as a textbook for postgraduate studies in national security and governance in an entirely different perspective. All these can lead to maximum research for continuing the study of human well-being as the primary role of governance and all other factors of governance supplementary to it. The glossary provides definitions for most of the identified or differentiated terms in the study to avoid semantic dissonance in understanding and appreciating the concept. They are subject to changes and modifications in future. That may demand another revisit to the concept as human system advances through surging movements back and forth. The topics while reading may shift pace and deviate by ballooning but will return to the point for continuity. The purpose is to provide expanded and elevated vision to the reader and also time to moderate thinking.

This is a “read any page anyplace” book, meaning that it does not have to be read page by page in unswerving continuity to understand the topic. It means read anywhere. Read anywhere is important in a book that has serious and dense subject matter. Repetition is also for reinforcement besides enlargement appropriate to the chapter. This way, each chapter can provide insight into the wholesome topic of national security for interested readers. The chapters will provide sufficient

information on the topic besides the concept of national security independently. Each chapter is designed as separate papers for restricted appraisal by those interested.

This book is about governing humans. It may look complex, but the author believes that governance is simple as humans are designed for it being an interactive species. They are not exactly cooperative species as concluded by bioscientists unless cooperation is conflict inclusive. Humans need each other even to clash. That means they need to be governed by harmonising the interactive behaviour of conflict and cooperation. That makes governance look complex. The author has adopted a push-pull style in this book to convey the simplicity of governance in the complexity of national security maximisation. At times, the author pushes himself to the readers. Some other times, he pulls them towards moving away. This style is visible in this statement itself. Whatever is the push-pull approach, the reader need not be an expert in any of the subjects mentioned in this study to appreciate it. Repetitive and paused reading will be helpful.

National security is not a difficult topic to appreciate and ideate. But it needs special acuity and competence to practise and execute. This acuity is available with the governments in terms of professional competence and leadership in the present-day world. The unitary civilisation is advancing along with the worm tunnel containing it positively forward. Future competence in governance is assured. There are more about them in this book.

This study is normative as well as positive as in economics. Mostly normative, it is heavily influenced by human behaviour. There is a kind of capricious hybridity in studying humans. The title of the book carries hybridity as a key word. It is applicable to humans.

This book is about humans. The world revolves for them. They are the only ones among the living who know that the world is dynamic. It revolves creating seasons to nurture life if looked at the process passively. Other life forms may feel the dynamics. But they do not know. They do not go to school. Human, as a key word, begins with the title in this book. It is also the last word in the last chapter (Chap. 35). This book is for them, about them. Governance too is for them, by them being interactive. Humans mean those who belong to the subspecies *Homo sapiens-sapiens*. The repeat word *sapiens* emphasises that humans belong to the subsystem of *Homo sapiens*, the only species in the subsystem. This helps to look at people as sapien humans, a step ahead as virtual species, perfectly humane according to the author since it is not necessary to segregate humans from another subspecies along with it. By this posit, the author submits to the wise and learned readers that humans can grow beyond their evolutionary rhythm or natural frequency just by using their survival tool—the intellect. It is emphasised in this book. Humans can be better than what they are by freeing their intellect from survival emotions by right discrimination. They can be considered that way even if they are not aware or consider themselves qualified for such elevation. If done, it will be good for the world. They will do it, ultimately. They are not at the moment. They can practise it while reading this book. That will go well with them in their interactive demeanour and self-belief.

The book communicates more tangentially than directly for reasons that are intuitive. It has to be unbent to remove the kinks. It calls for continuing studies and pragmatic people-centred governance. This can be assured only by interventions on ground.

Fundamentally, this book is aimed at dynamic readers, students, teachers, scholars, authorities and human communicators who are willing to think and relay knowledge challenging it all along. It is advisable to stop frequently while reading to think “how” as if to rehydrate in the middle of a long truck. It will be fun to make many stopovers while reading this book to think, repeat and continue reading anywhere. But never read it in one or two sittings that too lounging on the bed or munching some whatnots. Be alone while reading it, if possible.

The quote in the preface is the longest in the book. It will be understood while reading on. It implies that the world is not governed along a unitary axis of political power under bipolar balancing. There is another axis formatted under the power of belief systems. Both the axes are flushed firmly with each other though they act differently causing a kind of wobbling sensation by mismatch of frequency. The resonance causes the wobbling. Whether one will stifle and finish the other one day is considered an irrelevant question because both balance each other similar to the bipolar system balancing each axis. The flux between the poles is the balancing force. The proof lies in the wobbling of governance that could be felt very fervently even for a casual observer. There is nothing wrong about it. That is how people are designed to balance their existence on a spinning and wobbling potato, which is thought as a cannonball fruit or a cape gooseberry, evenly spherical. For a close observer, the axes will be visible as the reflection of apparent security (human needs) and perceived security (wants, wishes and desires) within the human system. That is very important in governance. The governments should know the difference between them for strategic intervention to regulate the wobble in the system.

The iterations and reiterations are for reinforcement of knowledge by information repeat. They are not meant for overloading the reader or the student. It is also meant to make each chapter a separate readout for selective chapter readers, if so desired. It is also expected to generate curiosity in the inquisitive reader to examine and comprehend the concept further.

This book is the culmination of observations and explorations of a lifetime so far for the author, which he intends to continue and frequent further. The topics discussed are about sapien life that has been experienced, studied, discussed, debated, taught and written by the author in different modes of imperfections, leading to further perfection along the course of time. It is presented to readers and students for exploring further. There is added information along the way meant to minimise the semantic dissonance between the author and the reader. There is also a limited content bibliography that the readers can expand by additions as they move through.

The protagonist in the contents of this book is the sapien human. They are not there at the moment as an exclusive species. They may come evolutions later. But all sapiens can become a sapien human without waiting for evolutionary changes in the present context of the twenty-first century. The world today is different from what it

was in the past. It is advanced. People can become sapien humans by energising their intellect. It is behaviour modification without physical system modification. Every reader can turn into a sapien human in possession of sapience at least when reading this book and pausing intermittently to think over what is read before continuing it further, and, if so desired, permanently thereafter.

National security in governance is nation specific. But this book on national security is in the global perspective hoping to have a global human system one day within a firm, solid and defined boundary. But it stops at the nation keeping the wardrobe³ open.

There can be perceptual differences among readers about the nature of this book. The book combines different faculties of knowledge to format a hybrid system of knowledge. This simplifies the content. The complexity, if one finds while reading, is only because of perceptual dissonance. It is natural. It can be circumvented by reading in parts and ideating in between. It will also avoid sensual overload. But the reader will have to wander further into the world of information to revel into the complete essence of the contents of this book.

While some parts are suitable for a broad audience, some are esoteric. The book is in six parts in 35 chapters. The first part is a lengthy introduction about the subject matter in eight chapters. The book contains *a priori* (innate) as well as *a posteriori* (learned) knowledge. In fact, the innate information and knowledge are quite substantial. Humans are adaptive unlike animals. Animal behaviour is predetermined by default. The second part deals with each of the elements mentioned in the first part more descriptively in 16 chapters. The elements are seen independently, though all of them are mutually inclusive, and the ultimate results in governance come out of aligned and integrated governance of elements and the eight identified terrains. Though this book includes students on the subject among readers, it is not exactly designed with the didactical focus of a textbook especially for undergraduates. Part III deals with strategy, tactics and associated decision-making processes in governance in three chapters. Part IV examines the national security concept against the research needs and highlights the need for indexation of national security as the prime point of appreciating human well-being individually by a nation and also for comparative assessment. The part has three chapters. Part V, again in three chapters, looks at the future of humans and governance. It ends in a positive note for humans. The conclusions in Part VI are in two chapters. They highlight the positive notes based on the compositions and ponderings so far.

National security is everybody's business. There are innumerable constraints that prevent human well-being. The people and their governments together have to resolve the issues that constrain well-being. While it is threat perception and threat elimination at the low end, it is generation and accumulation of conditions under which the elements of national security are optimised and integrated terrain specifically for maximising national security as a whole at the high end. There are many books and other publications on the subject written by experts. They are all valuable

³ A la Narnia, the perfect but impossible world.

treasure chests of knowledge for discerning students of the subject. The objective of this book was to give an expanded, at the same time contrasting, view in right earnest as conceived by the author through prolonged research escapades.

Humans today live in a knowledge society. With the knowledge around, national security becomes a pragmatic subject for governance. The ideas of national security are also applicable not only to national governance but also for other human systems including the smallest formal unit of a family for goal setting. It is similar to applying military theories to business. Knowledge at the higher end is transferable as well as transformable with appropriate corrections. The ideas are much discussed in various forums in history. This book is in no way an effort to reinvent the wheel, though it is possible literally and figuratively in technology. This book is an exploratory and analytical examination of the concept of national security in a people-centric outlook. Human population of the world is nearing eight billion mark. By 2050, it is estimated to be 10 billion. That is big. But the world can take them all even if flooded, provided that the governments are competent and forward faced and the underlying principles of governance are strong and principled. The concept of national security explained in this study could provide relief to any type of existential aberrations. The book, in that way, is not specific to any nation, but to the people of every nation.

National security is a concept. A concept can be defined for identifying the system to which it belongs. The system has parameters and boundary. Therefore, if the parameters of the system are identified within its boundary, the concept can be visualised and defined. In this book, the concept of national security has been accepted as coexistent with humans. It has been in practice and continuously gaining importance in the sociopolitical system of every nation. It is not imaginary. The book is an attempt to identify the concept through verified parameters, understand its constituent elements and scan beyond. The period of this book is as long as the human experience can see and perceive correctly into the past and the future in their quest for well-being. In their long existence, humans have witnessed changes that have modified their thinking process. Today (2021), there is a clear and visible awakening in the awareness of national security as human well-being. The world appreciates the trauma of militant terrorism, and a consensus has almost emerged for a decent life sans coarse primitiveness. The book is specific to all these from a contrasting viewpoint. It does not challenge the accepted thought processes on the subject. Besides, it goes further and draws an exposé of global security. In spite of isolationism of groups and subgroups within them, there are still societies and individuals who believe in accepting the entire humankind with concern and in good faith as a single group. The author finds it in continuum India and many other communities worldwide. That is one of the reasons he is hopeful of the dawn of sapience in the world. These communities have demonstrated inner strength in scripting verses like *Vasudhaiva kutumbakam*—the whole world is one family—and *Sarve bhavanthu sukhino*—may all live happily. These verses of wisdom and similar others reflecting among various human systems around the world can unquestionably accept the concept of “global security” for global human well-being. It is much more than the infirm collective security. The idea of a global

family will be a hard sell even to the United Nations, where the belief at the moment is “collective security”, which in reality perspective is a term of convenience. The world is not yet ready to speak on global security because it is not yet a system with a feel. Mere thinking is not sufficient to act. It is the “feel” that prompts action in a human through cues and corresponding stimuli. The idea of global security will require adamant resolve rather than virtuosity to establish. It will take time, a lot of time, to make global security and well-being a reality. It will happen, though. “Then, why not now” is the question.

The secret of success of national security ideas also lies in bringing up the future generation along with the objectives. They are children today and yet-to-be-born stakeholders (non-stakeholders as stakeholders explained in this book). The present governments will have to make their world sustainable for their comfort and well-being. While observing the plight of children in various parts of the world, it is tragic to see that there are many who can pose unprecedented threat to the future. Unknown to them and the rest of the world, these children are getting conditioned for causing unimaginable harm to humankind in every way possible.

They are there in the battlefields of insurgents as child soldiers; on the streets as child prostitutes for the greedy and sick pedophiles; in schools of hate as future militants; on the trafficking routes as fleeting immigrants witnessing their mothers getting raped by the agents of human indignity and degeneration; in the fields and illegal units as child labour working with their nimble fingers; in the family consumer market as saleable commodities marketed by parents; in broken families as victims of fear and indifference; in households, farmlands and marketplaces as bonded labourers; in make-shift operation theatres as innocent organ donors; in the race courses of the primitive millionaires as strapped cargo on mad camels; everywhere as displaced orphans; on city streets as beggars employed by organised criminals; in conflict zones as unaware weapons of hate with bombs strapped around their waists; sleeping off in the arms of their starving mothers who fake cooking with stones in the boiling pots; sleeping in the corner of a dinghy room turned towards the wall where their mothers are selling their souls along with their bodies for earning a day's meal; in city corners and tribal areas as traffickers for agents of drugs to nuclear materials unknown to them; in cyberspace as degenerated hackers; in terror schools as potential agents of annihilation; in illegal pharmaceutical laboratories as unsuspecting guinea pigs; in abandonment facing discrimination and slow death; banished in society facing abuse and humiliation from conceited citizens; in defective households as victims of abuse and all over the world as traumatised children of irresponsible parents of dysfunctional families, some of them extremely affluent . . . The most poignant of all was the news from the deep global conundrum of human indignity, where even the United Nations' peace-keeping forces were accused of rape of innocent girls yet to reach their puberty. Their fate and that of the world through them will be decided by the trauma induced by the peacekeepers. There are also children around the world conceived by ladies

*who were victims of rape by forces who came home to protect them and find them peace.*⁴

That is not all. There are many children hanging out in an otherwise beautiful world draining off their innocence and waiting to grow up to enter the darkness of mayhem. These children are getting geared for the inevitable and may pose an array of threats to the world of tomorrow. And their numbers are swelling. It is going to be hard to predict the turn of events for the victims of child abuse. They may end up as mortal prostitutes, mercenaries, suicide militants, hostage takers, fixers, manipulators, transnational crime partners, traffickers, pimps, drug pushers and even deranged megalomaniac national leaders who may set the society on fire. Even then, a close look at these misguided and fatefully ambushed children still shows a smear of innocence in their gravitated smile and wary looks. They are still innocently beautiful, though being tragic victims of human greed and insanity. And so were all those who are part of the anteforce that burns the social systems today, as children not very long ago. It is not that the world is unconcerned. There are organisations at national and international levels, both governmental and non-governmental, that are concerned about children. But in the absence of an effective analytical mechanism, the difference these organisations can make can hardly be noticed in the emerging world of child abuse. The roar of the coming Armageddon can be heard against this background exclusively from today's victims of child abuse alone. It is like rafting calmly in a glossy stream with the sounds of the rapids that wait downstream increasingly audible. In national security governance, children are to be seen separately lest they should end up as agents of death and mayhem that the world will realise only late. This is a special part that is not mentioned further in the book.

To reiterate differently, this book is written for all—students to presidents and dissidents to conformists. It does not propound solutions to the problems of humanity. It does not speak about “how to govern” a nation. It provides a backdrop for the willing to question, appreciate and identify them. It is a primer on the concept of national security with questions that are yet to be answered. The subject dealt with has to be analysed in detail in its exclusiveness based on further studies and serious analysis. The book does not represent the official policies of any government or agency. The views expressed are exclusively those of the author as an independent researcher and student of national security.

At the end, the author has a request to the reader. Please read the preface once again, as a postface, once the book is finished.

Acknowledgements

Francis master was my teacher in the primary level (seventh grade). He was like anybody I met in life and also different from them. He introduced me to the term “Life”.

We were the juniors ready to move to high school as big boys. The year was 1958. That was when I heard about “autograph” for the first time. I got mine and took it around my teachers and classmates, and all those whom I knew in the school. They impressed their wisdom in those tiny pages for me to keep.

Francis master would wear a shirt tucked into a white *dhoti*⁵ with a well-knotted tie. He wore a light brown coat over the shirt—exemplifying the hybridity of the British and Indian familiarities of the period. He used to affectionately call me “Menon” very playfully. The enigmatic V.K. Krishna Menon, India’s fiery representative in the United Nations in those days, was his hero. He hailed from our town.

He opened my autograph and charily wrote “*Live and let live*”.

“Do you know the meaning?” he asked. I mumbled something. At home, I sought the meaning from my father. He smiled and said that I should empathise with others while caring for my life. “Love for fellow humans, my son, is the ultimate virtue in life”, he said. “That alone makes you a better human”, he added. Could he convince me? I do not know. But it hit me somewhere. I can still feel it. That is the reason I mentioned that love is “absence of hate” somewhere in this book.

The question “Can one live and also make the good live by letting the bad and ugly too live at the same time?” haunted me all along. Years later, I am close to the answer. It is possible, but somewhere I feel limited.

I want to meet Francis master again, preferably in the old classroom, and ask him whether it is possible to live if one lets others live too. I am sure he will answer “yes”. He was a sapient human, ahead of his time, like my father.

I acknowledge life through him and my father . . .

Read on. . .

Part II Elements of National Security

9	#1 Military Security (Milsec) (m_s)	343
9.1	Introduction	343
9.1.1	Conflicts: Sapien vs. Non-sapien	345
9.2	Military Security: Setting	348
9.3	About Military Security	351
9.4	About War	352
9.5	War in a “Peaceless” World	354
9.5.1	Prehistoric and Protohistoric Period Wars	356
9.5.2	Wars between Prehistoric and Protohistoric Period and Pre-nation State	361
9.5.3	Inter-period: 1648–1919	364
9.5.4	Inter-period: 1919–1945	371
9.5.5	Cold War: 1945–1991	372
9.5.6	Post Cold War	376
9.5.7	Reforms and Interventional Changes in UN	380
9.5.8	2021: So, Is War Over?	382
9.6	UN and War	382
9.7	Anatomy of War	382
9.8	War and Despise: Counter Theory	385
9.9	War in the Future	386
9.10	Cost of Military	390
9.11	Value Engineering Military	393
9.12	So, What Is Military Security?	395
9.12.1	Definition: Military Security	395
9.13	Summation	395
10	#2 Economic Security (Econosec) (e_{s1})	397
10.1	Introduction	397
10.2	Economic Security: Setting	399
10.3	Transboundary Nature of Economics	404
10.4	Globalisation and Economic Security	407
10.5	Money Trail in Economic Security	410
10.6	Economic Advancement	412

10.7	Government and Good Economics	418
10.8	Optimising Economic Security	423
10.9	Economic Security Indicators	430
10.10	Economics as Happiness Index	432
10.11	Mountebanking in Economic Security	434
10.12	Economic Warfare and Economic Security	434
10.13	Velocity of Flow of Money: Critical Factor	437
10.14	<i>Eenampeechies</i> of Money: Illuminati Paradox and Outgrown Lazy Money	438
10.15	Psychonomics: Thematic Inconsistency	441
10.16	Colour of Money	442
10.17	So, What Is Economic Security?	446
10.17.1	Definition: Economic Security	449
10.18	Summation	449
11	#3 Resource Security (Resourcesec) (r_s)	451
11.1	Introduction	452
11.2	Resource Security: Setting	455
11.2.1	Commons: National and Global	457
11.2.2	Classification of Resources	458
11.2.3	Politics, Culture and Resources	460
11.2.4	Resource Security and Threat Attraction	462
11.3	Critical Resources and Resource Security	465
11.3.1	Land	466
11.3.2	Air	469
11.3.3	Water	469
11.3.4	Food Resources	474
11.3.5	Metals and Minerals	475
11.3.6	Energy Resources	477
11.3.7	Strategic Resources	478
11.4	Resource Overshoot	480
11.5	Allocation of Resources	482
11.6	Mobilisation of Resources	484
11.7	Anticipated Resource Constraints	486
11.8	Worldwide Resource Web	487
11.9	Resource Ethics	489
11.10	Strategic Resource Access and Denial	489
11.11	So, What Is Resource Security?	490
11.11.1	Definition: Resource Security	491
11.12	Summation	491
12	#4 Border Security (Bordersec) (b_{s1})	493
12.1	Introduction	493
12.2	Border Security: Setting	500
12.3	Border Security Policy	501

12.4	Types of Borders	504
12.4.1	Land Borders	506
12.4.2	Maritime Borders	509
12.4.3	Air Space Borders	513
12.4.4	Outer Space Borders	513
12.5	Border Security Intervention	514
12.6	Border Disputes and Confidence Building	522
12.7	So, What Is Border Security?	525
12.7.1	Definition: Border Security	526
12.8	Summation	526
13	Demographic Security (Demosec) (d_{s1})	531
13.1	Introduction	531
13.2	Demographic Security: Setting	533
13.3	Human Population	535
13.4	Demography and Economic Growth	541
13.4.1	Human Investment Management: An Overture	545
13.5	Human Migration	548
13.6	Human Smuggling and Human Trafficking: Other Side of Migration	558
13.7	Population Trends	562
13.8	So, What Is Demographic Security?	564
13.8.1	Definition: Demographic Security	564
13.9	Summation	564
14	Disaster Security (Disastersec) (d_{s2})	567
14.1	Introduction	567
14.2	Disaster Security: Setting	571
14.3	Anatomy of a Disaster	573
14.4	Classifying Disasters	575
14.4.1	Nature-Induced Disasters	576
14.4.2	Human-Induced Disasters	600
14.4.3	Chance-Induced Disasters	606
14.5	Disaster Statistics	610
14.6	Disaster Cycle	612
14.7	Disaster Prevention, Pre-emption, Preparedness and Response	613
14.8	Cost-Benefit Analysis in Disaster Security	617
14.9	Disasters Through History	618
14.10	Climate Change Attribution	618
14.11	So, What Is Disaster Security?	621
14.11.1	Definition: Disaster Security	621
14.12	Summation	621

15	Energy Security (Energysec) (e_{s2})	625
15.1	Introduction	625
15.1.1	Enter the Blaze	627
15.2	Energy Security: Setting	628
15.3	Energy and Human Progress	629
15.4	About Energy	638
15.4.1	Renewable Energy	640
15.4.2	Non-renewable Energy	643
15.5	Expressing Energy Consumption	646
15.6	Energy: Status and Trends	646
15.7	Challenges of Energy Security	651
15.8	Energy Security and Law of Conservation of Energy	655
15.9	Is Energy Regeneration from Spent Energy Feasible?	655
15.10	Governing Energy	657
15.11	So, What Is Energy Security?	658
15.11.1	Definition: Energy Security	659
15.12	Summation	660
16	Geostrategic Security (Geosec) (g_{s1})	661
16.1	Introduction	661
16.2	Geostrategic Security: Setting	667
16.3	Examining Geostrategic Attempts in Statecraft	668
16.4	Diplomacy and Geostrategy	672
16.5	Is There a Hierarchy of Nations?	674
16.5.1	Hierarchy and Polarity of Nations	683
16.6	International Systems	686
16.7	Ideologies and International Relationships	690
16.8	Geostrategy and Natives: Hyphenated or Otherwise	690
16.9	United Nations: Controlled Collectivism in an Uncertain World	694
16.10	So, What Is Geostrategic Security?	700
16.10.1	Definition: Geostrategic Security	701
16.11	Summation	702
17	Informational Security (Infosec) (i_s)	705
17.1	Introduction	705
17.2	Informational Security: Setting	708
17.3	Securing Information	711
17.4	History: Information That Was and Would Have Been	715
17.5	Information and Intelligence	718
17.6	Rumours and Informational Security	720
17.7	Information Flow	722
17.8	Informational Security in Military Strategy and Information Warfare	724
17.9	Protecting Information	726

17.10	Information Trafficking	727
17.11	Psychological Operations and Information	728
17.12	Mediated Communication and Information	730
17.13	Paradoxes in Informational Security	735
17.14	So, What Is Informational Security?	738
17.14.1	Definition: Informational Security	738
17.15	Summation	739
18	Food Security (Foodsec) (f_s)	741
18.1	Introduction	741
18.2	Food Security: Setting	744
18.3	Food: Basic Need	745
18.3.1	Right to Food	747
18.3.2	Governing Right to Food	748
18.4	Food Insecurity: Curse of the Affluent World	749
18.5	Food Insecurity and Coping Behaviour	755
18.6	Food Production: Trends and Perspectives	757
18.7	Combating Food Insecurity	762
18.8	So, What Is Food Security?	769
18.8.1	Definition: Food Security	770
18.9	Summation	770
19	Health Security (Healthsec) (h_s)	773
19.1	Introduction	773
19.1.1	Life, Death and Health in Between	776
19.2	Health Security: Setting	783
19.3	Concerns of Health Security Governance	784
19.4	Public Health	786
19.5	Health of the World	789
19.6	Caring for Health	799
19.7	Crimes and Health	803
19.8	Extraterrestrial Threats	808
19.9	Health and the Art of Dying	808
19.10	Kill Bill and Other Ways of Dying	810
19.11	So, What Is Health Security?	812
19.11.1	Definition: Health Security	812
19.12	Summation	813
20	Ethnic Security (Ethnicsec) (e_{s3})	815
20.1	Introduction	815
20.2	Ethnic Security—Setting	818
20.2.1	Examining Macro Ethnicity	820
20.3	Divided Human	841
20.4	Divided System—Isolated Human	848
20.5	Ethnic Riots—Violence in Primordial Form	850
20.6	Psychology of Hate	858

20.7	Surviving Jealousy and Envy in an Ethnic Society	861
20.8	Clash of Cultures	861
20.9	Ethnic Security—Positive Signals	863
20.10	Ethnic Security—Negative Signals	864
20.11	So, What Is Ethnic Security?	865
20.11.1	Definition—Ethnic Security	865
20.12	Summation	865
21	Environmental Security (Envirosec) (e_{s4})	869
21.1	Introduction	870
21.2	Environmental Security—Setting	871
21.3	Challenges to Environmental Security	872
21.3.1	Population Growth and Environment	873
21.3.2	Developmental Projects	873
21.3.3	Resource Usage	874
21.3.4	Terrain Abuse	874
21.3.5	Incidents of Disaster	876
21.3.6	War and Military Preparations	877
21.3.7	Militant Activities	878
21.3.8	Unlawful Activities	878
21.3.9	Hazardous and Toxic Materials	879
21.3.10	Legislation and Enforcement	879
21.3.11	Global Warming	879
21.3.12	Climate Change	885

24.2	Microbiomic Security: Setting	993
24.3	World of Human Microbiome	995
24.4	Players and Stakeholders	1000
24.5	Role and Script: Microbiota	1003
24.6	Microbiome as Health Guard	1006
24.7	Human Microbiome Project	1007
24.8	Yuck Factor	1008
24.9	Maintaining Human Microbiome	1009
24.10	Managing Dysbiosis	1010
24.11	Counting Human Microbiome	1010
24.12	Terrain Relativeness: Microbiome	1010
24.13	Host Relativeness: Other Life Forms	1011
24.14	Microbiomic Ethics	1012
24.15	So, What Is Microbiomic Security?	1013
24.15.1	Microbiomic Security: Definition	1014
24.16	Summation	1014
 Part III Strategising National Security		
25	Trendlines in National Security	1019
25.1	Introduction	1019
25.2	About Trendline	1024
25.3	Contrasting Perspectives	1025
25.4	Change and Adaptability: Chance Theory Paradigm	1027
25.5	Dilemma of National Security Concept	1027
25.6	Evolution and Changes	1031
25.7	Governance and Organs	1032
25.8	Elements: Changes and Interplay	1037
25.9	Elements and Terrain Specificity	1038
25.10	Changes in National Security Environs	1038
25.11	Global System and Globalisation	1038
25.12	Hierarchy of Nations	1040
25.13	Power of Superpower	1041
25.14	Nation-Centric Application of National Security	1047

25.15	Premising Nations Under Continuum Principle	1052
25.16	Premising Nations vs. People	1053
25.17	Twenty-First-Century Paradigm of National Security	1054
25.18	Summation	1056
26	Strategic National Security and National Security Strategy	1059
26.1	Introduction	1059
26.2	Strategy	1063
26.2.1	Origin and Appreciation of Strategy as a Term	1065
26.2.2	Tactics	1070
26.2.3	Strategy and Tactics: Difference	1072
26.3	Strategic National Security: Continuum Approach	1076
26.3.1	Vision, Mission and Intervention	1078
26.4	National Security Strategy	1079
26.5	Steps in Strategy	1081
26.6	Measuring Strategic Yield	1082
26.7	Strategic Role of Government	1083
26.8	Strategic Integration of Elements	1084
26.9	Strategic Integration of Terrains	1085
26.10	Strategic Integration of Elements and Terrains	1086
26.11	Why Strategies Fail?	1086
26.12	Summation	1087
27	Tradeoffs in National Security	1091
27.1	Introduction	1091
27.2	Governance and Tradeoffs	1095
27.2.1	Well-Being	1096
27.2.2	Checks and Balances	1098
27.2.3	Rule of Law	1101
27.2.4	Human Rights	1102
27.2.5	Patriotism and Treason	1102
27.2.6	Equality and Efficiency	1103
27.2.7	Individual Privacy	1105
27.2.8	Safety and Security	1106
27.3	Factors that Affect Tradeoffs in National Security	1106
27.4	Balancing Tradeoffs	1109
27.5	Cost of National Security	1110
27.5.1	Welfare State and Free Dolling	1114
27.5.2	Tax and Taxpayers' Money Argument	1116
27.6	Reality of Tradeoffs	1118
27.7	Summation	1120

Part IV Examining National Security

28	Researching National Security	1125
28.1	Introduction	1125
28.2	Purpose of Research in National Security Governance	1129
28.3	Anatomy of Destinations	1131
28.4	Modelling National Security	1133
28.5	National Security—Moving Destination	1135
28.6	Interactive Matrix of Elements	1138
28.7	Interactive Matrix of Terrains and Elements	1141
28.8	Modelling Elements and Terrains	1142
28.9	Doctrinal Approach—National Security	1143
28.10	Strategic Mapping for National Security	1146
28.11	Follow on Organograph	1148
28.12	Models and Modelling	1150
28.13	About Biomodel	1152
28.14	About Inkblot Model	1154
28.15	Models and Community	1155
28.16	Decision Making and Analysis	1155
28.17	Vitals of National Security	1158
28.17.1	Chance	1158
28.17.2	Chaos-Entropy Mix	1160
28.17.3	Intuition	1161
28.18	Summation	1163
29	Research Factors and Questions: National Security Governance	1165
29.1	Introduction	1165
29.2	Questions in Research Process	1167
29.3	Research Factors	1171
29.3.1	Human System Specificity (Factor #1)	1172
29.3.2	Concept of National Security (Factor #2)	1175
29.3.3	Threat Perception and Analysis (Factor #3)	1178
29.3.4	Elements of National Security (Factor #4)	1179
29.3.5	Conditions of National Security (Factor #5)	1180
29.3.6	Terrain Specificity (Factor #6)	1183
29.3.7	External Rudiments (Factor #7)	1183
29.3.8	National Governance (Factor #8)	1184
29.3.9	Modelling National Security (Factor #9)	1184
29.3.10	Assessing National Security (Factor #10)	1185
29.3.11	Indexing National Security (Factor #11)	1185
29.3.12	Auditing National Security Governance (Factor #12)	1185
29.3.13	Futuristic Impact Assessments (Factor #13)	1185

About the Author

Prabhakaran Paleri was a former Director General of the Indian Coast Guard with naval, customs and corporate background. He is an alumnus of the National Defense University, Washington, D.C. (Hall of Fame). He has researched and authored various books and papers on strategic and corporate subjects. Presently, he is an academician, researcher and discussant in his fields of expertise and interests including governance by national security, the term he examines in this study. His previous book for Springer was “Human Investment Management: Raise the Level by Capitalising Human (2017)”.

He lives in Kozhikode, Kerala, India.

Abbreviations

3TG	Tin, tungsten, tantalum and gold
a.k.a.	Also known as
ABMT	Anti-Ballistic Missile Treaty
ADR	Alternate dispute resolution
AED	Acute existential dread
AI	Artificial intelligence
AIDS	Acquired immune-deficiency syndrome
AIIMS	All India Institute of Medical Sciences
AIS	Automatic identification systems
ALS	Amyotrophic lateral sclerosis
APL	Assured prospective loss
ARA	Authority, responsibility and accountability
ARV	Anti-retroviral
ASD	Autistic spectrum disorder
ATC	Air traffic control
ATM	Asynchronous transfer modes
b/d	Barrels per day
BBC	British Broadcasting Corporation
BC	Before Christ
BCE	Before Common Era
BESBA	British Eastern Sovereign Base Area
BFSR	Battle field surveillance radar
BIOT	British Indian Ocean Territory
BIS	Biometric identification system
BM	Biomodel
BMI	Body mass index
BOE	Barrels of oil equivalent
BSF	Border Security Force
BTU	British thermal unit
C-19	Covid 19, the corona virus disease

C ²	Command and control
C ⁴ I	Command, control, communications, computers and intelligence
C ⁴ ISR	Command, control, communications, computers, intelligence, surveillance and reconnaissance
CAB	Citizens amendment bill
Cal-Val	Calibration and validation
CAV	Common aero vehicle
C _b	Cumulonimbus
CBA	Cost-benefit analysis
CBM	Confidence-building measures
CE	Common Era
CEAHAT	Centre for Enquiry into Health and Allied Themes
CEG	Centre of economic gravity
CEO	Chief executive officer
CFR	Code of Federal Regulations
CH ₃	Methyl group
CIA	Central Intelligence Agency
CIA	Confidentiality, integrity, availability (cyber security triad)
CID	Chance-induced disaster
CIG	Central Intelligence Group
C _{ns}	Centroid of national security
CNS	Coast of national security
CO ₂	Carbon dioxide
COG	Centre of gravity
COR	Corporate ocean responsibility
CPI (M)	Communist Party of India (Marxist)
CRS	Control, resistance and submission
CRT	Cathode ray tube
CSR	Corporate social responsibility
CTBT	Comprehensive Nuclear-Test-Ban Treaty
CTF	Cyber threat framework
D.C.	District of Columbia
DA	Decision accelerator
DALE	Disability-adjusted life expectancy
DCE	Direct-covert-external (threat)
DCI	Direct-covert-internal (threat)
DCTE	Data circuit terminating equipment
DIA	Defense Intelligence Agency
DIPR	Defence Institute of Psychological Research
DIY	Do-it-yourself
DIYGP	Do-it-yourself genome policy
DNA	Deoxyribonucleic acid
DOE	Direct-overt-external (threat)

DOI	Direct-overt-internal (threat)
DRC	Democratic Republic of Congo
DTE	Data terminal equipment
$E=MC^2$	Mass-energy equation of Albert Einstein
EC	European Community
ECSA	European Conference on Software Architecture
ED	Existential dread
EDS	Economic defence spending
EEZ	Exclusive economic zone
EI	Electronics intelligence
EMR	Electromagnetic radiation
ENMOD	Environmental Modification Convention
ENT	Ear, nose and throat
EOD	Earth Overshoot Day
EPO	Epoetin alfa (Erythropoietin drug)
ESA	Extended seabed area
ESI	Economic security indicators
ET	Extraterrestrial
EU	European Union
FAO	Food and Agriculture Organisation
FDA	Food and Drug Administration
FISHCODE	Code of Regulations for Sustainable Fisheries
FLIR	Forward-looking infrared radar
FLOPS	Floating point operations per second
FMT	Faecal microbiota transplantation
FOIA	Freedom of Information Act
FOS	Foot of slope
FRS	Frame relay standard
Ga	Gallium
Ga	Gigaannum
GBNS	Governance by national security
GC	Geneva Convention
GCF	Global Challenges Foundation
GDP	Gross domestic product
GDS	Gross domestic savings
Ge	Germanium
GEF	Global Environment Facility
GEG	Global energy governance
GEO-3	Global environmental outlook 3
GGI	Good governance index
GHG	Greenhouse gas
GHI	Gross happiness index
GI	Gastro intestinal
GIS	Governance information system

GLOF	Glacial lake outburst flood
GM	Genetically modified
GMO	Genetically modified organisms
GNH	Gross national happiness
GNP	Gross national product
GoM	Group of ministers
GP	Genomic privacy
GPS	Global positioning system
GSGI	Global security governance and intervention
GUD	Global Unity Day
GWAS	Genome-wide association studies
HCV	Hypersonic cruise vehicle
HDI	Human development index
HDR	Human development report
HGDP	Human Genome Diversity Project
HGI	Human Genome Initiative
HGP	Human Genome Project
HI	Human intelligence
HID	Human-induced disaster
HIM	Human investment management
HIMI	Heard Island and McDonald Islands
HIV	Human immunodeficiency virus
HLM	History, legend and myth
hMM	Human milk microbiome
HMP	Human Microbiome Project
H _n	The nth human (sapien)
HNS	Hazardous and noxious substances
HO ^{••}	Hydroxyl or hydroxide in chemistry
HRD	Human resource development
HRM	Human resource management
HTML	Hypertext markup language
HTTP	Hypertext transfer protocol
HWB	Human well-being
IB	Intelligence Bureau
IBD	Inflammatory bowel disease
IBM	Inkblot model
ICC	International Criminal Court
ICE	Indirect-covert-external (threat)
ICESCR	International Covenant on Economic Social and Cultural Rights
ICG	Indian Coast Guard
ICG	International Crisis Group
ICI	Indirect-covert-internal (threat)
ICMR	Indian Council of Medical Research
ICRC	International Committee of the Red Cross

ID	Internally displaced
IDP	Internally displaced people
IDSA	Institute of Defence Studies and Analyses
IEEE	Institution of Electrical and Electronics Engineers
IFME	Interfacial marine environment
IHMP	International HapMap Project
ILO	International Labour Organisation
IMF	International Monetary Fund
IMO	International Maritime Organisation
IMST	Incident management support team
INCDIS	Incident of disaster
INDOEX	Indian Ocean Experiment
INS	Indian Naval Ship
IOE	Indirect-overt-external (threat)
IOI	Indirect-overt-internal (threat)
IPCC	Intergovernmental Panel for Climate Change
IPKF	Indian Peace Keeping Force
IPO	Input-process-output
IPPC	International Plant Protection Convention
IQ	Intelligence quotient
ISDN	Integrated service digital networks
ISO	International Organisation for Standardisation
ISS	International Space Station
IT	Information technology
IUU	Illegal, unregulated, unreported
JCS	Joint chiefs of staff
KEI	Kinetic energy impactor
KRC	Kargil Review Committee
L2S	Lean, lethal and silent
L2S-ZC	Lean, lethal, silent and zero-casualty
LAN	Local area network
LCS	Legal continental shelf
LGBTQIA+	Lesbian, gay, bisexual, transgender, queer, intersex, queer, asexual and others
LHM	Legend, myth and history
LML	Live-mutate-live
LOC	Line of control
LoI	Law of invariance
LoL	Law of limitations
LON	League of Nations
LTL	Low tide line
MAD	Mutually assured destruction
MAN	Metropolitan area network
MARPOL	International Convention for the Prevention of Pollution from Ships

MAV	Micro aero vehicles
MCS	Monitoring, control and surveillance
MCSR	Monitoring, control, surveillance and response
MEPC	Marine Environmental Protection Committee
MIC	Methyl isocyanate
MIPS	Million instructions per second
MLH	Myth, legend and history
MSV	Mobile surveillance vehicle
MVC	<i>Mahavir chakra</i>
NAFTT	North Atlantic Free Trade Treaty
NASA	National Aeronautics and Space Administration
NATO	North Atlantic Treaty Organisation
NBC	Nuclear, biological and chemical
NCW	Netcentric warfare
NDC	National Defence College
NDPS	Narcotic drugs and psychotropic substances
NEC	Necrotising enterocolitis
NGO	Non-governmental organisation
NHGRI	National Human Genome Research Institute
NIA	National Intelligence Authority
NIC	National Integration Council
NID	Nature-induced disaster
NIH	National Institutes of Health
nm	Nautical miles
NS	National security
NSA	National Security Act
NSAB	National Security Advisory Board
NSC	National Security Council
NSCAB	National Security Council Advisory Board
NSI	National Security Index
NS _{max}	National security maxima
NSS	National security strategy
NVD	Night-vision devices
O ₃	Ozone gas
OCD	Obsessive-compulsive disorder
ODA	Official Development Assistance
ODS	Ozone-depleting substances
OPEC	Organisation of the Petroleum Exporting Countries
OPRC	Oil pollution preparedness, response and control
OS	Operating systems
OSI	Open-system inter connection
P ³ C	Protection and preservation of natural environment and prevention and control of environmental pollution
PAD	Policy-activated disasters

PC	Personal computer
PDN	Public data network
PFLOPS	100 peta floating point operations per second
pH	Potential of hydrogen/Power of hydrogen
POW	Prisoner of war
ppm	Part per million
PSSA	Particularly sensitive sea areas
PSYOPS	Psychological operations
PTI	Press Trust of India
QED	<i>Quod Erat Demonstrandum</i>
QOL	Quality of life
R5	Resource five (<i>air, water, food, shelter and shored-up energy</i>)
RAD	Resource-activated disasters

In Quest of National Security: World
of Sapiens

Chapter 1

Humans and Human Systems: Shifting Centroid of National Security

“The demanding Proteus (The word originated (1594) from the reference to the imaginary Greek sea god Proteus (son of Oceanus and Tethys), who could change his form, thus displaying great diversity or variety in behaviour like the sea. The term is often mentioned in behavioural sciences as protean behaviour. The term has a great take in explaining human behaviour associated with the national security concept, the author believes. <https://www.merriam-webster.com/dictionary/protean>. Accessed 7 August 2008.) in every human complexifies the dynamically shifting centroid of national security”

1.1 Introduction

National security (NS)¹, in this study, is the ultimate concept of well-being of people of a geopolitical entity by governance (Paleri, 2002).² Such a geopolitical entity is the highest formal human system that is legally, socially, politically and independently governable and thereby called a “nation” for the purpose of national security studies, though the meaning of “nation”, legally and geopolitically, may be perceived and interpreted differently. National security is a compound term with the characteristics of an open compound word, evolved by usage and, thereby, different in exactness from the connotation attributed by the constituent words: nation and security. It is neither about “nation” nor about “security” as they are perceived disjointedly. It’s much more in meaning. The concept is still evolving. As it stands evolved, national security goes far beyond the normally considered physical security. This is important to understand. It is about the wholesome well-being of the people of a “nation”. The term “nation” in this study is reiterated as a governable formal human system that is identifiable as a geopolitical entity. This needs to be understood. It will contain multitude of human systems as subsystems and sub-sub-systems starting with a family, the smallest in the profile of social life. Within this meaning, global security, if and when the global human system is considered for governance as a unitary human system, also falls under the principles of national security governance, if wholesome well-being is the overall objective. Presently, the global human system is not a system sans a firm system boundary. That makes a nation or geopolitical entity the largest human system for national security governance.

Providing national security is the prime duty of the government of a nation in whatever form and type it may be. Governance in this study means the formal entity established and authorised by the people, through involvement and participation by acceptance or non-acceptance, either as an agent of the people or themselves under considered authority in the absence of a formal agent, to govern the system for the people. The rule of the people through an agent is termed democratic and in the absence of an agent as anarchy. This has been reiterated and explained subsequently to reaffirm the outlook of this study on national security governance. Various forms of government other than anarchy explained in political science are equally recognised but brought under democracy as different types since in every rule people are involved actively or passively by acceptance or non-acceptance. Democracy to

¹The abbreviation NS for national security is considered more for convenience of usage in mathematical expressions and calculations than as literary expressions. For example, this study terms maximisation of national security as NS_{\max} .

²As brought out in the author’s multidisciplinary study titled *Concept of national security and a maritime model for India* for Ph.D. studies at the Department of Defence and Strategic Studies in the University of Madras in February 2002 and subsequently in his book *National security: imperatives and challenges*, published by Tata McGraw-Hill Publishing Company Limited published in 2008. The concept and theories are revisited in this study based on subsequent and continuing research studies in governance and human well-being.

that extent is more orderly than anarchy though it is not necessary for an anarchic rule to turn chaotic all the time.

The functional role and duty of the government (Box 1.1) is governance aimed at maximising the well-being of the people as an ongoing process in perpetuity. But the governments may not target national security and well-being as the sole objective. This study is about governing by national security (GBNS) where well-being of the people is the sole objective. Along with it, dynamically and critically linked with governance, are the intermediary facets of national security: elements and terrain specificity and rule of law applied to them. All these make the job of a government increasingly complex in the modern world.

Box 1.1 Democracy³ and Anarchy: Different Outlook

For this study democracy is the rule of the people through a formal government where the government is an agent of the people. Anarchy is when the rule of the people is direct without an agent. In this statement every rule in a human system is considered by the people under participation of the people with or without consent. Democracy and anarchy are the two forms of governance. There are various “types” of governments under democracy. Anarchy is a form that is not typed.

The principles of national security, as it stands today, have wider applications as they can be carved to fit not only a geopolitical entity but also other formal human systems, global humans and corporates included. The idea of national security can be transferred similar to the principles of transfer of technology and applied to the governance of such systems. But its central tenet is the nation (Box 1.2).

Box 1.2 The Central Tenet of National Security

The central tenet of national security is the overall well-being of the people of a geopolitical entity, a nation in this study—the premier formal and governable human system. Therefore, it is imperative to understand them in clear perspective before examining the stasis of the concept as evolved. The task is strenuous. It is similar to reckoning the waves on an ocean, riding over them.

Maximising national security is not only possible but also challenging. It requires a fair knowledge of modern humans—the sapiens—and their behaviour.

³In the original sense, the term “democracy” combines two Greek words *demos* meaning whole citizen living within a particular city-state and *kratos* meaning rule. A belief in shared power: based on a suspicion of concentrated power (whether by individuals, groups or governments).

1.2 Studying Sapiens by Sapiens

The only species on the planet (for now) who study humans are humans themselves. That is a paradox. There is no chance for a second (superior) species opinion. So it remains a kind of evaluation of sapiens by sapiens all along.⁴ Interestingly, there is a slender twist in the narrative at the start itself. The focus of study is on the “other human”; self is not included. Self is normally kept external to the study on humans. This is evident even in every “how to. . .” literatures and oral advices on matters of self-development, self-realisation and so on. Everyone wants the other person to improve. The stockbroker doesn’t normally invest in shares he or she recommends! There are many branches of studies of self-understanding through others—counseling, personality development, change and “how-to-howdy” advisories. A surgeon performs surgery on “others”, not on self. Of course, it is crazy to cut and sew oneself. That is the way it is. Similarly, humans look at humans as other individuals, not as a replica of self.⁵ It is in the human habit to advise others. Even the scriptures and ancient gospels advocate the ideological texts for well-being.

The study on sapiens by sapiens can become judgemental. Every human is scared to the hilt and can resist attempts to change. That perhaps is the reason why one advises the other. Perhaps the advice meant for the other could ultimately be for the subconscious self under the assumption things will be better for self than others—rationalisation of survival pangs under existentialistic drudgery. This is exactly where the governments have to hit the nail if serious about governing people.

In any such studies of sapiens by sapiens, there is an “up-down” association. It is an interesting relationship. It is the relationship between the researcher and the subject.⁶ There are similarities in such relations—doctor and patient, master and servant, teacher and student, interviewer and interviewee and so on. The researcher feels “superior” to the subject of study as a finder (a seeker) under pretext of a prospective knower. That is the gradient on which the researcher moves while taming the topic. The researcher, or rather the examiner, stands elevated and prepared in relation to the subject. This stance helps the thought process to flow unhindered by any ideated inadequacy of the researcher vis-à-vis the subject of study.⁷ This is important in the state of affairs of a research activity. This relationship generates conflict of thoughts in a study of self by self. Self, the studied, is “inferior”

⁴In this book a sapien is the evolved and continuously evolving human of the day. This is further elaborated in Chap. 32.

⁵This is a general statement. A serious researcher on humans learns a lot from self. Author’s tribute goes to Carl Linnaeus (Carl von Linné) (1707–1778), the father of modern taxonomy, and also the “type specimen” for *Homo sapiens* (binomial name).

⁶In mathematical term this can be called a vectorial relationship—relationship with a directional explanation. In fact every human interactive relationship is a vector, not a scalar. The relationship can also be quantified in terms of intensity. This way human interaction of any kind becomes vectorial.

⁷The ideated inadequacy could also be the root cause of falsifiability in research findings. Falsifiability is an essential requirement of research for knowledge enhancement by further research.

to the self who studies it, by ideation. It generates a catch with a gap that gets filled with prejudice in quick reflex. Prejudices mar exactness of study and thereby affect the truth in the outcome. Hence, “I” is not a subject of human study for “me” like the way “he” is. It will never be: I shall never understand me. There lies the big catch. Scriptures, sacred texts, philosophers, religious honchos and scientists talk about it. But, they can’t crack it. Not their fault, but default..., believes the author.

“Who am I?” is a “big question”⁸ compared to “Who is he?” Such questions fall in the genre of “Is there God?”, “Why are we here?”, “What is the purpose or *raison d’être* or, as the Japanese say, *ikigai*”⁹ of my life?” kind of inquiries. It is there in every human system. Well, there is answer for everything. There can be a million answers to these questions; it can be said with a tad bit of gratis exaggeration. But, answers to them can echo baloney at times. Humans conveniently avoid or stealthily slip the questions of similar kind under the unknown. Some attribute such enquiries to higher levels of learning or thinking. It’s convenient that way. But, in actuality, the answers we seek for decision-making are those that meet the ground reality of natural living. This means the questions should support prospecting comprehensible answers, especially when it is a matter of governing human systems. Can one say, “Never ask a question that has no answer”?

Identifying the right questions is critical to finding the right answers. Right answers and semantic consensus among participants are critical to decision-making in a social system. Semantic dissonance, where one doesn’t understand or misunderstands the other, mars the purpose.¹⁰ Decision-making is critical to governance. There are many limitations in doing so in matters human.

Humans haven’t been able to make much headway in the pursuit of understanding themselves. They are still making attempts to fish out the oversized black box sunk in the bottom of the ocean of awareness knowledge. They are not abandoning their efforts; that’s good news. There are many questions that need answers. Many more questions will originate in times to come. This provides room for storing varied information as research findings on humans and human systems. There are loads of them already. The pursuit continues. In this effort, it is fairly essential to pay tributes to the scholars and researchers of the past. Each finding stacks another step to stand on and reach out to the new. As the process continues, humans conclude “what they are” according to “where they reached” in their studies combined with or necessitated by their belief systems of the moment. In spite of new findings, people are

⁸The term is borrowed from author Stephan Hawking’s excellent usage of the unknowns in the title of his book *Brief Answers to the Big Questions*. John Murray, 2018.

⁹*Iki* means life, *gai* means motive in Japanese. Together the term means the purpose of life; a reason for being. Does an individual human have an *ikigai* known or unknown to him or her? In the individual pretext, the *raison d’être* for life is life itself, according to the author.

¹⁰Semantic dissonance can be taken as the understanding or misunderstanding of terms used in a communication process between senders and receptors. There will be a dissonance between the sender and the receptor under semantic dissonance causing conflict in decision-making. Semantic dissonance can be natural and deliberate. The parties may be aware or unaware of it.

conditioned to believe what they feel, even if it is a phantom appreciation.¹¹ The phantoms in the brain make the humans “what they are not”.¹²

All belief systems (Box 1.3) are justified in the vastness of majority intellect. Humans find it easy to carry on that way. The conflict between reality, unreality and abstraction either perceptive or insensate is real and present in a human system. Therefore, it has to be accepted in governance.

Box 1.3 Belief System Travesties

Belief system is generally said as a set of principles or tenets which together form the basis of a culture, religion, philosophy, ideology or moral code. But it is much more than those in national security studies. It is considered belief system originates from the mental process cued and stimulated by the survival pangs, especially the inherent insecurity as the driver. Belief system doesn't get refined under research findings but drives subsequent activities in life individually or in groups. There are many travesties of belief system such as “belief system is blind faith” that further aggravate to superstition leading to radicalism, militancy and so on. This study doesn't subscribe to such views and considers behaviour of a human is based on the conditioned script during upbringing that reflects the individual mental stasis at the time of behaviour that defines human personality unless it has been modified by the individual subsequently, internally. It is rare. In this statement human personality is taken as behaviour at a particular time.¹³ It also means personality can change, but belief systems remain.

The bottom line is that humans and human systems are struggling to decode themselves to the end. The shade of the box is still black. Perhaps they may need a superior species to tell them what and who they are. Till then there is no other choice, but to appreciate selectively as is being done now. In other words, that's how it's going to be. Simply put, it is the way of the sapien world; the way it's gonna go by selective appreciation.

The dilemma, the curse of selective appreciation, will be evident in this study too. It cannot be avoided. The task is to arrive at a conclusion to examine how humans and human systems can be managed or, more so, governed for a better living. The selective appreciation here is not based on blind belief, but serious inquiry with a purpose. The purpose is to break down the concept of national security for better

¹¹ Unreal appreciation which the appreciator refuses to believe is wrong. See Blakeslee, S. & Ramachandran, V.S (2015). *Phantoms in the brain*. Harper. The authors explain certain neurological phenomena, their relationship to physiological mechanisms and their integration with philosophy of mind in the overall belief system deficits.

¹² Author's explanation.

¹³ The characteristics of an individual human are embodied in the individual's personality which is behaviour at a particular time. See Paleri, P (2018). *Human investment management: raise the level by capitalising human*. Springer Nature Singapore Pte Ltd. p. 61.

understanding prior to engaging for implementation and intervention. This is important as the term national security is mentioned everywhere in the circle of national and global governance today. It is not confined to an academic or political niche in the modern world. The effort to break down the concept to examine it relative to the subjects can be compared with dismantling a complex gun for maintenance or training, and later reassembling for usage. That too blindfolded. It is not a reductionist activity.

1.2.1 Rationale for Governing Sapiens

Maximising national security is the rationale for governance; it is the duty of the government. Indexing geopolitical entities by national security will aid in comparing them relative to a particular time or period. It will answer the question: “Who is ahead of whom in well-being today?” Well-being is time functional.

However, the concept needs to be studied seriously before any such change can be made. Understanding humans and human systems is vital for examining how to govern them. The leading lemma in this process is the belief that humans and human systems can be governed towards maximum well-being even if the black box remains black.

This process rides the vital consideration that human beings, collectively as a life form, are unidimensional in nature with universally acquired and continually modified individual behaviour signatures that differ from person to person as well as within individuals as a function of time. Simply put, humans are identical to and different from each other. The contradiction in this statement is central to understanding humans. Human system reflects the contradictions in a better hue. The appreciable fact is that human system, as they are, supports contradiction, not contrast. The contrast is between life forms. If this is consented, the job has just begun.

The contradiction in human system can be explained by introducing two new terms in human appreciation: singularity and differentiability (Box 1.4). In the national security context, the two terms are apposite, not opposite, to each other. They evolve from the supporting contradiction thus mentioned—resemblance over divergence.

Box 1.4 Similar and Different—Contradicting Humans

Humans are similar, but different. Other life forms are similar, not different. This is from the sapien view of sapiens. The terms to explain this “similar-but-different” phenomenon are singularity and differentiability.

Humans exhibit both traits in their personality.¹⁴ The argument can be repeated more sagaciously to provide clarity of perception. The singularity of humans laced with the differentiability of manifold behaviour traits and attitudes is what makes them unique in design as a life form. Other life forms do not exhibit the trait of contradiction. Humans have similarities with other life forms; one should admit, within the naturally acquired divergence, whether selective or otherwise. But that doesn't approve righteous claim to other life forms for humanistic conversion. Understanding and accepting the singularity of humans within the universally divergent behaviour signatures are important to appreciate the concepts of national security and governance examined in this study. There are many critical questions to examine, answer and record prior to exploring and confirming the idea of national security. Before that, one may peep, a bit more, into the idea of singularity and differentiability in human bioscape. That is what a ninja does, before taking the next step, silently to make the approach invisible to the target.

1.3 Singularity and Differentiability in Human Context

Singularity is not a complex word. It is widely used to communicate various expressions in diverse fields of study. It can get mixed up in usage and meaning causing semantic dissonance, mentioned earlier. "Singularity" is a key term in physical sciences, more specifically in cosmology. The term is used in the explanation of black holes, space-time curves and other related concepts. It is borrowed and transported to this study to explain the sapien stasis where the idea of differentiability needs to be introduced in human application of national security. It is not similar to singularity in cosmic science though human life, in a way, is cosmic in reality. Physics rules; there is a difference, though.

In the present context, singularity is used to express the nature of humans and human systems in a singular posture—unidimensional behaviour that is applicable to all. It means they, the humans, are singularly identical. A human is identical to another under the organic singularity perspective. Or more technically, human and human systems lap dissolve into a stasis of singularity whether being together or standing separate. Every human merges into another as a unitary human or a member of a human system in organic characteristics and corresponding behaviour. The very process of service in a human system is based on the principle of singularity—one individual is replaced with another. One is considered equal to the other under such situations. Equality and equity in human management and the hue and cry for human rights preservation, etc., are based on singularity principles. In employment, the output or productive return of an employee need not be exact to that of the one who is replaced. The singularity between a human with another human and a human system with another human system is the basis of activities observed in a functional

¹⁴ See note 12. Personality of a human, being behaviour, can change with respect to time.

human,¹⁵ which everyone is, unless differentially abled.¹⁶ This is also applicable to every human system.¹⁷ Singularity is visible in every life form and life system. Every life form has its own specific singularity feature. The basis of biological classification of life forms is driven by the singularity aspect though the parameters of classification are based on the taxonomic order for convenience. But there is a difference in the singularity thus mentioned about other life forms and the singularity expressed about humans. They are not alike. There lies the catch.

It means humans are not similar to other life forms and, hence, cannot be compared with them. That's where the game changes.

1.3.1 Humans Are Disparate

Everything about humans is concluded only by humans. Humans never think about it when they conclude. Lucy,¹⁸ the cartoon character in Charles M. Shultz's¹⁹ Peanuts series, characterising a group of children, tells to Schroeder, the object of her unrequited love, "It is a scientific fact that girls are smarter than boys". She continues her chatter while Schroeder, the budding musician, was busy on his toy piano, "And do you know who discovered it?" "Women scientists!" she concludes.²⁰

Who else can say humans are different? Only humans. . .

The differences from other life forms make humans unique. There is "something" in humans that is not there with other life forms from the perspective of this study. This digression is termed "differentiability" in this study. This digression extends to humans as a whole within them and between them. It reflects on their personality. Differentiation is also a complex word, more so in mathematics. Of course, mathematicians find it easy. Differentiation comes out of derivatives for a system that is continuous. That means something that transforms with respect to time. The life forces, though common in every human and hence carries the attribute of singularity, drive humans and associated human systems to assume shift (not split) personalities

¹⁵ A functional human in this study means a human whose neurological system is functional and not dysfunctional. The individual is functionally abled mentally even if there are physical restrictions.

¹⁶ See Paleri, P (2018). *Human investment management: raise the level by capitalising human*. Springer Nature Singapore Pte Ltd. p.74.

¹⁷ Scholars of artificial intelligence also use the term singularity to explain the assimilation of humans with artificial intelligence one day. The situation arises when humans transcend biology according to them. See Kurzweil, Ray. (2008). *The Singularity is near: when humans transcend biology*. Duckworth Overlook. Singularity in this book is with respect to human to human assimilation in comparison and based on human intellect.

¹⁸ Lucy van Pelt, "the know all" sister of Linus and Rerun, the cartoon characters.

¹⁹ Charles Monroe "Sparky" Schulz (1922–2000) was an American cartoonist and creator of the comic strip Peanuts.

²⁰ Peanuts comic strip. United Feature Syndicate, Inc. http://cathiesflashportfolio.itgo.com/Peanuts_Lucy_Schroeder_Storyboard.htm. Accessed 12 March 2018

in a protean posture.²¹ In the ordinary carry-on-life mode, every human behaves differently at all times even under similar situations and conditions. Their biological signatures are different though their biological existence follows identical formats. It is a kind of acceptable polarity (is there a choice?). It is this behaviour and the personality associated with it, among others, that make sapiens different from other life forms. Imagine a scene of agitation where two groups—the agitators on one side and the enforcers on the other—behave differently under the same situation. At the same time, the “clash” is singular—unidimensional. This is a daily scene in every formal group—family, government, nation and others. This differentiability within the singularity makes humans and human systems unique and complex for the purpose of governing them. They don’t follow the rules of other life forms. Governance doesn’t follow the cowboy or shepherd syndrome. It has to handle multiple behaviour patterns in the singularity domain of the human system. Every individual behaves differently from not only each other but also from itself with respect to time. It is composite. It is difficult to govern. Telling to the marines won’t help.²²

Singularity, in its general meaning, is about the exclusive traits of a species that binds it together. Differentiability is the differentiation within the species in spite of the singularity which is now observable only among humans. Singularity covers a species as the exclusive trait; differentiability is within a species. It is considered an exclusive human trait at the moment in this study. There is no serious study on this aspect in other species. For this reason one needs to look at the singularity theory among humans differently from that among other life forms. The other life forms are not modified by their singularity; instead they are singular as a species. Singularity is not recognisable among sapiens without differentiability sashaying along. Humans are defined by their singularity that stands together with their differentials. The prime condition for recognising human singularity is the associated differentiability. It is this association that generates human personality and corresponding behaviour patterns. It is a kind of blue or green screen principle in special effects in visual media—clarity under difference.

²¹ See note (The word originated (1594) from the reference to the imaginary Greek sea god Proteus (son of Oceanus and Tethys), who could change his form, thus displaying great diversity or variety in behaviour like the sea. The term is often mentioned in behavioural sciences as protean behaviour. The term has a great take in explaining human behaviour associated with the national security concept, the author believes. <https://www.merriam-webster.com/dictionary/protean>. Accessed 7 August 2008).

²² The phrase “telling to the marines” projects the marines as dumb and naïve, who will believe anything and follow orders as told. But in the present context, the author believes marines are one of the oft quoted examples in professional discipline and tactical capabilities for a rough task which others cannot execute with precision in a tactical scenario and capable to cut the Gordian knot of limitations. The marines in this context are the tough soldiers of any country over whom the government depends in extreme emergencies. In simple terms, for the author, a marine is anyone whom one will depend upon for a task that one cannot do but need to be done for survival. Here the author believes “tell it to the marines” could be seen in a new light as the last resort to survive a decisive situation. In other words one may “invoke the marines” when all the doors are shut. The government, in that case, could be the “marines” for the people.

In other words the term singularity never exists in a usage space sans the companion term differentiability if the study or discussion is about national security.

Many terms are used to explain an individual “differently” from another. One of them is individuality. Individuality is considered to be the distinguishable qualities of an individual from another. In this aspect the individual is considered separate from another—a distinct entity of sorts. But the individual’s individuality can also keep changing making him or her distinct from what he or she was respectively earlier. Otherwise why do clashes arise between two individuals who were fine with each other earlier, or why do people who clashed earlier come back later as close allies? Something changes people’s behaviour, their personality, continually. If that is so, can individuality be personality which is also connected with behaviour, functional to time? There is something interesting here.

A closer look will reveal individuality hints at the differentiability between individuals. But the term stresses on the fact that every human is different from another. Well, here the problem aggravates. In such case studying humans and human systems becomes improbable because individual human needs to be studied independently and separately. The problem is not serious. It is that individuality, if accepted, makes the approach to the issue of governance a bit gritty. In certain terminologies, individuality is also singularity. This complicates the find here—individuality may point out to differentiability among humans. Individuality, therefore, cannot be called singularity, at least in the study of national security.

It is iterated that semantics do matter, sometimes heavily, more so in decision situations. The term used to explain a particular process cannot be vague in decision-making. There should be *consensus ad idem* (identity of mind) among all involved about the terms and their meanings in decision-making and those subjected to such decisions. Therefore, it is imperative that humans and human systems are understood beyond semantic limitations without dissonance. One of the ways is to appreciate the terms and limit their usage with respect to situations.

Hence, more than what the two terms—singularity and differentiability—mean with reference to the humans and human systems, it is what they don’t mean that is relevant on immediate count.

First, singularity is not differentiability. It is also not the opposing term. They are neither synonyms nor antonyms. The terms appear only when a human or human system is subject to national security governance. The terms are recognised in this study only for the purpose of understanding national security and governing it. In this context, a human being and the system he or she belongs to are considered singular and differential concomitantly for the purpose of national security governance.

Human singularity, therefore, is the singularity exhibited by humans as the superior-most species in the life pyramid on the planet and through which they are studied under similarity in biological existence without assuming whether they transcend biology or not on a later date.²³ Human singularity in this context is considered a never-changing characteristic of humans as long as they remain in the

²³The idea of transcending biology was introduced by Ray Kurzweil in his book (2006) *The Singularity Is Near: When Humans Transcend Biology*. Viking Adult.

same species—sapiens, the present-day human. In this assessment, others in the *Homo*²⁴ *sapien* regime and now understandably non-existent (Neanderthals and their likes) are not included.²⁵

An important documentation at this juncture is sexual intercourse between *Homo sapiens* of different vectorial genus—the “up-down” or “before-after” genres of the same species. An example of such interbreeding is sex between Hominids and Neanderthals, Neanderthals and *Homo sapiens* and their likes. It is a kind of downtowner meeting uptowner on primordially passionate dates, most of them procreatively productive. It is a more or less established fact that such interbreeding had taken place and the present-day sapien may perhaps carry evidences of vectorial interbreeding of similar kind. If that is so, who are the humans—a continuum age band of cross genres within a species or cross species itself? Or a species tossed around by life’s most primordial and powerful force called sex that even survives the survived?²⁶ Heuristically it can be arrived at that humans not only had sex across their own differing genus but also with different species of the animal genus that were “intensely (sex) attractive” to the momentary sexual craving which experts may categorise as compulsive sexual behaviour or hyper-sexuality. The author doesn’t consider it a disorder. If that can be accepted, it shouldn’t be difficult to appreciate the kinky or aberrant sex some humans indulge in where even beasts or the dead are not exempted.²⁷ A man reportedly raped a dog in Mumbai, India, after tying its mouth. The dog lay bleeding at the end.²⁸ Where do these mindsets come from? Exact reasons are not easy to arrive at. Perhaps they can be attributed to evolutionary

²⁴It is important to note that the term *Homo* in *Homo sapiens* is of Latin origin meaning “man”, not the informal and offensive (disrespectable) term used in *Homosexual* man, which is of Greek origin.

²⁵There are authors who use the term singularity as a point at which human and machine intelligence will merge sometime in the future. See Ray, Kurzweil. (2005). *The Singularity Is Near: When Humans Transcend Biology*. London: Duckworth Overlook. It is different from the term used in this study of national security.

²⁶This term “survives the survived” is a phantom attribution meant to express the force of sex even over death—ghost sex, necrophiliac interactions including paraphilia, death worships, motile sperm extraction from the dead and various psychopathological diseases.

²⁷A news item on a murder of an unsuspecting woman in India mentioned about the brutal way she was slain when she resisted rape. It was a bestial crime. Police found the accused, Ameerul Islam, a migrant worker used to indulge in sex with goats and other animals regularly. Is it a differential behaviour with a long past in human genomic programming? “Kerala: Jisha murder accused in police custody for sexual activity with goat”. 15 July 2016. <https://www.deccanchronicle.com/nation/crime/150716/kerala-jisha-murder-accused-in-police-custody-for-sexual-activity-with-goat.html>. Accessed 12 February 2018.

²⁸“Maharashtra: Man held for having sex with dog in Thane.” http://timesofindia.indiatimes.com/articleshow/77185232.cms?utm_source=contentofinterest&utm_medium=text&utm_campaign=cppst. Accessed 7 November 2020. The 40-year-old man was arrested. One of the reports stated the man raped the dog. This study doesn’t call it a rape under the definition of rape. It is bestiality behaviour that this study finds as proof of cross-sex between *Homo* species when they existed in primitive times carried forward through genetic transportation. People have sex with dogs and other animals almost regularly. To avoid their jaws, fangs and claws (the survival tools), they cushion them one way or another as their intellectual survival tools permit. The man was charged

takeaways in the genomic terrain. Does it make such behaviour natural, being under irrepressible submission to the mega force of sex? Does sex matter in governance? Yes, very much. . . . Look around. Sex is the force vital (Box 1.5).

Box 1.5 Sex, The Force Vital

Sex is the force vital in the continuum of life. The interesting conclusion in this study is that if sexual urge is the strongest force then naturally it should trigger only between “sentiently identifiable similar” partners who are sexually opposite. Identifiable or perceivable is the key word. Therefore, the perversion (if it is) of bestiality is a peculiar neuro-intellectual trigger in the “initiator”, who will be (a human) superior relative to the victim in species typology. But actually the person is temporarily or permanently a low grade *Homo*. It also means if trans-sex was prevalent between *Homo sapiens* and Neanderthals, then the latter may be better explained as a subsystem as *Homo sapiens neanderthalensis*.

Geneticist Luigi Luca Cavalli-Sforza (1922–2018)²⁹ had mentioned about the farmers visiting the hunter gatherers, their upstream genus, in a downstream-upstream relationship sometime in archaeological history. He called it “demic diffusion”. Sometime later it was found that demic diffusion was not factual.³⁰ But it is a fact that sex didn’t find much of a “demic taboo” (author) in human life as the latter was a much weaker force compared to the sexual urge among “those looking similar, or felt similar” just for the purpose. Undoubtedly sex could be the fieriest of the forces which carves the singularity factor in humans as it transcends even into animals in many cases.

In spite of all these diverse and primordial formats, it is easy for governance if human life existence can be conglomerated within the twin traits of singularity and differentiability acting together at any given time, contradicting each other. This makes humans different from other life forms, the only kind so far. The key aspect of human singularity is that it exists only with human differentiability and vice versa.³¹ This makes contradictions natural to human system.

The study of humans in national security is the study of the present-day sapiens who are as singular as differential. It is not about what exhibited by *Homo sapiens* or other life forms even if traces of demic diffusions are visible in present-day human—the sapien. There is also a much talked about behaviour within humans—the protean

under Section 377 (unnatural offences) of the Indian Penal Code (IPC) and provisions of Prevention of Cruelty to Animals Act, 1960.

²⁹ Cavalli-Sforza was an Italian population geneticist who established demographic and migration patterns by studying blood groups.

³⁰ Who the humans are and where they come from.

³¹ Singularity cannot exist alone in humans. Singularity and differentiability exist together. This is how contradictions get legitimised (not explained in detail).

behaviour.³² It can complicate things further but can be tamed within the introductory find of this study—the singularity and differentiability stasis of the present-day sapiens.

It is the singularity that matters in the policies of governments (say, everyone needs health care); it is the differentiability that challenges the system under conflicting views (I want your health care but it is not satisfactory for me as I belong to the other political group or it doesn't give me the kick back or tradeoff if you introduce it). Both are symbiotic drivers of governance.³³

The story of national security in a human system begins here; it ends with the imperatives and challenges the present-day governance systems are exposed to with a lot of unfinished research agenda. In this attempt, the first look is at the human systems, the prime stakeholders of the concept of national security.

1.4 Human Systems

A system is a unified, complex and structural whole of a set of integrated, interactive and interdependent essentials within a defined boundary. Every system will have a boundary, which is important in system identification.

Within this parameter, the term human system has wide-ranging imports. A human system for this study is a collective of humans in groups with a formal objective in the geo-social parlance. Geography and sociology are shaped and reshaped by such human systems.³⁴ They are formal human collectives. Humans by nature are social entities. Therefore, they are socially interactive. The formal interaction often generates informally interactive groups as a derivative of the formal group. They are called informal groups in behavioural science. The differentiability is more visible in such informal groups or systems. The activities in informal groups will be different from those in the formal groups, sometimes plain opposite. Any human is a member of many such formal and informal groups, one within the other

³²Protean behaviour is sufficiently unsystematic to prevent a reactor predicting in detail the position or actions of the actor. The researchers named the behaviour from the shape-shifting Greek god of water, Proteus. In human resource management, people are considered to be Protean and traditional human (non-Protean). But in the book *“Human Investment Management: Raise the Level by Capitalising Human”*, the author considers every human with certain degree of Protean behaviour at different times. He calls them Protean human when such behaviour surfaces. See Paleri, P (2018). *Human investment management: raise the level by capitalising human*. Singapore: Springer Nature Singapore Pte Ltd. pp. 197-200.

³³In India the leader of a political party advocated to his followers in the party not to take a particular vaccine against COVID-19 as it had been considered initiated under the leadership of the ruling party. But he got it done for his family.

³⁴The reference is not to the biological human systems.

like the intricately carved and decorated Matryoshka doll³⁵ or an assorted toffee box, according to the system characteristics in an ideal mode of explanation. In reality there can be more than one within one (hence the toffee box explanation). Governments have to understand the disposition of the formal and informal groups within the ultimate human system, the nation.

The behaviour pattern of the individual and the group will be different under a given situation. According to a study on corporate environment (Paleri, 2018), humans behave in three distinct modes: (1) an individual, all by self, (2) collective (individual as part of a group and individual as self in a group but remaining a part of the group) and (3) the myriad combination of the two which is difficult to understand or appreciate.³⁶ Whatever may be the human system, formal or informal, people will behave differently, but not strangely, in one of the three roles in any given situation. The reasons are varied and complex. What matters in governance is the knowledge that human behaviour at any given time can turn unpredictable with supporting reasons.

A human system acts as a security blanket to the members. It is a perception. They are made by human consent under the instinct of “cuddling together” for security. It is direct or indirect. Security is the prime driver behind formation of a human system. The smallest human system, rather the first-line security blanket, is the family, and the largest is the nation, the nth line security umbrella, at the moment. The global human system “is not a system” but has the potential to become one, hence a probable or prospective human system. It will become one in the idealistic sense when the system boundary becomes clear and visible. It can only happen under permanent threat to security where security is wholesome—apparent as well as perceived, not physical alone.³⁷

1.5 Human Systems and National Security

National security, as a term, has affiliations with “nations”. Before examining the concept of national security (Chap. 2), it is important to understand what exactly human systems are. How are they different from each other? Here again one can stumble with semantics and associated conclusions in the prairie of geopolitical word list.

³⁵Matryoshka dolls, also called Russian nesting dolls, are a set of wooden dolls of decreasing size, one placed inside the other. Originally the largest doll was said to represent the strong female matriarchy of the Russian family, whereas the decreasingly smaller ones inside it were the rest of the family. The term Russian doll (Matryoshka doll) is used here to emphasise the fact of the “fertility” of groups or human systems and subsystems, one becoming fertile within another for mutual existence.

³⁶Paleri, P (2018). *Human investment management: raise the level by capitalising human*. Springer Nature Singapore Pte Ltd. pp.5.

³⁷Being explained later (Chap. 2).

Reverting to the term “geopolitical entity” may help to appreciate the human systems of the governing kind in the political sense—the apex systems that are independent or autonomous. A geopolitical entity is a human system entity with geopolitical interests. The geopolitical entities view each other in the geostrategic context in a competitive stasis. The posture between geopolitical entities is that of subliminal adversaries, not clear and visible but present in any interaction. In other words, the world comprises geopolitical entities in their extreme human system configuration each interactive with the other with an ultimate objective of doing better than the other. Every human belongs politically to one of the geopolitical entity and, in the nationality scenario, may associate with more than one of them. The better way to place this statement is that every human will belong to one or more geopolitical entities which also mean that there are no human on the planet without a recognised place to identify with. This is where the terms “stateless people”, “nobody’s people” or even “no man’s land”, “non-state actors”, etc. lose credibility in the geostrategic context. They become terms of convenience. This is also the reason to argue for a global security concept which presently is based on the greatly archaic and outdated collective security paradigm of the United Nations (UN). Every human belongs to multiple human systems which at the highest level is the geopolitical entity which the individual is identified with—the nation.

A nation (the term “national” in national security originates from it but assumes a different meaning subsequently) in this pattern of understanding is a human collective, hence a human system. How does one define a nation so that it is distinguishable and also identifies, as required for governance, with similar terminologies used to depict human systems—country, state, sovereign state, protectorate, kingdom, a people, peoples, supranation and so on? All such human systems comprise stable communities as visualised, not wholly unstable or anarchic groups, militants or militias or similar systems that for the time are not governable.³⁸ But, what’s the difference?

There are scholarly and legal definitions for a nation and other geopolitical entities such as states, countries, sovereign states and so on in vogue. Since these definitions do not seriously matter with the study of national security, as intended, it may be appropriate to examine selectively some definitions suitably modified to critically appreciate human systems as they are today and evolving. It is all about and relevant to this study—national security and governance.

First, the idea of a nation is looked at to get a foothold on other terms that depict human systems. This study considers the idea of a “nation” as the primary human system concept. The reasons are many. This doesn’t mean a nation is always larger than other systems of governance. For example, a country may comprise more than

³⁸ Such totally different systems cannot ideally exist independently, especially in the modern world under sovereign stasis. They may exist as subsystems within a geopolitical entity. The indigenous North Sentinel Islanders of India are examples. They do not allow any outsider into their territory. They are considered to be the world’s last Stone Age people who live in total isolation in their exclusive island which is one of the 572 islands of the Andaman Nicobar group of India in the Bay of Bengal. They exhibit dead end territorial instinct.

one nation or a nation may “flow” into another country also. The idea of a nation is considerably old. The origin is rooted in the Latin term *natio*- meaning “birth” which could mean, without much ado, *natural born people*³⁹ (author) that again means a collective of people who all agree and consider being together under various circumstances, environment and added commonalities. There is expected to be some kind of national bond among such people for reasons specific to the individuals within. This expression is important in understanding the system stasis further. It also matches with all the definitions about the idea of a nation and associated terms such as nationalism, nationalist and so on that resound in the present-day “national” cacophonies.

The term “nation” also means a group of people connected with high degree of singularity by origination seasoned by time. It represents large ethnic groups, geographical territories or group of people bonded by belief systems. As mentioned a brief moment ago, there can be more than one nation under a single government and also nations extending further into more than one governmental form. This will depend on individual citizen perception. The reasons why different terms are in use for expressing more or less similar formats of social systems under governance also speak for the differentiability among human social systems.

Nation in the word origin is pretty old extending to medieval times. Political philosophers extended various meanings to nation and nationalism. These are not considered important for this study on national security where “nation” is taken as a governable or governed geopolitical entity identifiable as one, subject to semantic consonance in decision-making especially in national security studies (Box 1.6).

Box 1.6 Does Semantics Matter in National Security Studies?

Semantics hold the key to verbal communication. Semantics matter in decision-making. National security is the end objective or goal of governance. Therefore the essence of the meaning of a word used in decision-making should be appreciated by all involved in it with clarity and identity of mind. There is no place for catch phrases in national security governance. Otherwise the decision model will be marred by semantic dissonance.

While the terms country, nation, state, sovereign state, nation-state and similar terminologies that depict human social systems are often used interchangeably, there are differences in semantic appreciation. Simply put, by random survey of literary

³⁹The term “natural born people” is used to avoid the citizenship factor in this statement related to the term “nation”. Citizenship matters only if the “nation” exists. A “natural born citizen” does not undergo naturalisation process to become a citizen. People can become citizens of a “nation” by naturalisation process. Certain constitutions may require natural born citizenship to hold prominent posts under constitutional law. The intention is to prevent foreign influence in national governance. But the origin of a nation is based on the surging demands of commonality of the people of such entities which need not be natural birth alone in a dynamic world.

comments, this book accepts them as follows for the considered study of national security with situational alterations as needed for governance:

- **A state** is a territory with its own institutions and populations.⁴⁰
- **A sovereign state** is a state with its own institutions, a permanent population, territory and government. It has the right and capacity to make treaties and other agreements with other states. A sovereign state has to be a de jure (by law and right) recognised entity. Most sovereign states are de jure (by law and right) and de facto (real and actual). This means they exist both by law and in reality.
- **A non-sovereign state** is a territory of a sovereign state, but not a sovereign state in its own right.
- **A nation** (explained earlier) in its regular sense is a large group of people that inhabit a specific territory and are connected by history, culture or other commonalities. Some nations are sovereign states; some are not.
- **A nation state** is a cultural group (a nation) that is also a state and may, in addition, be a sovereign state. People of a nation state ideally share a history, language, ethnicity and culture. But this can get diluted when demographic density increases through migrations and other means. Nation states are limited. Majority of nations in the world are stateless or states with partial nations—sliced nations, or composite nations with more than one nation as part of it. Majority of people born in the nation states share commonly the same ancestry and culture.
- **A nation without territory** comprises culturally homogeneous group of people which share a common language, institution, religion and other common features but has no territory.
- The word **country** can be used to mean the same thing as state, sovereign state or nation state in political science.
- **A supranation** is a union of multinational political entities where negotiated power is delegated to an authority by governments of member states. The term is sometimes used to describe the European Union (EU) as a new type of political entity. Supranation also brings in a term called supranational law in international law.
- **United Nations** is a human system collective entrusted with the collective security of its members, all considered and recognised as nations, in a global security perspective. Global security can also be modelled in line with national security. But United Nations obviously is not a nation even though it has recognised spatial occupation. It cannot be taken as a global human system or a representative system for it. It also means a nation can be a member but cannot be treated as a subsystem of the UN. This is a major difference. It also indicates many limitations of the UN.

Each of these entities is legal and has a great deal in common. Still they also carry their differentialities as a human system. From the perspective of the concept of

⁴⁰The word “state” is also used to refer to geographic sections of sovereign states which have their own governments but which are subject to the larger federal government or unitary government.

national security, all these entities and also others similar to them or are likely to come up in the future as geopolitical entities with governable human systems can be considered as “nations” (Box 1.7).

Box 1.7 Does a Nation Need Land?

There is no specific legal requirement for a nation to have land as appreciated in this study. But it needs a system boundary that need not be in the physical terrain. This statement is debatable, though. But, certainly a nation needs people to claim it exclusively. That means people and claim are important conditions for a nation. The entity can be landless but exists as a system by perceptive acceptance. But being landless will deny governance and, therefore, does not come under the study of national security as discussed here. The nation under this pretext has no claim for any terrain since such claim can come only as an extension of land holding. The people of that (landless) nation will be with another nation in whatever characteristics format they are according to the terms of engagement within that nation. A referendum can create nation sans land. But national security governance expects a land-defined nation. The land has to be direct with or without water over it but not exclusively water or any other physical terrain. Nations in exile, under referendum or under similar throwback arrangement, are existable or capable of existing but not governable under national security principles (Zombielands?). Land, the primary terrain, of humans under the land-clasp syndrome⁴¹ with geoproerty rights is a must for national security governance of a human system. Therefore, this argument excludes governance by national security to the entities under referendum, exile, etc. which are landless. Under this argument, claims for such nations can be disputed raising the level or recognition by international communities. This study, being on national security governance, does not recognise a nation in exile in another country, an entity under referendum for a nation, and so on under similar category for national security governance. Such extraneously titled entities are considered part of the nations that facilitate them.

A **nation** in the study of national security is a formal human system that is governable and governed as a collective geopolitical entity. The primary condition in this statement is that a nation should be a recognisable human collective that is governable by a government. It is further explained below.

Considering the varied forms of expression for a particular population group that functions as a formal human system, it is imperative to standardise their existential identity in order to accommodate the concept of national security as a pointer for human system governance. In this melee, it is important to understand that the term

⁴¹Paleri. P. (2014). *Integrated maritime security: governing the ghost protocol*. Vij Books India Pvt. Ltd. p.3.

“national” of the composite term “national security” stands separate from the term nation expressed above. The term “national” applies to all the formal human systems thus mentioned so far and existing as geopolitical entities and also those that are likely to appear in future. For commonality of purpose, the varied systems need to be indexed under a regular frame of existence. The term “geopolitical entities”, in the context of this study, refers to all formal human systems that are governable and identifiable in the geostrategic context as differentially recognised human collectives. The ultimate formal human system stops at a geopolitical entity in the present context with or without a government for the purpose of governance under the concept of national security. Under this standard all the formal human systems of singularity can be called geopolitical entities by invoking the differentiability paradigm which, as mentioned earlier, exists only because of the singularity present in each entity. If so how does one look at the planet of the “formal human systems?” Is it different from the timeline so far, the way it appears today? Yes it is, but it is not, for the purpose of governance where the focus is on people of a nation (Box 1.8) and their well-being.

Box 1.8

So what is “nation” in this study?

A nation is a human collective as a geopolitical entity with geoprimary rights that is governed or governable. This conclusion is basically to avoid anomalies that could be found between geopolitical entities when compared according to their political characteristics. By doing so, the national security principles can be unified for every geopolitical entity.

And what is not a nation under this study though could be a nation under other definitions?

Any entity that is called a nation but cannot be governed under systems prescribed for national governance in this study of the concept national security is not a nation for the purpose of it.

1.6 Geopolitical Entities

In spite of homing on to a term “geopolitical entity” to depict all those formal human systems of existence that are separately governed, there can be issues in identifying them as geopolitical entities in a formal acceptance scenario. The identified geopolitical entity acceptable to one may not be acceptable to another. This kind of diverse opinion is conventional in the study of national security, especially from the point of view of the end objective—well-being of the people of the governable entity. That, in a nutshell, is the purpose of this study.

Here, it is reiterated that “nation” in the composite term “national security” in this study means a geopolitical entity, the ultimate formal human system, barring the

global collective human system. Application of national security paradigm changes the scenario in the global formal system as global security. It is the concern of United Nations and international organisations under the principle of collective governance in the world since the last big war. It can change for better, hopefully without invoking a lengthy world war as a cataclysmic catalyst. But it is not the idea of national security. National security concept stays with nations only.

At this stage, the paramount task is to identify the “geopolitical entities of the world”. It is not difficult. But getting unanimous consent of all other formal systems, rather than geopolitical entities, will be difficult. Each entity will reserve its opinion about another within its geostrategic context. But it is imperative for a study of this nature to understand the governable formal human systems—the geopolitical entities. The condition is that the finding should cover the entire human population with each human as a member of at least one of the geopolitical entities. No individual human should be left behind without an identified entity. It also means it is time functional as humans multiply in capricious progression.

So, how many geopolitical entities are there in the world at a given time? The author, in a study related to the maritime aspects of the land-ocean matrix in 2008, identified 272 geopolitical entities.⁴² They comprised 192 members of the UN, 73 protectorates (then)⁴³ and territories and 7 other entities—State of Vatican City (Holy See), Taiwan or Republic of China (ROC), Kosovo, Western Sahara, West Bank and Gaza Strip, the supranational European Union and Antarctica, the remaining landmass of the good ole’ Pangaea now a global commons (Box 1.9) with certain earmarked territories occupied by a few in the name of research.

Box 1.9 Commons—Global and National

Commons for this study are those resources, in whatever form they are, available for the common survival use of humans and are not the property of any individual human or a group. Among them global commons are what is claimed by the global population, and national commons are those claimed by the people of a geopolitical entity other than the global commons. Commons are the resources that are not owned privately but collectively either globally or nationally.

Subsequent study by the author on maritime affairs in national security showed a shift. The study identified 278 geopolitical entities.⁴⁴ The addition was South Sudan

⁴²Paleri. P. (2009). *Coast guards of the world and emerging maritime threats*. Ocean Policy Research Foundation.

⁴³The term protectorates are not preferred by many as they are considered recognised territories of the claimant nations. The 73 protectorates identified then are now combined in the 58 oceanic territories claimed by the UN members as shown in the succeeding section.

⁴⁴Paleri. P. (2014). *Integrated maritime security: governing the ghost protocol*. Vij Books. p. 413-27.

as an independent country in 2011 and five other entities—Abkhazia, Nagorno-Karabakh, Palestine, Transnistria and Western Ossetia. The study which followed similar principles showed an increase of six entities within a short span of 3 years. Though the period doesn't mean much, it is a visible sign of cookies crumbling randomly. All of them were breakaways or separations (micronisation), not amalgamations or joining up (macronisation).

A reexamination of geopolitical entities for this study (2020) leads to a different conclusion in select areas. The confusion (rather differences in world opinion) regarding human systems is persistent. It is an enduring veracity. Geostrategic approach of nations in this regard should be one of acceptance of the differences in perception. The power of the governments in governance, or rather the authority of governance, will vary when nations are in multiple modes. These factors need to be dovetailed in national governance. This book follows the beaten track, not because of familiarity, as it helps to remain independent and absorb corrections without conflict. In addition, the subject, national security, is studied under universal perception that could be made entity-specific by the respective governments. In other words, governing by national security will have diversified methods for maximising the common objective—well-being of the people—under its universal principles.

1.6.1 Identifying Geopolitical Entities

The considered approach was to identify formal human systems separated by geopolitical parameters that recognise system identity. The formal human systems are land based because sapiens are land-claspers. The following parameters are considered for identifying the geopolitical entities (numbers in brackets as on 2019) exclusive for this study:

- (1) UN member entities
- (2) UN non-member entities
- (3) UN unrecognised entities
- (4) Territories claimed by UN member entities
- (5) Global commons
- (6) Supranational entities

1.6.1.1 UN Member Entities (193)

There are 193 members in the United Nations (2020). The UN was formed at a time when the world was in ruins after an Armageddon—the Second World War. The formation of UN also marks the first move by humans guided by the superior

survival intellect induced by the post-war reflections (author).⁴⁵ The world entities united under the principle of collective security fearing another war of a similar kind.

The United Nations came into existence on 24 October 1945. Representatives of 50 countries met in San Francisco at the United Nations Conference on International Organisation and drew up the United Nations Charter.

There is a tendency to conclude that the member states of the UN are the only countries in the world. It is incorrect. There are other formal human systems in the world.

The membership is based on the qualification as proclaimed in the Charter of the UN which emphasises the conditional expectation that they are peace loving and will remain obliged to the charter and capable of performing according to it. The members accept the obligation. The obvious is that they should be recognised by all or, to be more precise, mutually recognised. This also means a country can choose to be outside the UN even though recognised by all or may not get the membership if all in the team do not recognise it. It is based on this “dilemma of sorts” this study looks at the geopolitical entities of the world for governing towards national security. It includes all in the list. Other entities are taken up in this study as equals from the perspective of national security as they contain human systems that too need to be governed for well-being.

The UN is the only universal organisation to address issues that transcend national borders and cannot be handled by any country acting alone at the moment. Hence the UN or its transformed self is the only potential candidate for global security governance and intervention (GSGI) (Box 1.10). The present stasis of the UN, however, does not complement global security governance except as defined by its charter within limitations.⁴⁶

Box 1.10 What Is GSGI?

GSGI is an acronym for global security governance and intervention in this study. This term is applied to global security maximisation as the world, irrespective of its fragmented format in geopolitical entities, can be governed universally for the well-being of all beyond the present trend of collective (physical) security by applying the principles of national security. In case the UN or its future transcended form of a collective global governance organisation desires to do so, it may need to look at GSGI.

⁴⁵This is notwithstanding the League of Nations that came out of the then existing collective wisdom for dispute clearances subsequent to the First World War on 10 January 1920, primarily for enforcing the Treaty of Versailles and the other peace agreements aimed at “world peace”. It was the first international organisation worldwide. It was found insufficient to handle the global issues and, thereby, dissolved on 20 April 1946, about 6 months after the establishment of the United Nations.

⁴⁶The UN Charter is an interesting document. More on it is given later in this book.

1.6.1.2 UN Non-member Entities (2)

There are other entities that are not members of the UN.

The Holy See, the universal government of the Catholic Church that operates from the Vatican City State, is a sovereign juridical entity under international law and thereby a wholly independent nation. It was established as a result of the Lateran Treaties (1929). Provisions of the treaties were modified by a concordat between the Holy See and Italy in 1984. The landlocked Vatican City (surrounded by Italy) has an area of 0.44 sq km. The population was estimated at 799 (2019).⁴⁷ The country chose not to be a member of the UN. It was given the permanent observer status⁴⁸ in the UN since 6 April 1964.

Another geopolitical entity that has been granted permanent observer status in the UN is the State of Palestine. It is recognised by the majority members of the UN and has an observer status since 29 November 2012. Palestine is a *de jure* sovereign state. The territory that Palestine claims is not under its *de facto* control (2019).

There are certain interesting aspects in the existence of the two non-members of the UN though they are different as geopolitical entities from each other—Holy See and Palestine (Box 1.11).

Box 1.11 Looking beyond UN

The two non-members of the UN, the Holy See and Palestine, reflect an interesting paradigm in the evolution of the human system into polar determinants (not polarisation) based on belief systems that seemingly clash with the concept of sovereignty and national context, the “European model”, originated in 1648. The human segregation (need not be conflict) is visible here. UN does not represent the belief system world but the citizenship world based on the political system of equality and equity (Chap. 2).

1.6.1.3 UN Unrecognised Entities (8)

There are other geopolitical entities in addition to those with UN signature. Among them are six entities that are recognised by one or more members of the UN: Abkhazia, Kosovo, Northern Cyprus, South Ossetia, Taiwan and Western Sahara. The status of two other entities—Nagorno-Karabakh and Transnistria—carried forward from the study in 2012 remains unchanged. Nagorno-Karabakh is also known as Republic of Artsakh or Artsakh. It is *de facto* independent country in Azerbaijan with predominantly Armenian-speaking people. It is a disputed area between Armenia and Azerbaijan. The conflict is territorial as well as ethnic. Recognition process is on. Transnistria is an unrecognised geopolitical entity that

⁴⁷<http://worldpopulationreview.com/countries/vatican-city-population/>. Accessed 29 April 2019.

⁴⁸Status of permanent observer in the UN is based on practice. There is no provision for it in the UN Charter.

splits off from Moldova with an unresolved political status. Many Transnistrians also have Moldovan, Russian or Ukraine citizenships. It is a de facto geopolitical entity with its own government.

1.6.1.4 Territories Claimed by and Accepted by UN Members (58)

There are 58 oceanic territories that are claimed by various UN members as their territories and recognised as such by the international community in general. Fifty-eight such entities are identified in this study. They are distributed in the five ocean divisions, thereby giving credibility to the holding countries as the rim countries of the ocean that holds them. They are (in alphabetical order):

1. American Samoa (USA), a group of islands in the Pacific Ocean.
2. Anguilla (UK), a group of islands in the Atlantic Ocean.
3. Aruba (Netherlands), an autonomous island in the Caribbean Sea.
4. Ashmore and Cartier Islands (Australia) in the Indian Ocean.
5. Bermuda (UK), large and developed group of islands in the Atlantic Ocean.
6. Bouvet Island (Norway), glacier-covered volcanic island in the Atlantic Ocean.
7. British Virgin Islands (UK) in the Caribbean Sea.
8. British Eastern Sovereign Base Area (BESBA) (UK). The area comprises Akrotiri and Dhekelia in the Greek and Turkish Cypriot areas, respectively.
9. British Indian Ocean Territory (BIOT) (UK). The territory comprises the entire Chagos Archipelago of 55 islands in 7 atolls.
10. Cayman Islands (UK) in the Atlantic Ocean.
11. Clipperton Island (France), an atoll in the Pacific Ocean.
12. Cocos (Keeling) Islands (Australia).
13. Christmas Island (Australia) in the Indian Ocean.
14. Cook Islands (New Zealand) in the Pacific Ocean.
15. Coral Sea Islands (Australia) in the Pacific Ocean.
16. Falkland Islands (*Islas Malvinas*) (UK) in the Atlantic Ocean.
17. Faroe Islands (Denmark) in the Atlantic Ocean.
18. French Guiana (France), a coastal area located on the north-eastern coast of South America.
19. French Polynesia (France), archipelagos in the Pacific Ocean.
20. French Southern and Antarctic Lands (*Terres australes et antarctiques françaises*) (TAAF). They comprise Adélie Land, Bassas da India, Europa Island, Glorioso Islands, Ile Amsterdam, Iles Crozet, Iles Eparses, Iles Kerguelen, Ile Saint Paul, Juan de Novo Island and Tromelin Island (France).
21. Gibraltar (UK), a small coastal area on the Strait of Gibraltar.
22. Greenland (Denmark), world's largest island extending from the Atlantic Ocean to the Arctic Ocean.
23. Guadeloupe (France), an archipelago in the Atlantic Ocean.
24. Guam (USA), an island in the Pacific Ocean.
25. Guantánamo Bay (USA), an enclave on the Guantanamo lease from Cuba.

26. Guernsey (UK), an island in the English Channel in the Atlantic Ocean.
27. Heard Island and McDonald Islands (HIMI) (Australia) in the Indian Ocean.
28. Hong Kong (China), a coastal island overlooking the South China Sea.
29. Isle of Man (UK) in the Atlantic Ocean.
30. Jan Mayen (Norway) in the Arctic Ocean.
31. Jersey (UK) in the English Channel in the Atlantic Ocean.
32. Macau (China), a coastal island in the Pacific Ocean.
33. Martinique Island (France) in the Atlantic Ocean.
34. Mayotte Island (France) in the Indian Ocean.
35. Montserrat (UK), an island in the Atlantic Ocean.
36. Navassa Island (USA) in the Atlantic.
37. Netherlands Antilles (Netherlands) in the Atlantic Ocean.
38. New Caledonia (France) in the Pacific Ocean.
39. Niue (New Zealand) in the Pacific Ocean.
40. Norfolk Island (Australia) in the Pacific Ocean.
41. Northern Mariana Islands (USA), a group of islands in the Pacific Ocean.
42. Paracel Islands (controlled by China with claims by Taiwan and Vietnam), a group of about 130 small coral islands in the Pacific.
43. Pitcairn Islands (UK) in the Pacific Ocean.
44. Puerto Rico (USA), an island in the Atlantic Ocean.
45. Reunion (France) island in the Indian Ocean.
46. Saint Barthélemy (France), an island in the Atlantic Ocean.
47. Saint Helena (UK), an island group in the Atlantic Ocean.
48. Saint Martin (France), an island in the Atlantic Ocean.
49. Saint Pierre and Miquelon (France) in the Pacific Ocean.
50. South Georgia and the South Sandwich Islands (UK) in the Atlantic Ocean.
51. Spratly Islands (controlled by China with claims by Malaysia, the Philippines, Taiwan and Vietnam), a group of islands in the Pacific Ocean.
52. Svalbard (Norway) in the Arctic Ocean.
53. Tokelau (New Zealand), a group of atolls in the Pacific Ocean.
54. Turks and Caicos Islands (UK) in the Atlantic Ocean.
55. US Pacific Island Wildlife Refuges (USA) comprising Baker Island, Howland Island, Jarvis Island, Johnston Atoll, Kingman Reef, Midway Islands and Palmyra Atoll, in the Pacific Ocean.
56. Virgin Islands (USA), an archipelago in the Atlantic Ocean.
57. Wake Island (USA), an atoll in the Pacific Ocean.
58. Wallis and Futuna (France), a group of islands in the Pacific.

The 58 territories are under the claims of nine member states of the UN: Australia (6), China (4), Denmark (2), France (13), Netherlands (2), New Zealand (3), Norway (3), the UK (16) and the USA (9).

These territories are “rich” colonial vestiges which carry extreme strategic importance in terms of national security today, especially since the establishment of the United Nations Convention on the Law of the Sea (UNCLOS), even for those who are yet to ratify it. In other words they are the investments of the past for those who own them in perpetuity. Therefore, these far-away-from-home territories are not likely to be conceded by those who possess them. This could also lead to disputes in the future in certain cases along the fault lines of geostrategy.

Some of them are claimed by other nations. Intermittent protests and unrest are common within these territories. These entities are either islands or coastlands.⁴⁹ Some of them are contiguous to their custodians as part of the state but under alternate governance by choice and consensus. Most of the islands were once unknown entities lost among the ocean waves. Some of them were located by pirates or smugglers of the past and were used as hideouts or coves. With the advent of exploration for resources, many of these entities came to be known to the world and became possessions of those who explored them for their resources—guanos (bird drops that are excellent fertilisers), phosphates, salt, etc.—and subsequently colonised and used them for other purposes that ranged from strategic military staging, observation, weapon testing and target practice to possessions of esteem for the kingdoms, royalties and the super rich. Many of the islands were also used for housing convicts away from the mainland, interrogating hardcore criminal suspects and other extremes. Many islands were volcanic. Some of the islands were inhabited by indigenous peoples. Most of them have become extinct now or merged with the settlers losing their indigenous identity in many parts of the world.⁵⁰ Examples are the Manx of the Isle of Man and their Celtic language and the indigenous people of Puerto Rico. Most of these territorial entities were carried forward from the past, some of them centuries before and some as remnants of World War II occupancies subsequently regularised. Some changed hands much later. Still there are war occupancies that are not regularised. They are not specifically listed out in this study. All these entities are geostrategically as well as military strategically vital vantage spots.

1.6.1.5 Global Land Commons (1)

The entire land sans the oceanic global commons on the planet is taken or rather occupied by geopolitical entities within walls and fences, real as well as virtual, under dominion. Some of them are disputed. But there is a small little territory that

⁴⁹ Geopolitical entities with land and maritime borders (with direct access to sea). They are neither landlocked nor islands). Paleri. P. (2014). *Integrated maritime security: governing the ghost protocol*. Vij Books. p.75.

⁵⁰ There are parts in the world where indigenous people are still thriving either in primitive identity or modern. The indigenous islanders of Andaman and Nicobar in India are looked after by the government in their primitive habitats, and agencies protect them. The Government of Japan recognised the indigenous identity of the Ainu population of Hokkaido Prefecture.

was inaccessible for the migrant population in the initial days where the geological forces of spin remain a balancing force limiting the greedy human urges to occupy—Antarctica. It is considered another geopolitical entity for this study for obvious reasons.

1.6.1.6 Supranational Entities (1)

Supranational entities are the overarching land territory acting as an umbrella entity for consensual geopolitical entities. The only geopolitical entity considered for this study is the European Union at the moment. European Union is considered to be an econo-political union of 28 member states (2019). However the principle behind a supranational entity can drift beyond econo-politics to subliminal consensus of people for such security and associate well-being.

This study concludes 263 geopolitical entities as formal human systems, under 6 divisions,⁵¹ either totally or partially recognised by the rest, that qualify for national security governance (2020). However it is not based on worldwide consensus but independent authorship for this study to drive home the principles of national security vis-à-vis human system governance.

Agencies, research institutions, governments, political strategists and so on divide the entities as appropriate to their doctrinal principles and policies. This book takes a different approach. This approach too can change in course of time. The World Factbook of the Central Intelligence Agency (CIA)⁵² records 267 entities under the following categories (2019):

- Independent countries
- Others
- Dependencies and areas of special sovereignty
- Miscellaneous
- Other entities

This study has followed an approach to divide the formal human systems into geopolitical entities, apropos the term nation in the composite term national security that is applicable for researchers and scholars to appreciate human system formalisation over land in the study of national security and governance to maximise national security. One of the choices is to avoid a classified format. There are various alternatives available for studying the world and its human systems. All of them reflect the viewpoints of the scholars behind them. The data with respect to this study therefore is different from the CIA World Factbook and other policy publications.

⁵¹ See 1.6.1.

⁵² **The World Factbook** is a premier annual reference publication of the CIA in the open domain. It provides information on the history, people, government, economy, geography, communications, transportation, military and transnational issues for 267 world entities (2019). They comprise 195 countries and 72 dependencies and other entities including 5 ocean divisions.

The important question is not the differences in various publications and records, but how did all these happen?

1.7 Human Systems: Regressing into Time

Humans and human systems are interesting topics of study. It is a topic in which every human considers a habitual expert. It can be seen exercised even when a baby is born (“She is a copy of her aunt”, “Hey look at her, she recognises you, see she is smiling”, “Honey, the baby just kicked me”, “I could feel...”) to an election campaign when the people vote for the candidates considering them worthy of governing them. Humans do it every day. A neonatal smile could be a sign of relief reflected on its face after successful release of a tiny load of gas from the tummy that only it knows. Well, could be wrong, not being an expert on breaking wind. But something tells babies don’t kick inside a bag of fluid.

The problem seemingly with life is that it is all too simple, hence cannot be easily understood by humans who are not wired or nerved that way. Humans are at the first level of intelligent life forms that can more or less directly “see through time” by reasoning and not by default, to a relatively short period, just sufficient to survive with their “eyes in the brain”. It is called intellect for now, which the author calls human sense.⁵³ It is the human survival tool—not claws, jaws, muscles, toxins and other animal gizmos though humans imitate them using their intellect, perhaps in reverse. A knife replaces a claw as a killer tool identified by the much superior intellect. It is a step down, devolution, if that is the way one likes to go at survival.⁵⁴

Whether an emperor or an impoverished alms seeker, it is the intellect that takes a person to progress into time by making decisions. Using intellect may be expressed in many ways: vision, right brain thinking, seeing the future and so on. That is one of the reasons the term “origin” is avoided in the section title. The origin of human systems is not known in its factuality, perhaps would never be known considering the limitations a sapien have. Simply put, he or she has the entire faculty that is sufficient for survival and existence as demanded by the day—nothing more, nothing less. That is so with everything that breathes life on the planet. There are no reserves or surpluses. No one can perform anything “super”. That is the order of the day in life. Still humans may delve into it in a “complex” manner to understand the “simple” way humans originated. That is how intellect is wired and programmed to develop. The only factuality about human origin is that it had happened in an

⁵³Human sense is a term that the author uses for human intellect when deployed by humans for survival without slipping back in evolution and having to adopt inferior survival tools similar to what other life forms use for survival backwardly modified by human intellect. This is not explained further (also see glossary).

⁵⁴This could also be normal behaviour and a sign of the fore and aft surge in human evolution, mentioned later.

irreversible time period. People are familiar with the way the time period is called for convenience—the past.

Life is subject to scientific research in the pages of history. History, as humans are used to, is what is read backwards in time that has passed. It is a kind of regression. Delving into history is seeing through irreversible time that has gone through. Like an ocean, it is darker as it gets deeper. The problem with history is not that it gets darker as one goes backwards, but increasing chances for accidental and deliberate distortions. This is the curse of history as humans appreciate it. There is another issue here. Is history only about what is called the past? This book differs.

If history means “seeing through time”, as this study may experimentally insist, it could also be through the period that is yet to be recorded, what we call for convenience—the future. It cannot be different, say futury, as time is not a divisible dimension in unitary dimension relative to an activity. Here it is about seeing through time where time is a unitary dimension with respect to human discernment. This brings the argument: history includes history of the past and history of the future for intelligent sapiens that can see into the time. It includes the time passed and yet to pass. Present has no history. It is awareness of the passage of time, whether referential or absolute. That means future too is history, not just seeing through time that has become irreversible. But there is anomaly in past and future when time itself is of questionable appreciation. That is not all. Present is the most indistinguishable aspect in time reference. At the best, one can say that present is the time frame through which the future burns out into the past. More said on it will demand a separate thesis. The simplicity of life makes such regression complex because intellectual blindness blended with ignorance, in part or full, complicates issues.

At the moment the question is what happens in a time progression—about things that are yet to happen. Here again the results will be constrained by human anxiety and prejudice besides, of course, natural ignorance. The survival emotions (Box 1.12) of humans, though vital for survival, or rather that carry survival, play truant with decisions when the dosage increases. The time in regressive cases of study is irreversible—bingo, gone, ran out of gas.⁵⁵ It is dark and deep there. One can only imagine how the original human-shaped biped would have felt unknown to its developing armoury of vision intellect for survival.⁵⁶ It was supposed to be the intellect, however tiny it would have been, not claws, jaws, muscles and all that the upstream life forms possessed and survived before vanishing without questions. The immediate reaction of the human biped would have been to look for someone who looked “alike” and “similar” in form and shape to cuddle for collective security.⁵⁷ Since then collectiveness became the norm. This norm created

⁵⁵This does not mean the time in progressive cases of study can be manipulated or is reversible as it is yet to happen. One doesn’t know about it yet seriously.

⁵⁶Here vision intellect is the visionary part of intellect that makes one see through time. The vision statement of an organisation or a formal human system otherwise becomes just a desire not based on reality under constraints.

⁵⁷This is not true but drives home the fact again that there is not much change in the ways of the human systems. They huddle even today, drenched in sweat, when a goal is scored against the

groups. Groups formed formal human systems transforming with time and branching into exclusive patterns of choice and belief systems as the brain developed and intellect gained more verve to look into time whether backward (upstream) or forward (downstream). Humans know what is going to happen at least in the immediate future through intellect. They can extend the range, if they care. Intellect as a survival weapon can be sharper today than yesterday.

This also means the future generation will be intellectually smarter. Or rather the young is brighter than the old at any given time, which perhaps both are not aware.

Box 1.12 What Are Survival Emotions?

“Survival emotions”, in this study, is a collective term that explains the innate emotions in a human by default that keeps him or her along the survival track. They are generated in the brain without which humans cannot survive in a competitive life scenario. Or rather they cause continuum existence to human life. They include anger, anxiety, fear, envy, jealousy and others. Each one of them is expected to fire the urge to survive competitively. They are normally considered negative though vital for existence. That is an incongruent reality of sapien life.

It is said that life is not originated on Earth.⁵⁸ However, opinions vary. This book accepts the transplant domain that life came external to the planet and hid it until the times were conducive.⁵⁹ This could be evident if one truthfully digs up the past. It will reflect better. This is important to understand humans. It is not elaborated here as the subject of this study doesn't deal with this argument.

Look at the way minerals formed on Earth, including oceans. They are not uniformly distributed. It is understood that they came from elsewhere in the early days. Similarly nothing prevents non-cellular or unicellular life forms to splatter on Earth when it all began as if there was no other way but to bang big. The showers all over the universe were continuous and heavy. To understand whether life is external to the planet, one can think in different ways. One of them is to study the span of life on Earth and compare the time lapse just to inquire into the age of the planet at that

opponent in a football match, celebrating security against the opposing predators. What else the nations look for in United Nations? Isn't it collective security?

⁵⁸Hawking, S. (2018). *Brief answers to big questions*. John Murray. p.74.

⁵⁹There are chances life came to Earth through rocks from deep space probably inside the solar system as the chances for DNA (deoxyribonucleic acid) to arise from chance or random fluctuations are remote. There is a probability that life has come external to it when the solar system was still unstable. The crucial part of the argument is that if life occurred locally on the planet under remote chances, would it have been able to rise to the present level of intelligent life within the time it had? Another interesting issue is that when life was transplanted in whatever form it was (all possibilities point out to viral state) on the planet, the position of the locations would have been different from where the evidence may be dug up today because of the movement of the crust under the centrifugal forces of Earth.

time. That will call for a pack of questions put in different ways. “Was it possible for life to self-create on the planet at that time?” “Was it easy for self-creation or acceptance at that time?” “Was the planet fit to create life by itself then?” Counterfactually it could be seen that if Earth was the only stellar body going round the sun in the same relative location in the multiverse, the chances of life to get its head up on its own would have been bleak. The seeding would have happened previously and germinated much later when the circumstances became conducive, *a la* minerals that are lifeless. There are two reasons for such a nonscientific laid back thinking in this study on governing human systems. One, it is not a matter of serious interest whether life originally formed on the planet or not; second it explains the relevance of elements and terrain dimensions extending beyond the planet space for national security as mentioned in subsequent chapters. It is just a matter of convenience in research. It is easy to accept it. Because, as said in the beginning, life is a simple aspect, it is better not complicate it though the time span goes beyond gigaannums (Ga). So it is fine to assume life as delivered to planet Earth. Not baked in there. Does it make a difference in thinking national security governance? No. But, it may make the decision-makers including the reader to shift their angle of thinking to a how-to-think mode. That is the mode this study prefers.

The mitochondrial dynastic assessment of human systems takes a beating in one study as it clarifies only succession from the mother. But recent findings declare fathers too can contribute the mighty mitochondrial DNAs to the offspring.⁶⁰ This could be an oddity of sorts considering the limited knowledge humans have at this time. Or it can be a warning that humans conclude about the unknown in haste. There are many unanswered questions about everything that humans encounter in their odyssey through life. Contradictions and oddities what the humans identify in life studies as opposing inconsistencies with truth may be absolutely perfect in life’s own make of itself as conformities and regularities of exactness. The contradictions and oddities that humans identify could be very much a necessity to explain life from human perspectives. The very idea of singularity in consonance with differentiability expressed in the beginning of this chapter is an example. But the fact is that each question will have supporting answers as nothing can effect without a cause. Interestingly, the effect from a cause becomes a cause for another effect in quick succession. Miracles simply cannot happen; one has to agree at least to this idea. The causes may not be known in many cases. This doesn’t make anything mysterious. Humans have seen this in course of time. Based on this principle, understanding human progression through the closed dynamic system encounters limitations of all sorts based on ignorance and overlay of survival emotions.

⁶⁰ Azvolinsky, A. (2018). “Fathers can pass mitochondrial DNA to children”. <https://www.the-scientist.com/news-opinion/fathers-can-pass-mitochondrial-dna-to-children-65165>. Accessed 17 May 2019.

According to historian and philosopher Arnold J. Toynbee (1899–1975), the human systems existed in groups from the beginning.⁶¹ This study prefers to see humans as relatively civilised⁶² within the absolute system of unitary civilisation. Many human settlements advanced naturally within the constraints of the period they existed and vanished without trace under unforeseen circumstances. The circumstances, obviously, would have been beyond their control. These settlements were in the form of societies or human collectives, not nations. Historians used societies as the intelligible units of human settlements for their studies according to Toynbee. The ancestors of the people of today's nations belonged to these societies, the reasoned units of historical study.

Civilisation, for some, means a materially advanced human society.⁶³ Another way to look at the term is as the total product of human creativity and intellect at any given time. That could vary even within a society depending upon its size and the barriers within. The motive is by default. It is not just an urge to improve on nature and its unyielding environment but to use the intellect to do that. As intellect splurges ahead, there is also destruction, of lives and environment, in its uncontrolled form. Such advancements may climax with self-destruction. Intelligence has an inbuilt affinity for self-destruction that often the humans take too lightly. The psychology of invention perhaps may relate to this phenomenon of balancing destruction. How do humans dispose garbage? Isn't it by destruction of the original? Isn't intelligent invention on display here?

Accentuating the principle of a single civilisation (unitary civilisation instead of multiple civilisations) is the idea the author favoured in national security studies all along. It helps to explain the sapien chain of progression in a better way. The adopted civilisation model in this case is a long "worm tunnel" that envelops the entire human system with graduating sections of development the world witnesses at any one time—a "train" with differently graded, but connected, compartments in which the only choice is to move forward not alight sideways. In short, the compartments

⁶¹ Toynbee, A.J. (1978). *A study of history, Vol. 1*. Dell Publishing Co., Inc. p. 648. Toynbee also mentions that social systems were there much before humans evolved. The animal kingdom found it convenient to live together in social systems that induced higher levels of security. Once evolved, humans too decided to live that way.

⁶² "Civilised" means the ability to use the intellect for collective survival in responsibly humane or sapien manner.

⁶³ There are historians and writers of history who say that the word civilisation is used to depict many things. There are words like "uncivilised" to explain about societies that are considered inferior, normally by people who consider themselves as civilised. For this study, civilisation is taken as the process of growth by creative intellectual development towards increased comfort and the fact that, in a formal society, people may be at different levels of such advancement. The entire society, therefore, had to be seen as a civilisation with a lower and upper limit. This study propounds that principle sans a partisan attitude. Another aspect this book does not subscribe is to see the human system of a period the world over, especially under today's conditions of nation states, as different civilisations, but as people at different stages of development within a civilisation. Such understanding and perception, though may seem selective, is important for the study of national security.

lap dissolve into each other to form an unbridled and continuous tube train of sorts (Box 1.13). Under such perception, it can be visualised that in any age of “historically recognised” multiple civilisations, the world also had less civilised societies within them. It may be considered an imbalance (built in contradiction like ghettos in a natural metro), but actually it is not. It is the way human society creeps towards progress between two different ends—the head and the tail on either end of a long middle section. The worm train moves relative to time and, within it, the people moving ahead of one leaving him or her behind in intellectual affluence of reasoning. The question is “What if an element or a section of the ‘worm train’ remains static or destroyed?” Static or arrested societies (Toynbee, 1934)⁶⁴ can be seen at different sections especially at the end of the train, but they also have motion forward, though relatively less than certain other sections that may go past if not at the end of it. Even at the end, there is motion forward if there is no destruction by extinction. Yet, if the sections remain static, the worm train of civilisation has the capacity to stretch. It continues to crawl forward in history by regeneration if destroyed at sections or compartments. The train of civilisation grows like the amputated tail of a lizard. Humans have repeatedly shown that they are determined to stay against all odds. Succumbing to the odds is also a part of this survival technique. They are designed that way. The worm design is perhaps the secret by which they achieve this feat. If the human systems developed uniformly and concurrently, the shape of the worm would have changed into that of a globule. In such a state, the humans as a whole would be most vulnerable. If perished, there might not be another opportunity. It would be like the destruction of a crop in a field where every plant is at uniform development. Life survives if it is in different stages of development. This is a find in national security studies (author) that needs further research.

Historically, the idea of civilisations was different. To shift into a more systematic and reader-friendly presentation of the case, it can be iterated that in a historically recognised civilisations, there were “less civilised” societies also.⁶⁵ They were called primitive societies in some cases though it is not an acceptable terminology in this study except for offering an explanation. “How primitive is primitive?” is a question. It cannot be defined to a consensus. Relatively civilised societies existed within a human civilisation all the time. The only difference today is that they exist within the boundaries of a geointentity, now, a nation and not in a society of disjointed settlements. Study of societies at various stages of development also shows that they were different from each other and from the lesser advanced societies that existed during the period. There were other differences too. The asymmetries of lifestyles within civilisations continue today. The civilisations were also not identical in their growth,

⁶⁴Toynbee mentioned arrested civilisations. Toynbee, A.J., (1978). *A study of history. Vol.1*. Oxford University Press. Toynbee mentions different sectorial civilisations. This book doesn’t challenge multiple civilisations.

⁶⁵The words uncivilised, barbaric, savage, pagans, boorish, etc., though often used in writing, are not repeated in this book because they depict the relative nature of the community through the eyes of those who call them that way. This study considers they are derogatory by intention and not based on the sapient sense of mutual respect even in adversarial conditions.

character and existence, though certain common characteristic traits may seem similar.

National security studies have to see people as whole, not as different groups but a single civilisation with people at different stages of development. This study is not on civilisation, and it does not intend to challenge the theories of experts on the subject. But it perceives civilisation as a whole unit with respect to time. It makes the passage to identify the concept of national security easy and practical. It is important for this study.

Unlike in multiple civilisations, the unitary civilisation (Box 1.13) neither gets arrested nor vanishes into time. This also approves the macro-appreciation of human system development as a unitary civilisation in the worm tunnel paradigm.

An appraisal of the multiple civilisation theories and unitary civilisation argument may indicate different perspectives of societal systems:

- Civilisations as the scholarly historians depicted were based on socioeconomic development of human systems and subsequent urbanisation of society.
- They were not based on individual or group intellectual development in the use of intellectual prowess in making life collectively better towards consensual well-being of all.
- A unitary civilisation of the global human system if envisaged will lead to a stasis where the entire human system positioned in a progressive worm train of intellectual development through reasoning at any given time with forward movements of people as if on a pedestrian way in rush hour with one overtaking another and another falling back simultaneously in a linear mode of a vectorial paradigm. The peculiarity of such movement is that nobody is blocking another as if on a track lane.
- The unitary civilisation theory does not segregate people. The whole world is taken as a single civilisation under different individual and system development and survival application.
- Every human is considered a member of the unitary civilisation.
- There is a built-in urge to progressively develop in human beings.
- It comprises primal as well as relatively well-developed human systems that will continue at any given time in the world.
- Since it all began, societies remained in clusters of affinity with each cluster divided by the affinity induced separation.
- The more developed societies branched out from the less developed whether economical or intellectual.
- The less civilised followed and established link with more civilised in symbiotic socioeconomic and to some extent in knowledge relations.
- Still, each of these societies is to be considered as part of a larger society, all “moving” ahead in evolution as part of history of the future. This formulates a new concept as a law: “humans can neither get arrested nor fall back in civilisation. They can only move ahead in development”.
- Some of the human systems were “aborted” under the strain of development.

- The most developed human systems of the period at various parts of the world came to be called civilisations by historians. They became emphatically distinct from the so-called “less civilised” societies. The class difference was clear and visible.
- Some of the civilised societies were restrictive in nature and thereby got period-saturated.
- The unrestrictive civilised systems declined along with primitive societies that could not sustain themselves, giving way to newer systems.
- Both the systems exist today in different forms of class, not as universal societies, but as nation states. Nations still behave as part of societies by coalition and other means.
- Both the systems survived as long as their governance could survive the challenges, some of them used coping behaviour and survived longer. Examples are that of restrictive civilisations.
- Some of the civilisations were affiliated to another. This shows that not all civilisations were mutually exclusive. They either grew from the roots or branched out to shape another.
- Civilisations vanished from the face of the earth when they succumbed to mainly natural forces beyond their control. There are yet examples of self-destructive civilisations or human systems.⁶⁶
- Civilisations continued to spring up even after they vanished from the world at different times. These were influenced by the previous civilisations by fusion.⁶⁷
- Some of them had neither a predecessor nor a successor. An example quoted by Toynbee is the Egyptiac society.⁶⁸
- Under conditions of today when the world itself is one big global enterprise, it is more appropriate to see it as a single civilisation with human societies formal as nation states, with formal and informal groups external or internal to them.
- Under such conditions, people move towards a global ideal though under tight conditions of impracticality.
- Under the universal viewpoint of a single civilisation, there cannot be clashes between civilisations. There can be clashes between different human systems governed by different ideologies within a civilisation.

⁶⁶ God’s punishment is usually the accepted rationalisation when unforeseen forces destroy a civilisation, whereas self-destructive civilisation is the one in which the human subjects tend to induce destruction by unparalleled acts of foolhardy behaviour. An example often quoted is a nuclear holocaust. The author does not believe that in a society that will ever be ruled by primordial fear, a direct human-induced holocaust that will wipe out the entire human system is ever a possibility. But unwise activities and bad governance may bring indirect inducements to disaster situations. This is a hypothesis.

⁶⁷ Toynbee, A.J. (1978). *A study of history, Vol. 1*. Dell Publishing Co., Inc. pp. 642 and 649.

⁶⁸ Ibid., p. 642.

- Once extended further, under the principle of a single civilised global human system, all the clashes that the world witnesses today are not clashes between civilisations but within a giant civilisation, like turbulence in a thundercloud⁶⁹ — the levels do not matter.

All these can be taken as independent hypotheses for study. But in the study of national security, it will be advisable to consider the theory of unitary civilisation to govern the nations under the global scenario and especially when the global human system is yet to become an acceptable system for governance.

More than the clashes within a civilisation, the clashes within an individual human being are more severe and complex in the study of national security. Often such clashes lead to major changes in global politics depending upon the individual's status and authority in the society. From the first human, who was capable of using the intellectual thought process to decide the next step, it was the brain that always came to the rescue churning out ideas for survival. For human beings, the brain became more important than their feeble physique. The physique was a tool to use tools. Anthropologists, historians, psychologists and physiologists all wrote dissimilarly about humans on similar things. It was the brain that warned, "Unite, lest you should perish". But the individual perceptions told them, "Be selfish, lest you should suffer". The limbic, neo-cortex and reptilian brains (and many unknown phantom formats that are yet to be identified) in a human neurological system constantly clashed with each other to come to a conclusion on what to do. The clashes within the human mindscapes act as influential agents of change in a human system.⁷⁰ This is just an example of how the flashes in a single mind can impact human lives. There were many situations when clashes within the mind of a single human surfaced with chilling consequences in the human systems around. The terrifying guilt that soon follows the fiery action is controlled by the ultimate dowsing of the culpable mind—rationalisation of the deed. Here, right and wrong of the action is irrelevant, because it is relative to the perceiver.

Box 1.13 Unitary Civilisation, Worm Tunnel and Worm Train

It is important to perceive these three terms used in this book to appreciate the human system dynamics in time. These are perceptions used to emphasise the human system dynamics by evolution in the passage of time for appreciating national governance for human well-being. Prospecting human governance is

(continued)

⁶⁹The popular cumulonimbus cloud (C_b) that the airplane pilots circumvent to avoid the turbulence. It has a base and a head that constantly change with heavy turbulence and draft within. Here a civilisation is seen as something like a C_b cloud.

⁷⁰An example is the simple move to stage, what the media called a royal coup by King Gyanendra of Nepal on 1 February 2005 by sacking the democratically elected government of Nepal and declaring an emergency and opening up his own council of ministers in utter disregard to democratic constitution. The world knew about the change only when it happened.

Box 1.13 (continued)

central to the concept of national security. For this purpose, this study considers human system as a unitary civilisation where individual humans and their systems relatively advance in time within a close-ended worm tunnel unlike the open-ended cosmic worm tunnel that serves as a passage. The worm tunnel of the unitary civilisation being close ended also moves with them as a worm train. The only direction is forward and that is why the tunnel concept is invoked. The humans in the system are appositionally displaced from each other in different intellectual stasis of awareness in respect of time that also reflects as a resultant in their systems. The displacement lanes for individuals as well as the groups do not overlap but provide absolute freedom for one individual or group to move ahead or fall behind another in time stasis. For a better appreciation, one can imagine a physical running track with individual running lanes with freedom of overtaking or falling back in the physical dimension though they are not at all similar. No such comparison is possible. The three terms have to be perceived within the time spatial.

To reiterate, every individual is free to advance in life without external hindrance along the individual lane leading through a closed end worm tunnel that is moving with the human system. It has to be seen as a total global human system for the purpose and not segregated nationally.

In the overall perception, it means the human system of unitary civilisation is enveloped by a worm tunnel providing a boundary limitation which unlike a cosmological worm tunnel has no exit or entry points and does not connect to any other dimension. The worm tunnel envelops the humans from the individual beginning within like a pod with boundaries and moves with the individual human as long as existence demands.

All the incidents in the human system happen within the unitary civilisation for modelling the study of human well-being whether global or national. For a particular nation, this study is linked with the concept of national security.

1.8 Invariance of Human System

Nothing changes in a human system; or that is how it seems. There seems to be a law of sorts that defines this invariance. This means the future is visible in the past in a human system.⁷¹

⁷¹This statement is a leading pointer to the law of invariance this section intends to examine. Appreciating the law of invariance is essential to analyse the concept of national security or the security concept of human systems today. It also explains the fact that bringing the people towards maximum well-being is much easier under the law of invariance since the future can be seen in the past for a close observer. If not the study of national security and thereby governance has to take a

Humans, at the apex of the living systems, persisted and multiplied unlike many other species that vanished from Earth (temporarily or otherwise). There are recorded historical statements on how life survived through hell and high water, some of them its own making. Distortions in recordings of human survival are natural under various limitations. They could be accidental, mistaken or deliberate based on the vicissitudes of those who document them. The depth of the period and clarity of vision are increasing constantly. It is natural. In spite of various limitations, humans are vested with capabilities that are greater than ever. A fraction of these capabilities is sufficient to create a world worth living, where the *raison d'être*, purpose or *ikigai* for living is life itself. Humans can create a world that can dwarf More's fictional Utopia—the perfect world⁷²—provided they are willing.

Here comes the contradiction. Humans may think they can, but they cannot make a Utopia or even come close to that if past is of any evidence. Why can't they? Because that was the way it has been. And that is how Utopia, the perfect human system, will be—a fantasy destination. Perhaps survival can be at stake in a Utopian society. People have been living together for ages as human systems. There was never such an effort, except in loquacious human verbosity, to make the world a better place to live for all. Human urge for better is always limited by the push for more for the self. This paradigm will be examined later and is a key point in governance that the governors as well as the governed should know. Though the consensus for Utopian life came from all at different periods, the attempts on the ground were seemingly constrained as if it ain't a possible dream.

A closer look will reveal that the world today is in no way different from the world yesterday in its outlook, dynamics and behaviour. The so-called changes are in appearance, aging, thinking process, capabilities, etc., among other superficialities. Does the unchangeability of human stasis make the human systems unique? No, it equates the system with other forms of life as life is, though the species is unique in its own format. That holds the key that human system cannot change but can only transform like any other life forms since life is a unitary paradigm. One life form can be different from another, but life, as it is, is identical in every life form. The pattern and existential format of life forms are identical. There is nothing surprising here. Life is one and similar to all life forms, but a life form is different from another relative to its life.

This also means, in today's world, the core oddities are the same as those that were there yesterday. Therefore they have to be the same tomorrow also as the time span is unimaginably short even for a million and more years for a life form to change its existential format and thereby the stasis. It explains the contradictions and oddity theory. The character of civilisations as thought previously may have changed a bit by a dash of civility upgradation. But a Buddha, Nero or Gandhi may not find the world different on a revisit. Of course, they may be in awe with the

different turn. In the reverse it also proves the existence of the law of invariance as governance of the human system is still an ongoing process, an extension of the practices in the past.

⁷²A socio-political satire by author Thomas More (1478–1535).

transformation of the system they left. Nations will compete to woo and please them depending upon their political and market values. The majority among people find their lives as difficult as the way their ancestors felt. There is no sign of it going to be otherwise in future. In spite of the continuing oddities within the unchangeableness, the world is fine, and all is well in a system that is filled with peculiarities of unknown kinds. Within this invariance many things happen in a human system with remarkable regularity irrespective of the period setup. Here it is important to understand unchangeableness is not immutability in its real sense.

There are trillions of life forms on earth. Can there be a different rule for humans? It is not possible. All the other life forms exhibit the law of invariance. So, what are the humans talking about change? Simple, the humans get surprised when they find their intellect creates superficial alterations.

Is there something special about all these? Freaky bifurcations seem to be natural to human life. And the world goes on as before only to repeat the oddities proving the existence of invariance in the human system (too) that can throw light on the shape of things to come and thereby ways of managing them. Humans have witnessed life in every possible shade and its repetition through time but never understood them seriously. From a different perception, the bifurcations in human life may not be freaky or odd. They could be natural to life heavily imbibed in the survival principle by design. “Survive against all odds” is the call. The freakiness lies in their relative perception. The world has changed externally, but the human behaviour and biological designs seemingly have not. Probably the changes may never be seen in a long time. Human emotions and feelings are the same. They still jump at the sight of a rope coiled on the sidewalk of a modern-day city mistaking it for a viper.⁷³ Blood rushes to the feet to make it jump; the face goes pale—the primitive instinct for survival. Emotions remain the same as it was in the beginning. If there is change (why if? It is there), it is infinitesimally small compared to the span of human existence. The rate of change is not easily perceivable. The changes that one visualises are in the indicators of development, affluence, prosperity, environment, etc. Such changes can alternate both ways by waning or waxing. There are many examples.

But still, humans today are as they were before when they first started moving around the planet. This is the law of invariance, perhaps the most critical to decision-making in governance under a national security regime. Reliance on precedence in decision-making is one of the evidences.

The law of invariance can be defined as *the changes in the core behaviour of a human system, while a reality, is too negligible to notice and, therefore, for a psycho-somatic system application relative to humans, it is sufficient to presume*

⁷³In the ancient Indian scripture *Brahma Sutras* (estimated as composed between 500 and 200 BCE), this perception is called *adhyasa* (Sanskrit), a roughly translated superimposition. There is neither snake nor the rope in reality because from ultimate standpoint the duality is a mere mirage created out of consciousness.

*the model applicable today would be constant in time whether it is past or future.*⁷⁴

Under the law of invariance, what an individual human or human system experiences will be more or less similar to what others before had faced and experienced. Only the props will be different. The law therefore has to be obvious for the future too.

The law of invariance is close to what Marcus Aurelius Antoninus Augustus (121–180 CE), the philosophic emperor of Rome who ruled during 161–180 CE, has written as the uniformity of nature. He was a good emperor who governed well and a stoic philosopher of the period. He stated that in the light of the uniformity of nature, a man of 40 with moderate intelligence had seen the entire past and future.⁷⁵ In other words, future is a repeat. It could also be noted that in the age of Marcus, forty years was a good sign of longevity. Today people live longer and witness the same repeatedly. And so were their ancestors in the near past and will be those who succeed them in the near future. Life doesn't suck; it could be worse (sans governance). Hail good ole' Marcus!

But the interesting aspect is that, in spite of this drudgery, no one wants to go. That does not come as a surprise. Fear of death itself is mortal! It doesn't matter if life is plain duplication within the law of invariance. At the same time, everybody wants comfort and looks upon the government for well-being.

1.9 Centroid and Human System

Survival of a system or its sustainable existence depends upon various factors exclusive to it as a function of time. Every system has its “critical” centre where it will be the strongest as well as most vulnerable, the way one sees it. This statement is also an explanation that highlights the concept of contradiction as an essential ingredient in intelligent sapien system. It is mentioned earlier. The critical centre is decisive for sustainable being of the system. Leveraging on this critical “centre” (or centrum) can make the system sustainable. Striking the centrum can destroy the system.

In mathematics and physical sciences, this point is the “centre of mass” or the more familiar “centre of gravity”. These terms are replaced in modern times with the term “centroid”, though there can be differences in usage. For example, a search area at sea for something that is missing or hiding can begin from the “centrum” for the navy or coast guard. In such case the centrum is the centroid of the operation. The centrum can shift if the search is not successful. And so is the centroid, under its own governing forces.

A centroid by mathematical definition is the “centre of mass” of a two-dimensional figure or three-dimensional solid. The definition extends to any

⁷⁴This definition can be further researched and modified.

⁷⁵Toynbee, A.J. (1978). *A study of history*, Vol. 2. Dell Publishing Co., Inc., p. 19.

object in n-dimensional space. The centroid of a triangle is the point where all the three medians intersect. A sphere will have its centroid at the centre. Every geometrical shape will have a centroid. The formula for centroid will change with the geometry of shape and distribution of mass. This technique is very much applicable in social sciences also. The laws are different, though.

The centroid is considered the mean position of all the points in all of the coordinate directions. If the object is of uniform density, its mass is centred on its centroid. But what is mass? It is not weight. Mass is the amount of matter in it. It is constant. When pulled by gravity, mass becomes weight. Rather mass is weight sans gravity affiliation. Gravity is one of the four fundamental forces of nature. Mass resists acceleration. So to make it move, one has to exert force. Weight of an object being depended on gravity keeps changing from place to place. Mass is linked to energy by the famous equation: $E=MC^2$. It is called mass-energy equivalence. Then it goes on to explain energy is mass and to space that is created when mass is “cooked” from energy. Just like the moat around the castle the kids make on the beach. Moat around the beach castle is the space that got made automatically when the sand is pitched to make the castle. For a cosmologist, the moat is the space and the castles are the bodies of the universe—the celestials.⁷⁶ What has it got to do with the centroid theory of human systems? Nothing special, but it can provide a window side view to ponder on similarities.

If physics, the first subject born with the universe, applies to all the forces and energies it is subjected to, can human system and their deeds for survival be out of it? One knows the direct influence of the other two (chemistry and biology) in life (Box 1.14). This is one of the questions that could be pondered by all who deals with human systems in infinite shades. So, where does it come in this study? It can be examined in a limited sense between the two covers of this book as a passing reference for further study in human system governance.

Box 1.14 The Triad of Science—Physics, Chemistry and Biology

Physics is the mother of all subjects. It is the oldest knowledge window of the scientific triad that started with the “Big Bang”. Physics came first and then the other two—chemistry and biology. They came up sequentially. Biology (science of life) is the youngest of the triad or the one that completed the triad of science. All other sciences are hybrid part of one of the three—all combined. There are many. More may come. It is amazing that every human has essential knowledge of the triad since the beginning. Humans picked them up with their intellectual antenna almost the same time. Of course, that was much later when humans became humans. The triad was already there. The hint here is about their influence in governance.

⁷⁶The term celestials for this study means celestial bodies of all kinds as matter.

Further, in science, the centroid concept changes to various other formats. In astronomy, the term “barycentre” is used to explain the centre of mass of two or more bodies that orbit one another. Barycentre is the point about which the bodies orbit one another. It keeps shifting based on how massive the bodies are and the relative distance between them. Does it happen with human systems in an interactive mode? Does geolocation of a country matter in its relation with itself and another? If so what makes it matter? Can it be brought under the concept of the centroid of human systems? Or can it be said that the centre of gravity of a human system lies at its centroid? In the last statement, centroid is not centre of gravity but much bigger—where the centre of gravity of the system resides.

In geostrategy there is a saying that “your enemy’s enemy is your friend”. It is attributed to Kautilya who wrote the ancient treatise *Arthashastra*.⁷⁷ Was it based on the centroid principle as appreciated in those days?

Can there be a centroid in a human system and, if so, can it be appropriated in the studies of national security governance? Whatever, it is for the governments to establish relative to their mode of governance.

It also means that the centroids a government establishes for its national security governance can be different from what another government foresees within the same system. And the best in establishing the centroid may control the chance of winning. How does a government assess the centroid for governance? Is it based on the power polarity of human systems? If so what creates polarities? It is within this paradigm one has to search for the centroid and decide on governance closer to the identified centroid. There cannot be a common centroid for all nations in this case. But there can be one for the world—the global human system, especially from the alien perspective.

Military strategy mentions centre of gravity (COG). To hit the enemy force at its centre of gravity is the objective to win. COG facilitates the employment of forces in both attrition and annihilation (psychological) military strategy to defeat the enemy’s armed forces, networks and organisations and prevents the enemy from achieving their military objectives. This is an adversarial objective. In national security it could turn out to be supportive strategy.

Demographic shifts, intellectual apprising and associated fluxes toss and shift the centroid in national security (C_{ns}). It is moving all the time.⁷⁸ In the process, the overall national security too shifts and gets tossed around. It could also be fragmented for each element. In mathematics, finding centroid of a polyshape is a

⁷⁷The *Arthashastra* is an ancient Indian treatise on statecraft, economic policy and [military strategy](#) in Sanskrit. It is timed between the second and third centuries BCE. The treatise is attributed to Kautilya (identified as Vishnu Gupta and Chanakya) as the author. Some authors believe it is the work of several authors over centuries. The *Arthashastra* was influential in ancient India until the twelfth century.

⁷⁸For example, the plan for government of India to grant citizenship to people who were persecuted elsewhere under minority shackles by through a Citizenship (Amendment) Bill (CAB) (2019) once executed can shift the centroid of the human systems in India. The shift needs to be assessed counterfactually (before it happens) to appreciate the impact on national security.

problem. A polyshape has vertices, edges, faces, curves, holes and others. National security studies transcend pure maths making it more complex. This complexity could be one of the causes of failures in governance. Identifying the centroid and its movements could resolve some of the issues. Logically finding the centroid of national security in the global parlance need not be a problem but assimilating it with respect to a particular nation and thereafter plotting its movement have to be taken up sincerely relative to one's nation as the primary human system. This comes in the study of geostrategic security, the eighth element of national security (Chap. 6).

Many variables act on the centroid of human system and thereby change its relative position. They can be situational as well as standard. Migration and demographic density are included in the standard forces. Governments and policy decisions can be included among the situational forces. Shifting centroids make the governments perform differently. No government is alike the other in a dynamic world. Shifting centroid is one of the reasons. Don't blame it on the politicians or compare between them without giving allowance and adjusting the findings for the shifting centroid. There are more reasons.

Perhaps, the most prominently discussed centroid is that of global economy. It is mentioned as the world's centre of economic gravity (CEG). Serious studies have gone into this topic. The studies focused on global economy's centre of gravity—the average location of the planet's economic activity measured by the gross domestic product (GDP) generated across identifiable locations on the Earth's surface. According to one such calculation that took into account the entirety of GDP produced on this planet, the world's economic centre of gravity had moved in 2008 close to Izmir (Turkey), pulled eastward across the surface of the Earth and was forecasts to continue to shift further eastward and lie between India and China.⁷⁹ But is GDP that important?

The centroid of human system on the surface of the planet will be a part of national security governance. In such case it may be necessary to identify the shift in each of the 16 elements of national security (Chap. 6) with reference to the 8 terrains (Chap. 5) and extrapolating them specific to a nation's national security governance perspective. Here comes an interesting question: can the centroid of the global human system fall outside the Earth? Yes, ideally one day when it becomes part of a human system of multiple planets or celestials or when nations are controlled from space. . .if humans ever reach to that extent. It is not the time to worry about it now.

⁷⁹Quah, D. (2011). "The global economy's shifting centre of gravity" in *Global policy*. 2(1):3-9. January 2011. https://www.researchgate.net/publication/227561687_The_Global_Economy's_Shifting_Centre_of_Gravity. Accessed 13 November 2019.

1.10 Summation

This chapter had a brief look at humans and human systems in the quest for human well-being through national governance. It is a controversial topic because people perceive life differently. They frame own opinion. That is very much acceptable. That is what humans are as individuals and in groups. The opinion in this book too is an example of this variance. Within this variation the efforts are to strike a balance in relation to the idea of national security that this book advocates—the overall well-being of people of a geopolitical entity under governance. This is being examined further.

There are many limitations to an activity under the human survival paradigm. The limitation theory will be examined later. The limitations of nature are countered by the law of invariance to some extent. Or perhaps the limitations induce the law of invariance. The relationship between them is not yet understood. But such understanding is not necessary for governance. Under the theory of invariance, what suited in the past may also go with the future without much of a change. It is not necessary for a government to work on the invariance to change it. It is sufficient to understand the goal and premising actions. Timely modifications are sufficient for bettering human life. It is a built in aspect in human systems. There is a kind of self-cleansing and correcting by default. It is visible in the environment. That is why life cannot be extinguished by life forms by their action. They can only turn it topsy-turvy imprudently. In addition, this chapter exemplifies the singularity and differentiability phenomenon of humans and human systems—the basic characteristics. This shows the protean personalities of people in relation to situations in life. The singularity-cum-differentiability behaviour of people with protean assimilation can be very challenging in governance of any formal human system ranging from the smallest (a family) to the highest (a geopolitical entity). A person today may behave differently tomorrow.

In national security governance, every activity is centred on people as individuals and in groups. The group is more critical to governance than individuals. So a human system for national security governance has to be seen as a conglomeration of blocks comprising groups rather than individuals. These groups will have a centroid which will be shifting in course of time. The centroid could be taken as the point on which governance will be focused and moving as it shifts its position in relation to the group administered for national security. National security as depicted in this book is the result of exploration of an idea, taking cognizance to the law of invariance and law of limitations in the system. The proof of existence of the law of invariance lies within the repetitiveness of human activities beyond the barrier of time. Under such conditions, finding a solution to human miseries is comparatively easy if the situation is analysed within the framework of a nation, fixing accountability to those responsible for its governance. National security is such a concept that can be used to explore the ideal state characteristics from human perspective and make it real by pragmatic governance. Today, national security is ubiquitously discussed in forums on national interests. It is not a new concept that sprang up abruptly in

geopolitical expression like many catchphrases floating without serious meanings today. National security is not a hollow terminology but a dense and heavy conceptual idea that could be the goal and interventional track for national governance. The evolution of the concept and its elements were seemingly gradual.⁸⁰ Therefore, it can be defined and its elements identified at any point in time within the changing scenario. It can be further modelled in a terrain-specific outfit.

Human beings seemingly are the end points of evolution at the present time frame, though one can hardly call them perfect. This doesn't mean they will all die one day. It only means if there has to be someone above human species, it has to be humans themselves. There cannot be another survival tool than human intelligence (further developed). Humans are highly vulnerable. Vulnerability of life form is an existential limit for continuity. What is not understood in years of human life is how to get to the bottom of the issue of security. Is it a passive approach or an active offensive at the core issues? Or is it both? The problems continue today the same way they were before, leading one to conclude that there are many invariances in the human system that prevent it from further advancement in a linear mode. The advancements are seemingly cyclic from order to disorder and again back to order with the entire cycle moving ahead or rather advancing forward on a base track in an expanding format. If that is so, it should be easy to govern to maximise the well-being of people. Providing security to people needs serious planning. Security measures are not just observables but planned governance by advanced methods of information gathering and processing. There are problems, though. They won't simply go away.

The world does not change. It is the same today. The gladiators have become professional sports personnel; dancers and court jesters are today's movie stars and show personnel; shadow plays became the movies; and the kings are getting transmuted to elected representatives. It is the same, almost. They can be called minor alterations within the unchangeable. It is a kind of social topology. Under the law of invariance, everything remains the same—the properties are preserved topologically. Altered life forms and their behaviour reflect the original (was there one?). In human life people are the same—soldiers, pirates, traders, killers, robbers, thieves, prostitutes, entertainers, teachers, priests, ministers and others—all in variations of life's assignments within invariance. The law of invariance prevails. The invariance is a good sign because that makes the job of a government to provide for the well-being of its people less complicated.

⁸⁰“Homeland Security” is another terminology used when the US President Bush Jr. set up a new organisation to look into security in the wake of attacks on the World Trade Center and the Pentagon by Islamic suicide squads on 11 September 2001. “Homeland” refers to the USA itself. One of the nine tenets overviewed by RAND in its Project AIR FORCE (1996) for 25 years assessment was “the US *homeland* will be more exposed to attack” (Zalmay Khalilzad and Ian O. Lesser, *Sources of Conflict in the 21st Century* (Dehradun: Natraj Publishers, 1998), p. 7). However there is no indication that in course of time the concept of national security will be replaced by “homeland security”. It is relatively smaller and limited in elements. Homeland security is more about physical security of homeland.

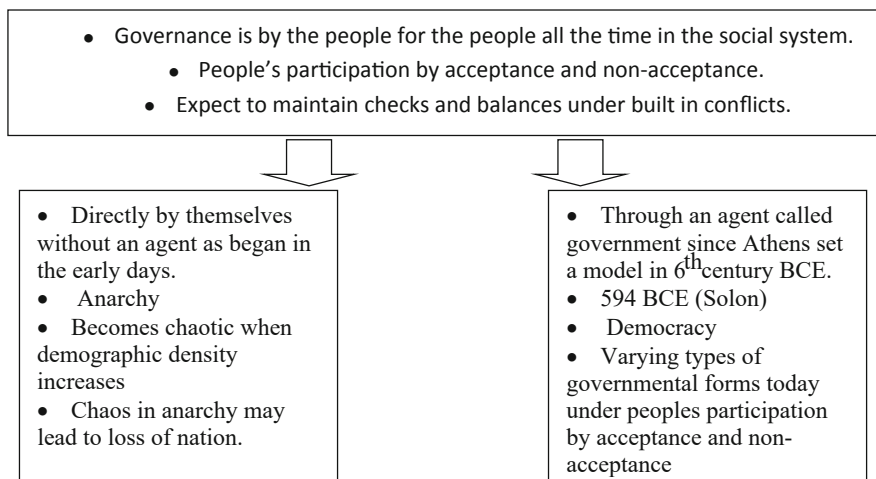

Fig. 1.1 The paradox of human governance under the law of invariance before and after Athenian democracy (Democracy dated since Solon's efforts in archaic Athens to bring order to governance through government. Athenian democracy. https://en.wikipedia.org/wiki/Athenian_democracy. Accessed 24 August 2019.)

Human survival is not dependent on national security governance. But well-being is. Humans have overcome every limitation and survived under extreme situations in the course of life. In the survival saga, humans are not alone; every life form is involved. That is the power of life on the planet barring some exceptions. The deluge of harshness in a human system can be swapped for the beauty of challenge it offers to governance. Maximising national security within this deluge is for the benefit of generations yet to come. Those who tread the path are bound to meet with opposing interests.

The researchers need to be clear about governance for prospecting well-being through it. The underlying conjecture is that human governance is not an obligation or responsibility that is newly propped up. It has been there since the human systems felt it was necessary. It happened as they felt they were made for living together with all the differences they carried within the singularity with clashes and all. The system decided to rule themselves directly in the anarchic manner with as much order as possible in the early days that slowly transformed to the agency system with authority delegated by people. The authority acted as the agent called the government that had the consent of people by acceptance or non-acceptance.

In anarchy the agent is absent and the people take on governing themselves by themselves. The democratic format has every other types of governments since the early days including the format called "democracy" during the present times (Fig. 1.1). This is for the convenience of examining national security concept under a revisit.

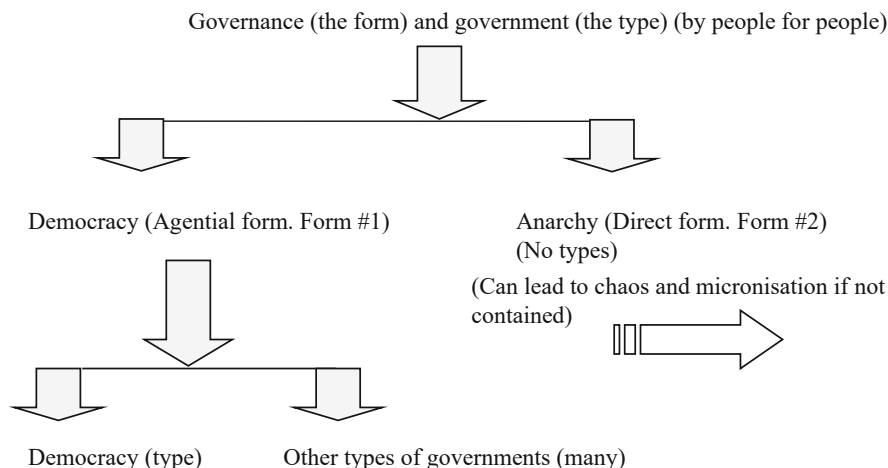

Fig. 1.2 Governance—alternate visualisation of governance in intelligent cooperative social species (*Homo sapiens*)

To sum up, in the present state of governance, democracy is one of the two “forms” (the other being anarchy) under which there are various types of governance through agents of people, one of them being democracy as electoral democracy which is considered to be and advocated today as the best without deep thinking (Fig. 1.2) This study considers all types of governments are equally good since it is not the type but the results that matters in governance (Box 1.15).

Box 1.15 Democracy: The Form, Type and The Terms

The term democracy is used as form and type. Form explains the nature of governing people by people. There are two forms: through an agent of people and direct. The first is considered democracy, the form with various types of governments under it, and the other form is anarchy, direct in the absence of an agent of the people that may or may not lead to anarchy and subsequent micronisation. Democracy is used as a term for the form of governance through agents following the ancient practices of people’s participation by acceptance or non-acceptance which continues today in various typologies. One of them is electoral and other explicit types of choosing an agent. They are presently termed as democracy, a type of government along with various other types. Here democracy appears as form of governance as well as a type of government. The former is comparable with anarchy as a form and the latter with any other governmental system as a type. This difference is important while mentioning democracy sans semantic dissonance.

The journey to the centre of the concept of national security begins here.

Chapter 2

National Security: Concept, Evolution and Descriptive Stasis

A human being is the most frightened form of life on the Planet (Paleri, P. (2008). National security; imperatives and challenges. Tata McGraw-Hill Publishing Company Ltd. p. 16. Author's quotation in the book was "A human being, perhaps, is the most frightened form of life on the Planet." The adverb "perhaps" is deleted in the new quotation. The author is convinced.)

2.1 Introduction

Humans, apropos their lives, have been individually and collectively acting out the reality blockbuster show, the game of life, spanning millennium runs every moment of their existence. Human life that way is a great sight and sound show. The characters are so intense in their reality roles that it will be extremely difficult to nominate anybody for the best performer award. They live out their characters in the show. The exactness of the reality show is that there is no one outside the cast to

direct or witness the individual performance. The cast themselves are the crew; they are the audience. The entire show itself is the trivia. Belief system is the script. Action is neural. It keeps changing without breaching the law of invariance within the limitations imposed by life, which provide the stage, props and the floor.¹ It is life, the ultimate human show. There is no other show on Earth that can surpass it in pomp and scale. But it cannot be played as one likes it. Worst, the script can mutate and transform when least expected unfolding ambiguously.

Humans always turned to governance to oversee them in the show as both crew and cast. But soon they found those engaged in governance were still characters who cannot easily shed their scripts in the main theme—the show for governance. They were unable to wipe off the grease of their makeup. It is natural. One can't blame those who govern. They buckle under limitations. The issue in governance by national security is human well-being by governance. How does one get to it? Simple, the characters should get out of the plot when governing and also critically tune in governing. The crux of the concept of national security lies in this statement. And interestingly every player in the show has a part in governance.

2.1.1 Needs, Wants and Governance

Ideally, the ultimate objective of any government is to secure the needs of its people through governance. Needs satisfaction is expected to lead governance to the well-being of the people. Well-being is a feeling of minimised insecurity rather than maximised security in human affiliations with life. In this appreciation, the difference between “needs” and “wants” is to be distinguished clearly for governance. While human wants are differential, human needs assessment is done better under the singularity perspective in governance.

Human well-being in an advancing world, which will remain monocentric² in terms of power at any given time but balanced by bipolar affiliations³ in a comparatively stable environment, is ultimately what will project the concept of security

¹“Melancholy Jaques” the Shakespearian character in *As You Like It* had spoken, “All the world is a stage, And all the men and women merely players. . .”.

²Monocentric in this context means one among all having control of the rest in terms of power at a particular moment, but not always in a bipolar situation. Here the assumption is that the world order will always remain bipolar and will never be unipolar except as a function of time and issues under strict balance. Otherwise, the system will crash. It is a natural process. Turbulence in social system shifts the power centre more so without warning.

³Balanced bipolar affiliations of nations are within countering forces at the ends of power axis. This is an interesting phenomenon that the author calls power flux based on the nature of axis. Power flux is not unidirectional as in magnetic polarity. It moves both ways between poles and influences others (this aspect needs further research).

nationally, supranationally⁴ or globally. That is not all. The world is structured within the boundaries of obsessive as well as possessive nationalism based on belief systems with a counter force, what the author calls the “anteforce”⁵ in this study. This stasis is expected to continue in the human system. Generally such systems are orderly or disorderly “decreed” by the interplay of the majority belief systems of the day. While on one hand nationalistic thoughts are said to be waning as indicated by pursuing conflicts within the system, on the other, geopolitical entities tend to withdraw into “molecular states” in the post-Cold War world. As long as they exist, in one form or another, national security gains precedence over supranational or global security.

There is awareness among planners and policymakers on national security. But the thoughts are focused primarily on physical (military) security and engagement lined with politics and diplomacy. There are deviations in the thought process, though. Non-military aspects of national security are getting recognised in a serious manner.⁶ Military facets are being drawn into the “lean, lethal, silent and zero casualty” (L2S-ZC) mode and “limited engagement rules” distancing from the adversary by reach by those who can afford such luxury in war fighting. L2S is a strategy, whereas ZC is a combat luxury for the militarily affluent.⁷ Nations that care about “matured public opinion” as well as capitalise in arms production desire zero casualty wars for them. But everyone cannot afford it. Combatants, non-combatant combatants and civilians will still die even on the luxury side because lethality of fog and friction annuls ZC in conflicts.

Nations are also not at liberty to invade or attack another at will today. The comparatively advanced world is monitoring. A war has global impact even if restricted in dimension. An invasion may be limited to the national power of the invader, but the world watch can impose limiting factors to war fighting. This situation and asymmetry of power equations have raised the chances of proxy wars and militant activism, which is war in a non-combatant form. This is a transformation that leads national security beyond the realms of pure militarism (military security) and engagement by other means including alliance militarism and rule of law (ROL). Investigation into these subjects not only makes the study interesting but also enables to understand procedures that will help in articulating the elements of national security in the changing world much beyond the realm of military security.

⁴Here the term supranational refers to multinational alignments including those with power to influence across borders, other than the present United Nations (UN), with common objectives. UN is taken as a symbol of global collective security at the instant.

⁵See Chap. 5.

⁶Strictly, the expression “non-military” aspects of national security is incorrect according to this study. There is only national security, not military and non-military securities as standalone concepts. Military security is an element among the 16 identified elements (Chap. 6) of national security that needs to be optimised along with other terrains specifically for national security. There are eight terrains. Elements and terrains are addressed subsequently.

⁷A term used to depict the countries for which war and conflict are business opportunities.

The expression “national security” is compounded by dual terms: nation and security. This is mentioned in the previous chapter. While determining the historic perspective, it is necessary to examine the expressions clearly with respect to their origin and philosophy before assessing the trend in future. Though the word “security” follows “nation” in the expression of national security, it is an older and more subtle notion within the individual concept. The term nation is relatively recent. Security means “untroubled by danger and fear”. Fear as a survival emotion is persistent in all living forms (Box 2.1). Overcoming fear is a conditional state of mind that makes one feel secure. It is hidden within the ambit of life and is the essence of existentialism and survival.

Box 2.1 Fear is a Persistent Survival Emotion

Fear is a persistent biological survival emotion in every living thing. Obviously it is highest in humans, being on top of the pile of life systems. Fear brings out insecurity. Fear cannot be avoided or washed out. It remains. Courage is not absence of fear but moving forward facing the threat in the best possible way in spite of fear.⁸

The idea of security has its origin when primitives identified fear in their early days of survival droning unremittingly in their intellectually evolving brains. When physiological fear intervened with psychological trepidations, humans started feeling insecure and anxious. It continues today, and the situation is depicted as existential problems. But in reality, fear cannot be considered a problem. Fear is a survival need for life to sustain. Or rather, in the reverse, life sustains by inherent fear. Fear is a sign of lurking danger and an indicator to cross it. Individual life form is not important here. It is life that matters. In the larger design, life sustains even if the individual dies. Or, again, in reverse thinking, life sustains through life forms which get eliminated or disposed of by death—the essential requirement for life to continue. Individual life forms get finally terminated by death as if to vacate the space for new. Otherwise life cannot continue. The planet so far has been conducive for life to continue since it began under the assured individual death condition leading to continuity in sustaining environment. Can it be said that planet Earth is only capable of supporting “life” on it but not the “individual life form” perpetually? Are such questions relevant when the answer is clear? Not exactly; “life” cannot sustain unless death is assured to the being before its birth. It is biomaths.

Existentialists⁹ prefer to term this state of unease as “existential dread (ED)”, anxiety created by uncertain existence. For the psychologist it is acute existential dread (AED) and a business proposition. In governance, existential dread is the

⁸Fear is necessary to act against it. Courage is moving ahead accepting the challenge in spite of fear. That is the psychology of fear about. Fearlessness therefore means not retreating under fear.

⁹Jean-Paul Sartre (1905–1980), the French novelist and playwright, was the leading proponent of existentialism—a philosophy that acclaims individual freedom.

“plain feeling of insecurity among people”. Why should one look at the fact that “life cannot be there unless death is an assured foreclosure?” The answer lies in the fact that security is not freedom from death. Security is further examined later in the chapter.

The concept of sovereignty provides certain reprieve to the stasis of existential dread. The idea of sovereignty originated with the Treaties of Westphalia in 1648¹⁰ and reaffirmed in the post-French Revolution¹¹ setting. The origin of the word *nationality* dates from the seventeenth century.¹² But more than the concept of nation states, the organised existence of humans in groups of various forms and traits provided the basic foothold for survival from the beginning. It extended to nation states in an organised manner irrespective of the form of government they had.

2.2 Studying National Security

The study of national security is required to be carried out systematically, circumspectly and incessantly without prejudice to identify truth from facts to arrive at reality sans dark appreciation of a concept however difficult it may be to assimilate in the conscience. Truth can be bitter as some say, but the same statement as a hypothesis needs further examination. Truth can be prospected from facts for governing human systems towards their well-being with considerable exactitude. The overarching hypothesis in this study is the “existence” of the concept of national security and its elements. Further hypotheses in the study of national security are that the concept itself is “evolutionary” in its original form with respect to a human system and, therefore, vital to a geopolitical entity. The concept of national security envelops the “well-being” of the people of the geopolitical entity, appreciated as a nation, and not its physical security alone.

Hypotheses require qualitative approach to test them for validity. A qualitative approach will be concerned with the objective assessment of attitudes, opinions and behaviours of the society. They are all modified by the core belief systems that rest security apprehensions. It is necessary to gain familiarity with the concept of “national security” within its evolutionary framework and against the background of its ongoing transformation to define it in the evolving context. Another requirement is to identify and articulate the elements of national security and test their interactive matrix.

¹⁰Business Week. “American Peace.” *The Economic Times*, New Delhi. 15 July 2001, p. 12. The Treaties of Westphalia on 30 January 1648 ended the “Thirty Years War” in Europe and ushered a new era in geopolitics. According to social scientists, this pact created the nation state, which could control its domestic affairs largely free from outside interference. Also, Encyclopaedia Britannica, 2001, CD-ROM.

¹¹Also called the Revolution of 1789

¹²Ayto, J. (1992). *Bloomsbury dictionary of word origin*. SaaB Publishers and Distributors

Considering the subject is evolutionary and related to human aspirations of survival, the period in the study of national security is the period of the entire human existence in organised groups however small the group would have been. Is there a time-sensitivity factor in national security studies? If not is it necessary to introduce such a factor? If so, what is the time period? It can be a detour in research. Similarly a bypass too can cut the truth from facts. Instead of examining these questions in detail, it has been assumed that national security is more a goal of governance than a function of time. In a lighter vein (just for the author), the concept of national security goes with each human similar to a casual gum spat on the posterior of a football fan changing shape along the way. The “shape” of national security changes from the original though it remains related to sapien concerns of existence. The study for this publication, therefore, equipped itself a large span of time in leaps and bounds till the current scenario of the new century and not a specific time or a period of time. What was important was not the past but its impact on the current scenario and futuristic convergence in a global environment. While there were breakups in the period, the connectivity of time is maintained without which the current scenario could not have been incorporated as a continuum. The space for the subject is occupied by the evolving world apropos to the dynamism of the topic with constant changes in scenario.

2.2.1 Limiting and Supporting Factors

The subject matter—the concept of national security—is historically cited, at various levels, but not universally defined. Being evolutionary, giving a final definition is difficult as chances exist for unforeseen variables to crop up in future. The subject is highly debatable. The definition of national security in this book is that of the author researched and identified in 2002 as part of a serious study.¹³ It is to be seen as future perspective along with other definitions of illustrious scholars. The topic can accommodate changing definitions being evolutionary.

The importance of the topic and its relevance in today’s world are the greatest supporting factor. This is a subject where it is important to think “how” and not “what”. There is no room for selective appreciation in hypothesis building; it has to be objective if the search for possibility has to be truthful. The concept, though evolutionary and, therefore, exploratory in nature, is being “delivered” today in its absolute form in the current and present world. It will be so in future too, hopefully more human friendly. The study of national security is, therefore, practical and the results are applicable, hence useful to a nation and the world in general. This makes the study passionate and obsessive, hence, the revisit.

2.3 Concept of National Security

The word “concept” means “a general notion, an abstract idea or, an idea or a mental picture of a group or class of objects formed by combining all their aspects”.¹⁴ A concept underlines thinking that in turn creates practical ideas. Concepts breed new ideas. The idea is perceived by the inquisitive human mind often oblivious to the complexity involved in defining it. The idea thereafter becomes a term, which its practitioners and others, who stand to “benefit” by it, define as understood by them sporadically. “National security” is such an idea. If understood clearly and practised precisely, the idea of national security can benefit humanity as a whole.¹⁵ Therefore, the perception is an important precursor for defining a concept. Definition leads to understanding.

2.3.1 *Approaching National Security Concept*

In an exploratory study, it is important to approach the concept carefully treading all available paths. No single path leads to the concept. The concept’s importance can be realised from this statement. This method, the multi-approach path, is suitable for evolutionary concepts where one has to look into time. Take all the paths and see whether all of them lead to the identified destination, because most of the clues could be hidden along the pathways. Once the pathways are identified, the probability along the track can be tested to understand the realities along the reference time. In such cases only zero probability indicates the path is foreclosed and non-existent. All other paths collectively lead to the destination though probability of findings may be different. The clarity may be affected, but the track is right and present. The pathways are, therefore, important. It also avoids damage by selective perception. The angle of perception makes a difference in the final outcome of any definition. In a strategic approach, thorough understanding of a term sans semantic dissonance is critical to the study. A slight deviation in perception can induce critical errors in final judgement. Perception has to be objective. The concept of national security needs to be analysed objectively. In the multi-track approach, the idea is not to identify and select the seemingly best out of them but to extract the truth about the concept from the facts that each approach can provide. Because human knowledge never lingers isolated in a particular field of study. It is spread out in all. Hence to extract the truth, it is necessary to churn every field related to knowledge and search for truth never endingly.

¹⁴Tulloch, S. (eds.). (1997). *The Oxford dictionary and thesaurus*. Oxford University Press. p. 294

¹⁵In the preface to the book, national security is quoted as a concept that has the power to become an alternate religion in a civilised world.

Eleven different approaches to security are examined below:

- (1) Needs-based approach
- (2) Psychological approach
- (3) Security vs. happiness approach
- (4) Philosophical approach
- (5) Historical approach
- (6) Political science approach
- (7) Legendary and mythological approach
- (8) Constitutional approach
- (9) Planners' approach
- (10) Military approach
- (11) Polar approach

2.3.1.1 Needs-Based Approach

In applied psychology, behaviour indicates personality of an individual relative to a situation. Since behaviour can change with respect to time and situation, the personality¹⁶ of a person is also subject to change. This methodology may not be appropriate while seeking answers to the problems of an individual within a group and related to it. It is because the individual behaviour has to cope with the changing behaviours of other individuals within a group. A generic way is to examine the behavioural aspect of individuals as part of human systems based on their needs for survival. Maslow's hierarchy of needs is an available tool. Abraham Harold Maslow (1908–1970) carried out research on human behaviour to understand the underlying concept of actualisation of human beings for survival in a competitive environment. He devised a system of hierarchy of human needs in five steps starting with physiological needs (food, water and shelter) rising to self-actualisation. It was a complex finding of that period in human behaviour.

The second level in Abraham Maslow's hierarchy of needs¹⁷ is the security or the safety needs of the individual. Coupled with the physiological needs, these are the needs to be free of physical danger and of the fear of losing a job, property, health, food or shelter. Though this theory is questioned with respect to its hierarchical definition, it is valid in a human system that thrives for existence and survival. "Survival" is the key word in the concept of security. Maslow places the basic human needs in an ascending order of importance that ultimately leads to self-

¹⁶Paleri, P. (2018). *Human investment management: raise the level by capitalising human*. Springer Nature Singapore Pte Ltd. p.61. In this study personality is taken as behaviour since personality and behaviour, if seen separate, are not comparable. Personality is an abstraction, whereas behaviour is real and present. Hence in human investment, personality (what a person is) is deduced from his or her behaviour (what a person does).

¹⁷Koontz, H., and Weihrich, H. (1998). *Essentials of management*. Tata-McGraw-Hill Publishing Company Limited, 1998), pp. 322-326

Table 2.1 Maslow's hierarchy of needs (Paleri, P. (2008). *National security: imperatives and challenges*. Tata McGraw-Hill Publishing Company Ltd. p. 17)

Steps	Needs
5	Self-actualisation needs (self-fulfilment, etc.)
4	Ego needs (self-esteem and the esteem of others, etc.)
3	Social needs (sense of belonging, etc.)
2	Security needs (personal safety, etc.)
1	Physiological needs (food, water, shelter, etc.)

actualisation as and when the previous need in the hierarchy is satisfied. In motivation theory,¹⁸ these needs work from the bottom up, once satisfied. The hierarchical levels are given in Table 2.1.

Maslow appreciated that mostly people wanted more than they have. As one's desire is satisfied, another takes its place in the hierarchy. In the case of primary need, it is food, water and shelter at step 1. Immediate need at step 2 is security. Transition to psychological needs takes shape at step 2. Physiological needs preserve life, but security is the key to survival. It is a powerful need at the bottom of the hierarchy and is essential to be satisfied for the humans to survive through their lives. From here it can be concluded that:

- (a) Security¹⁹ at step 2 is necessary for human well-being.
- (b) Security was originally conceived as physical safety; this perception is unchanged in almost all the thought processes.
- (c) But, interestingly, security is not the first. It comes only after the hunger games are combated.
- (d) Self-actualisation is at the top. It means Maslow's appreciation is that individual attains self-actualisation only after all the needs are satisfied.
- (e) He also believed self-actualisation was a psychological need (Box 2.2).

Box 2.2 Is Self-Actualisation a Need?

Self-actualisation in Maslow's hierarchy of needs, unlike physiological or psychological needs, is not considered a need that humans are attempting to satisfy under the national security concept of well-being. It is a productivity driver in an activity. A self-actualised human becomes more productive in an

¹⁹Samways, L. (2000). *The 12 secrets of health and happiness*. Penguin. p. 329. The author states that security does not mean happiness. Hapologists and clinical psychologists commonly view happiness as the next step in human life after security needs are met.

Box 2.2 (continued)

activity under reduced pressure and increased engagement. Humans can reach a level of self-actualisation at any time in any activity. This is one of the principles of human investment management (HIM).²⁰

Maslow's theory has been a subject of extensive research.²¹ It was identified that the strength of needs varied with the individual. In another research, the hierarchy was questioned. The researchers insisted that the upward movement of need prominence resulted from upward career changes and not from the satisfaction of lower-order needs.²² While Maslow's needs pertain to the needs of the individual at work environment, the issue here is about security and not the other needs of the individual. It is very clear from the group of needs that security and safety needs form the basic needs and, being at the lower level or what needs to be satisfied before what level, are the prime movers of anxiety in humans. The security needs existed from the beginning and were not induced with human advancement. The needs and their fulfilment assured continuity to human race. Such need fulfilment was individual based, and humans performed in accordance with their belief systems and perception of their state of security.

While Maslow's needs are based on employment and motivation, external and self-oriented, security in a generic sense involves all human beings in a social system. The principles of security complemented by the hierarchy of needs are applicable to all. However, for the unemployed and those who are not in need of employment, the hierarchy of needs may plateau at certain level earlier than for an employed, demanding more outlets for psychological upliftment. Hence, an unemployed society is more difficult to manage and prevent from slipping into moral degeneracy and rancorous dissipation that may find outlets for satisfaction considered negative by society watchers. However, in an employed society, competition to uplift psychological needs will be serious and, therefore, associated problems related to stress and strain that are often referred to occupational hazards related to human behaviour will be the result. A society that needs to be governed by a government of whatever nature comprises both the employed and the unemployed. One of the psychological problems with the unemployed is their activity untangle. Humans find it difficult to handle activities when they are under forced blankness. In reality, people don't work for money. The goal of governance is the well-being of all—the

²⁰In author's examination self-actualisation is considered not needs oriented but activity oriented. See Paleri, P. (2018). *Human investment management: raise the level capitalising human*. Springer Nature Singapore Pte Ltd. Needs are satisfied from activity; self-actualisation is activity oriented resulting need.

This changes Maslow's needs into four steps from five steps.

²¹Koontz, H., and Wehrich, H. (1998). *Essentials of management*. Tata McGraw-Hill Publishing Company Ltd. p. 323

²²Ibid

employed and the unemployed. Therefore, governance has to address the problems of both—the employed and the unemployed. In this respect, taking leverage on Maslow’s hierarchy of needs giving due concern to warts and all is important for the society as a whole.

2.3.1.2 Psychological Approach

Alfred Adler (1870–1937)²³ was one of the leading proponents of modern psychoanalysis. He was different from his contemporaries—Sigmund Freud (1856–1939)²⁴ and Carl Gustav Jung (1875–1961),²⁵ in the approach to the subject. He put forward theories on easy-to-apply psychology. He dealt with individual psychology. Adler’s theories throw light on the idea of well-being and its possibility.²⁶ According to him, civilisation plays an important role in the development of a person’s psychological goal.²⁷ It sets up rules and boundaries against which children struggle very early in their lives, until they discover how to fulfil their wishes in a way that promises both security and successful adaptation of life in relation to everyday realities. By security, Adler does not mean only security from danger, but that further element of safety that guarantees continued existence of humans under optimum circumstances. Children learn to secure it by demanding a safety margin beyond what is actually necessary for the satisfaction of their basic needs. The need is stronger than that would be necessary for a quiet life. Here there is a stumbling point: the expectations of humans with respect to security are more than what actually they need.²⁸ In fact what they “want” is more than what they “need”. In other words, there is “apparent security”, what one actually needs for well-being, and “perceived security”, what one perceives as necessary and therefore wanted. The perceived security is broader than apparent security. It is this, according to Adler, that creates a tendency in people for supremacy and domination. The chase for perceived security never ends. It is the driving force of life’s existence.

Here the truth from facts is not the crux of the issue. It is the question, “Can human beings ever be satisfied in life?” that is important. Even if the answer is “no”,

²³ Adler was an Austrian psychiatrist who researched on individual psychology related to social usefulness. He had a strong awareness of social problems. He examined individual psychology in relation to his total environment and experimented on developing a humanistic approach to human problems. He followed Sigmund Freud closely but later parted ways with him when he could not agree with Freud’s theories on sexuality and sexual motivation. Instead, Adler argued on coping strategy in individual behaviour.

²⁴ Austrian physician and founder of psychoanalysis.

²⁵ Swiss psychiatrist

²⁶ Adler, A. (1998). *Understanding human nature*. Translated by Colin Bret. One World Publications Ltd., p. 32

²⁷ Author’s finding in this study is that civilisations should be taken as different stages of a single civilisation of the human system—the unitary civilisation.

²⁸ Maslow also insists on it when he states that people want more than what they have.

Table 2.2 States of security perception by Adler (Paleri, P. (2008). *National security: imperatives and challenges*. Tata McGraw-Hill Publishing Company Ltd. p. 18)

Security	Inference
Zero security	Undesirable state
Apparent security	Desirable state
Perceived (inflated) security	Overly ambitious state

Maslow's theory of the hierarchy of needs is still valid as it is about the needs, not wants of the humans. Needs are common, hence singularity based; wants are diverse, hence differentiability based. That's not all. Adler compares human beings inferior to other living forms when it comes to survival. They can survive only in particularly favourable but limited conditions. The feeling of insecurity and inferiority is always present in human consciousness. This stimulus forces them to seek security through favourable conditions. The result is communal living.²⁹ The feeling of insecurity and inferiority is a constant stimulus to the discovery of adapting to better ways of life on Earth. There is always conflict between "zero security", "apparent security" and "perceived (inflated) security" (Table 2.2).

The instinct for communal living fostered human intellect to overcome the inferiority and insecurity of existence caused by inbuilt vulnerability. Mind became an abstract organ of thinking, feeling and acting. It cannot be visualised physically as organ. The security issues rose from the trials and tribulations associated with it. At the same time, security does not need psychological explanation with logical reasoning. While the fear of insecurity is persistent among all, it is the rich and the powerful who feel more vulnerable.³⁰ The fear is perceptible in a system where apparent security clashes with perceived security as the driving force inducing irrational reactions. According to Martin Kettle, fear created the "gated community" syndrome in our society.³¹ The bottom line is that security is an issue for those who have something to lose according to perception. The study of national security glides along the perception that everyone has something to lose at all times.

2.3.1.3 Security vs. Happiness Approach

One of the imperatives in security studies is its divergence from happiness. Happiness is not directly indicative of security. Happiness, as always told, is a feeling in the "mind",³² whereas security is the anxiety factor about life and existence. Security

²⁹ Adler, A. (1998). *Understanding human nature*. Translated by Colin Bret. One World Publications Ltd., pp. 35-38

³⁰ Kettle, M. "Americans Adrift in Ocean of Fears." *The Deccan Herald, Foreign Panorama*. Hyderabad, 9 August 2001, p. II

³¹ Ibid

³² The mind is not a tangible entity but an assumed set of neural cognition in humans that includes consciousness, imagination, intellect, perception, judgement, memory and so on. Author's

as a feeling is a “humming” constant, whereas happiness is an intermittent feeling of a kind of “über-moment”³³ even though the ability to be happy is coexistent. In scientific studies, happiness is based on specific identified factors: genomic aspects inherited from parents; circumstances including demographic factors, age, gender and ethnicity; and geographic factors besides personal history and status. According to studies, correlation between other variables like money, job security, marriage, sex, etc. is relatively small in terms of happiness. Humans have a knack for hedonistic adaptation. Happiness level may not alter even if income and other changes, considered positive, exist. Another component of happiness is intentional activity. Cognitive activities are included. One can feel happiness by pursuant activities (Box 2.3).³⁴

Box 2.3 Happiness is Homemade and Internal

Any human can get into the mood of happiness at particular times. Happiness is strictly internal homemade sensation by the interplay of a recipe of hormones. The term homemade is an allegory for self-creation. Happiness can neither be outsourced nor externally induced. It is vastly different from the feeling of security. Both are very expressive and interactive with well-being in humans. The primary identified hormones are dopamine, oxytocin, endorphin and serotonin. These hormones are triggered within the body under certain conditions that are associated with emotional activities. They contribute to the sentience of happiness in a human. There are others too included in the happy hormones list. There are also artificial happiness inducers such as narcotic drugs and psychotropic substances (NDPS). The downside of NDPS is that they raise the benchmark of happiness hormone dosage. The individual then becomes dependent to the inducer drug. This causes addiction. Dependence and collateral depression are the heavy prices the drug addict has to pay. Therefore it is better to be naturally happy without depending on any external inducers. A government cannot provide happiness; it can maximise well-being by national security governance. That may help homemade happiness collaterally. The so-called happiness index, widely used for comparison of countries and human systems today, is a crude method of measuring well-being and not acceptable for high-end national security indexing according to this study.

contention is that mind cannot be combined with a tangible entity like body as in “body and mind” but as a standalone concept in matters of governance. It can be considered a faculty of reasoning in human beings that functions as a process centre in the neural system. Mind thereby becomes a faculty of convenience to appreciate human power of reasoning.

³³ A moment or more that is pleasingly pleasant

³⁴ Singh, V. “The Happiness Mindfield.” *The Times of India*, Mumbai. 11 July 2004, p. 8

An interesting aspect is the “learned sapien quest” of happiness since ancient times. Among them the expressions in *Bhagavad Gita*³⁵ are comparatively old and relevant. According to *Gita* happiness is inherent. It is a human aspect that is there in everybody all the time. The acceptance of this theory is based on the projection of the innate character of a human when emotions and traits that mask it are removed even temporarily. Survival emotions in a human can cover the inherent happiness in self like the dust covering the shine of the marble floor (of course, not literally; not a good example, agree). Unlike happiness, security is associated with fear. Fear makes humans function and eliminate insecurity. The only solution to handle fear is to face it by action.³⁶ Governance is the action in national security.

Without exception humans crave for happiness in life. They want maximum possible happiness. There is semantic dissonance here. The difference in happiness and security is highlighted in the light of understanding them. There are questions: “Is happiness an emotion, a state of being, a feeling, a chemical reaction in the brain, a concept, an object, a knowledge factor, the mere absence of sorrow, a peaceful state of mind, or the true nature of self?” *Gita*, as mentioned, accepts happiness as the natural state of being a human. “It is neither a mental nor an intellectual state and it remains whether in the presence or the absence of thoughts; it puts an end to all finitude, bondage, and sorrow”, according to *Gita*.³⁷

Happiness, then, is inherent, born with self and thereby an entirely different stasis when compared to security. Security is a feeling of needs satisfaction. Happiness can be awakened from within. Security needs reciprocal aligning with external support factors contained in the overall aspect of governance. There is singularity in happiness; differentiability plays more in security.

Clarity is more definite when happiness is seen as individual (singularity) based, whereas security as a group (differentiability)-based personality traits is functional to time in sapiens. This is also the reason where a human system cannot assess gross

³⁵ The *Bhagavad Gita* (often referred to as the *Gita*) is part of the Hindu scripture *Mahabharata*, a socio-psychological epic treatise presumed to be narrated in Sanskrit around ancient times. It is probably compiled in 300 BCE. The date varies. The *Gita*, in 700 verses, is in a dialogue format between Lord Krishna and Arjuna, the warrior, in the *Bhishma Parva*, Chapters 25–42, in the middle of the Mahabharata War (Kurukshetra War). *Gita* is a narrative about life and self-realisation which in turn is about self-actualisation in one’s activity (karma) in life to perform better for the sake of the world. It answers all the questions from Arjuna to Lord Krishna on life. Followers of *Gita* believe it contains all the answers that one “needs” as it deals with the topmost need of self-actualisation through self-realisation. The reference to *Gita* here is on the matters of happiness and its characteristics as a feeling that only humans experience.

³⁶ Fear is a normal human emotional reaction—it is a built-in survival mechanism with which every life form is equipped with. Fear is a reaction to danger that involves both the mind and the body. It serves a protective purpose. Courage is not fearlessness but facing fear in a survival mode.

³⁷ Chinmaya International Foundation (2011). *Bhagavad Gita Course*. Chapter 5.7. According to the course in *Bhagavad Gita*, the study of *Gita* epitomes all that is of value which will surely usher in enduring happiness and true success in life. This means happiness is not a goal but a sentient experience that anyone can get in a favourable environment.

happiness and index it properly, whereas gross (national) security is possible to appreciate as a resultant of governance and index through suitable metrics.

There are countries that measure gross happiness index (GHI). There is also world happiness index (WHI). This study does not recommend indexation in terms of happiness competent to measure the outcomes of governance. Bhutan is one of the countries that follow gross national happiness (GNH) as a measure of people's comfort level. For Bhutan GNH is the main development indicator, not gross domestic product (GDP) followed by many other nations. The World Happiness Report (WHR) in 2020³⁸ rates Finland at the top and South Sudan at the end among 156 countries ranked on how happy their citizens feel themselves to be. There are many factors that are considered to arrive at the happiness level: log GDP per capita, social support, healthy life, expectancy at birth, freedom to make life choices, generosity, perception of corruption, residual confidence, etc. fall under this method. It is an indirect assumption of happiness which varies with various differentiability aspects. There are nine factors in Bhutan's gross national happiness assessment: psychological well-being, health, time use, education, cultural diversity and resilience, good governance, community vitality, ecological diversity and resilience and living standards. These are extremely complex variables to calibrate and validate accurately and may be suitable for general assessment but certainly not for comparison as parameters change among different citizens within as well as external to a country. An example is demographic density. The problems of governance are not similar to nations; therefore any comparison has to be based on single factor that is measurable and adjusted against calibrated and validated factors. For example, one of the factors of gross happiness is good governance. Quality governance is ultimate in predicting a nation's dynamism, synergy and sustainability. It covers all other factors. Happiness is an individual aspect. National security is about the sustainability of the nation through people well-being. Many nations considered to be happier than others vanished in history. An example is the Himalayan state of Tibet. The country could not protect itself when inhumed by a strong another. It lacked the sustainability factor.

Happiness of people will certainly elevate the people of a nation momentarily, but it need not lead to continuum survival.

2.3.1.4 Philosophical Approach

Philosophy is speculative enquiry into human knowledge that began with inner questioning about self and life's purpose and all that nitty-gritty the life has to offer. Philosophy, as a subject, began at a time when knowledge was just breaking

³⁸The World Happiness Report is an annual publication of the United Nations Sustainable Development Solutions Network. It contains articles and rankings of national happiness, based on respondent ratings of their own lives, which the report also correlates with various factors relate to quality of life.

shells to crawl into life by reasoning seriously. It is not clear whether humans began to philosophise life under extreme feeling of helplessness or was it an intellectual advance that would have anyway taken place in the normal course of time. If it is the former, does philosophy sustain insecurity without defining it? A philosopher opens the mind to the humanity explaining the essentials of sapien life in its brief encounter with reality. It is often assumed that people may be best understood by reference to their political history and geographical situation. The efforts of modern geopolitical entities to understand each other are always dictated to a large extent by a latent fear and distrust. This fear results in conflicts. It is the same within the communities. The truth is that people consist in what they believe.³⁹ An example quoted is the failure of the British to understand the Indian character in spite of a long colonial term.⁴⁰ Unlike other colonisers in the past, the British could not assimilate with India in spite of its long colonial reign. The feeling of insecurity was mutual.

According to philosophers, the elements common to both eastern and western thought should confirm us in the belief, so often repudiated, that the human mind is everywhere one and the same or at least that it operates in the same way.⁴¹ It is not a question of *consensus ad idem*—identity of mind—but the operability of the mind with respect to existentialistic environment.⁴² The seer-scientists of India regarded each human being as an integrated whole of body, mind, intellect and *atman*.⁴³ Thereafter they found the logic to interrelate them.⁴⁴ According to the western thinkers, this was an escapist mode through an exclusive preoccupation with spirituality.⁴⁵ But what no one was pointing out is that body is the odd one out of the quaternary elements. Body is physical and tangible. Other three are... what? Whatever, they are not similar to body. Can we link them together? Or, is there some incoherence? Whatever, there was certain concomitant indifference towards materialism in the Indian way of thinking. But it doesn't seem to be so in the present mode. According to Encyclopaedia Britannica,⁴⁶ "Indian thought (read ancient), however, was primarily philosophical and otherworldly, and was concerned more with escaping than with understanding". Whether acceptable or not, India has shown that spirituality can mitigate the pain of existentialism and one does not have to look for clarification elsewhere for the theme, especially among sceptics. Cause for an effect (though the effect soon turns to a cause for another effect) within the realm of spirituality is also another form of rationalisation that is essential for survival. But

⁴⁶Encyclopaedia Britannica, 2001, CD-ROM

Fig. 2.1 The security circle and the balancing rider of human mind (Paleri, P. (2008). *National security: imperatives and challenges*. Tata McGraw-Hill Punishing Company Limited. p. 20)

the fact remains that in a spiritual society there is an undernourishment of fear and, therefore, security threshold is higher. It is also an escapist mode in the sense that when the security is threatened and does not find a sociophysical answer, humans tend to escape to spirituality. This is a hypothesis—that of spiritual security—and is amplified beyond its scope and practice further in the book.

Philosophical evolution of security is, therefore, idealistic. It is the belief system, occidental, oriental or other cognitions, that rejuvenates and furthers its cause. Ideally in such societies, the role of the government for providing security should be less demanding than others without such inbuilt defence mechanisms or rationale engines. Identifying a complementary element of security—as in spiritual security—is difficult and gratuitous in the study of national security. Philosophically, security sense is never a void. What fills the void in an undesirable state⁴⁷ of security is spirituality associated with belief systems. This is shown diagrammatically in Fig. 2.1. It also explains why people tend to be more spiritualistic and superstitious when security crumples momentarily.⁴⁸ Faith and superstition arise when perceived security decreases and balances the otherwise normal human mind. It can be seen in the lemon and chilly hooks sold in millions across India, a symbol that is expected to ward off evil, which is hung daily by everyone from truck drivers to millionaires wherever they want protection from the evil eyes of fear. There are many such spiritual “hooks” all over the world, used to show that only god can help to change one’s attitude towards security when under fear. Even “that” god will be a chosen one. This blanket of security can be seen in the protective gems and talismans to everything they wear and do to outwit the fear of the unknown—kind of strategic missile shields in perception.

The circle symbolically defines, as in a pi diagram, the security level that each human being desires—the perceived security (what they want or desire unremittingly). It is the larger part of security appreciation. It cannot be filled by apparent security (need-based security as explained by Adler) alone because of the

⁴⁷ Normally it is “perceived security”, not “apparent security”.

⁴⁸ “Americans Turning to God to Heal”, *The Times of India*, New Delhi, 25 December 2001, p. 8. Mass prayers after a great tragedy, rituals accompanying traumatic events, etc., are examples. Many Americans turned to spirituality after the terrorist attacks on 11 September 2001, as reported in the media.

vicissitudes of the psychosomatic and somatopsychic⁴⁹ human makeup. Perceived security is unachievable and stops at apparent security if maximised. But the sapiens won't agree. They continue to struggle without achieving the impossible limit perceived by them. Throughout this struggle, the void is filled by spiritual security lest the perceived deficiencies should tip over. Spiritual security (not to be semantically mistaken for spirituality) fills the gap and balances life with warts and all. Spiritual security contains spirituality. It comprises a multitude of activities. Religion and god are just two outlets. In the convenience of spiritual security, there is also god for those who have no religious beliefs but have firm faith in cultural belief systems often mistaken for religion. God exists beyond religious beliefs as well as in the atheist belief systems. In the latter, the presence of god is in its absence. A conspicuous absence of an entity is its accepted existence and thereby rejection.

God may be one but is identified expediently by the sapiens under stress and duress to act as a catalyst for spiritual security. God is essential for human existence in a manner that will keep the drudgery of life accounted for. Human mind needs assurance that it is not responsible for the bad things in life. This assurance is essential for existence with a mind that is appreciated to be residing in the body. Religion in any acceptable form is essential to meet the spiritual security demands of an individual. Those who are not born into a particular religion and remain natural without being processed into an organised faith tend to believe the culture as the adopted religion. Strictly, if it is considered that religions are those created by enlightened people with Christianity at midway in the first century AD,⁵⁰ then those who are not in those religions are the natural people who may diversify in their concept of god. Unification of god within the religious community is what the seers who created religions have done. In some like Buddhism and Jainism, the original god was the "godlessness".⁵¹ According to *Gita* god is "One" and is the "Self" in everyone that can be attained through self-realisation.⁵² The god is not separate form or external to self. For every religion, the objective was peace against the evil of the day. The last of the major religious spate ended with Sikhism, 500 plus years back. Sikhism was founded in the Punjab, India, by Guru Nanak in the late fifteenth century AD. A close look at every religion shows astounding similarities. The asymmetry is trivial. They are in rituals, procedures and projections. No more religions are expected to come in the future. The world is in a different mode today. The next scenario could be transmutations or independence, but everyone including the pretenders will have an entity in god, the chosen one. God is an absolute

⁴⁹Paleri, P. (2018). *Human investment management: raise the level by capitalising human*. Springer Nature Singapore Pte Ltd. p. 191

⁵⁰For more see note 5, Chap. 24.

⁵¹Exclusive view of the author with due respect to the views of respective religious scholars and believers

⁵²Self-realisation according to *Gita* means achieving perfect bliss intrapersonally by understanding self intellectually. According to *Gita* "the intellect through mature thought 'I am the infinite Self' removes the ignorance created notion 'I am the finite self' and disappears even as it tries to grasp its true nature". Chinmaya International Foundation. (2011). *Bhagavad Gita Course*. Chapter 6.14.

necessity for sapiens. And from this point, the existence of god is very much justified. Even god cannot deny it. Rather god is important even to deny its existence. Denial cannot come without persuasion of acceptance. The interesting part of the whole episode of religion is the presence of god including “no-god”.

Spiritual security, as seen in Fig. 2.1, is space filler. It is an active entity that moves into the conscious mind devoid of security feeling and enlivens it. It is not all religion and god or godlessness. It is more a mind game that settles by itself. It fills the vacuum between apparent security availability and deficiency in perceived security that can never be achieved. Even apparent security can be achieved only under the most efficient form of governance. That too is almost impossible. This study on national security is to understand achieving maximum in apparent security, accepting the fact that there is a limit at the end of it. This leads to a serious vacuum that, if not filled, can make things worse for the humans with a mind. That is where the self-deceiving human intellect has invented spiritual security, which is not just god but everything associated with the vacuum that needs to be filled. It is a balancing force to assure existence when things go wrong, and wrong it goes every moment. This fact that spiritual security is not all about god and religion but far beyond them in day-to-day existence needs to be reiterated throughout the tango with apparent security. Some of the gods take the route of religion, but most of them were in the human perception much before religions originated in the world and may still remain after the religions and religious beliefs are totally vanished. It is a long way. In this study, god has the potential to outlive religion, though it is the addition of god that transforms a culture into a religion. Hence god outliving religion can be taken as contradictory to the pervious statement though both are true from abstractionist principles.

Spiritual security is self-hypnosis of a different kind that appears in many ways. It is not meditation or keeping the mind shut. The mind is filled and is vibrant with reality of unreality in spiritual security. From daydreaming, fantasising and role playing, in life spiritual security reaches out to the institutions of god. It takes different forms in individuals in unbounded manner. It is necessary in one form or another for every human in different dosage at any given time because the bubble of apparent security bursts frequently exposing hardcore reality that people won't be able to absorb or adsorb. Without the elixir of spiritual security, humans cannot remain balanced. It is the magic potion of existence. Everything what the humans do impact on spiritual security that comes in many different forms. There are plenty of human activities to stimulate the spiritual quotient when the security level is threatened: religion, festivals, traditions, rituals, family, sex, belief systems, food orgies, entertainment, creative indulgence (not by self-actualisation, which is an apparent security agent), gambling, liquor, narcotics, psychotropic substances, sports, cults, gurus, games, elections, Internet, pornography, music, arts, reunions, regression to the past (those good old days), massage, meditation, crime, perversions, violence and so on, a million human escapades can be added. One can call out the items indefinitely. Anything that provides comfort in the process of perceived security attainment adds to the concept of spiritual security as identified here. Spiritual security is an extremely effective way of life in a threatened environment that life

will always be. Seeking spiritual security to fill the gap between apparent security and perceived security is an individual bargain for which he or she is tuned by default. Promoting spiritual security measures like arts, entertainment, rituals, etc., in governance means supplementing the security needs of the people to balance the shortcoming in providing apparent security as well as to contain the masses within their perception of security. It is essential for governance. In India, often movies are said to be the “opium of the masses”. They are more. People need them. That keeps them at bay from challenging the providers of apparent security for their shortcomings. In fact movies and other means of spiritual security providers limit unrest and crime, more than they are blamed for creating them. A nation based on a particular religious belief system has the advantage of leading the people to self-comfort by religious spiritual security sidestepping the more difficult apparent security measures. Unfortunately this is a hypothetical case since nowhere there is a nation where faith is supported by identity of mind. In such systems, ethnic security (an element of national security, seen later in the book) gets affected seriously.

Belief systems carry humans to a plane of imagined self-efficacy in managing oneself without external support. It includes prayers, a process of self-hypnosis, and physical actions in mass hypnotic trances like dancing and chanting under a *guru* in wild imagination of self-belief like the acts of somnambulists. It is said that majority of people are somnambulists who come under trance without difficulty. They dance to the tune of anybody. Trance-induced belief systems help to a certain extent, at least alleviates the pain of existence. There are varieties of induced coping behaviour patterns. A person diagnosed for terminal cancer tries to get out of depression by going through alternate medicine and prayers when withdrawn by acceptance. The so-called superstitions⁵³ associated with human organs and genitals for vitality, use of charms and precious stones for the miracle power and protection from evil, etc. will continue as long as human beings exist. Without such balancing props, it is impossible to contain the phantoms of the turbulent mind considered to be inside the brain. The belief systems are seemingly induced by default for balancing the human mind in day-to-day activities. People do get highly exploited in this condition, though.

Writing at the time of French Revolution, Thomas Paine (1737–1809)⁵⁴ expressed his conviction that “a morning of reason” had dawned in Europe and that the dark night of superstition had finally been rolled back.⁵⁵ Incidentally, it was also the time the concept of nation states was knocking from inside the cocoon to make a grand entry into the strange world. What puzzles researchers is the date when the first morning of reason had dawned in the world. “I want to know”, said Voltaire (1694–1778),⁵⁶ “what were the steps by which men passed from barbarism to

⁵³ Superstition is an abstraction, hence not unreal though not real.

⁵⁴ British-born American revolutionary leader, political leader and philosopher

⁵⁶ Voltaire was the assumed name of Francoise-Marie Arouet who was a French philosopher and writer.

civilisation?”⁵⁷ It is not known. The evidences are so far misleading. In its philosophical evolution, “security” is universal, and the feelings of the people irrespective of their geographical and cultural differences are identical.

2.3.1.5 Historical Approach

History is important in this study. But, what is history? History studies the chronological record of events based on critical examination of source materials presenting an explanation of their causes. Or rather that is what history is supposed to do. According to a Persian proverb, *history is a mirror of the past and a lesson for the present*.⁵⁸ “Lessons of history” and “history repeats” are nonchalant phrases often quoted in statements. The word “history” originated from Greek “I know”. Though expected to be carefully analysed, history reflects pictures of conditioned and selective appreciation and guided perception. Therefore, in any research, reliability of historical documents is an important issue. It has to be tuned to intuitive analysis that the human beings are known to be capable of using their intellect, the only survival tool available to sapiens.⁵⁹ There are many scholars who are very particular in their argument that history should not be mixed with legend or myth, the three stages when time is pickled. But history cannot avoid the stale breath of legend, deformity of myth, pan ignorance, winking observations, social fallacies, religious sentiments, colonial capers and the mindset of aggressors. There are many more such reality busters that one in search of history has to overcome to get to the truth. The underlying feature of all these is fear, inherent in humans as a powerful emotion and catalyst for survival and existence. Fear drives humans and their history. The result is that from “I know” history graduates to “I want you to know”.

History is controlled by the relatively powerful. The reliability of history from this single fact alone, thereby, becomes irrelevant in any sort of analysis to find a solution to the problems of human societies. History is decided by the authority. The problem with history is not whether it repeats or not, but whether recorded correctly. History repeats and the past catches up with it (invariance); it can be experienced again and again. Hence if the statement “history repeats” is true, then the origin of the repeated history too must be true. This is one of the many ways to test history. This is also one of the indicators of the law of invariance in human system. If one wants to see the past, one has to look ahead. This is the mirror image of the statement “future is reflected in the past” or “history repeats”. So can one say, “Look ahead,

⁵⁷ E. W. F. Tomlin. (1986), *Philosophers of East and West*. Oak Tree Books Ltd. p. 11

⁵⁸ Bhagavat, V. (2001). *Betrayal of the defence forces*. Manas Publications. p. 7

⁵⁹ Intellect mentioned as a survival tool means using intelligence through discrimination (*viveka* in Sanskrit). Intellect is a term used in studies of the human mind and refers to the ability of the mind to come to correct conclusions about what is true or false and about how to solve problems by reasoning and understanding objectively.

you can see the past?" In this manner the false recording of history can also be extrapolated and fine-tuned.

Recordings of history, from autobiography to a nation's past, may contain suppressed or exaggerated "facts". This comes out of prejudice, loss of memory, ignorance, the indomitable urge to project better than reality, coercion, compulsion and many such behavioural aspects that are natural to human personality. There are "evidences" that many recordings in history are inaccurate. There are heroes and great people who were never born. Or, rather there is lack of evidence in the occurrence of what is projected in history. Does this make everything that is recorded so far in human history null and void in reality perception? Yes, unless they are sans prejudice or probability breach. So, was there somebody called Pythagoras or Shakespeare, or did that apple knock Newton's head? Did Columbus ever land in North America and failed to get his travellers cheque cashed because it was Columbus Day and banks were closed? Are those theories and laws recorded in various names their own? Well, one can extract a bit of juice from all these applying the sadistic squeeze of tax authorities for that last drop. But that is not important in this study. Here the subject is national security. The interest lies in identifying the history that supports the theory of it as an evolutionary human subject. It can take us back much before the expression national security was attributed to the concept. The law of invariance can throw some light into the discussion. It says anything in history that doesn't hold validity with the law of invariance may be watched with caution. History repeats; mendacity doesn't, in a human system. In other words history needs to be refined to get to the reality from recordings to get to the truth before intervention for human system governance. History, if official, can get not only distorted but also delayed in systems that demand vetting by inglorious authorities.

The Persian proverb quoted earlier appropriates history to two appreciated time frames: past and present. What about the future? Isn't history also about the time to come, as one says, the future, if it is all about looking into time? Can it be called futury? Already there is a term called futurology with many experts in the business of prediction. In fact every human is a futurologist in one way or another. Humans can "see" into the future. . .from minutes to aeons, streaming their beam of intellect. They do it every day, every moment in their survival odyssey. So, what is the difference? It has to be simple. History is about seeing or rather looking into time. . .especially the reference time to which human activities are tweaked. Time, whatever type it may be, passes through in relation to the entity whether human or otherwise. Humans feel and experience it. Other living things may be tuned to it. It is difficult to say because they don't wear watches or peep into smart phones. Time passes through nonliving things also. They don't feel it, because they have no feelings. There is a mix up here. One is reference time. It is in reference to the celestial aspects of the spin and movements of the planet under the never-ending hangover of the Big Bang. It is pretty bad; ask the planet. One day it all has to reverse like a pendulum on the backward swing similar to an office-goer returning home. The difference is that it won't be burnt out on the return journey like the homecoming office goer. It is the Big Bang in reverse, a kind of homecoming for the

multiverse before it swings again when Lord Brahma⁶⁰ (the allegory for reason here) wakes up. The return perhaps can be called the Big Crash. Whatever, history and everything else become quite insignificant within this giant wheel, “we-don’t-know-what”, that never stops but continues without beginning or end as energy in perpetuity. It can’t be compared to an emaciated office goer. Sorry for that.

The reference time is subject to the alterations of identified celestial entities. This is the time people use to refer to birthdays, anniversaries, moonrise or when the next train will stop at the railroad station. Looking into the time that has become irreversible or already passed is presently called history. People are used to it. To change them is not easy. But can the idea of history be changed and seen that what is mentioned as “futura” is also part of history? In other words looking into the future also becomes history, the other side of it. It means past and future is one as history. That also means law of invariance is acceptable, well almost. That further guarantees governance of future is possible if law of invariance is true. Wow! But one should not get über-active. What if law of invariance is not true and history is different if time has not yet passed over? Well, in that case even a wedding plan is not possible. Of course, that is not the reason why camels don’t marry. But humans do a lot more than camels do. They govern; they wed and sometimes get screwed up. But the fact is that they can see the future. That means history can be divided into two parts—where the time passed through irreversibly and that where the time is yet to pass.

If those who govern do not “see” what is going to happen next, then governance is not technically possible. And what happens next is what has happened already in sapient theme and time frame. That is the law of invariance. Governance is what “nations” do. Nations do forward planning; they carry out counterfactual assessments, sometimes much to the dismay of the opposition. They too see the future.

Humans always look into the future, into the time that is yet to pass through; they regress into the past into the time that has gone. In this equation present doesn’t exist even for a *truti*.⁶¹ It can’t be. Time doesn’t allow present to exist. What we call present is not a time function. It is a passage (if one can call it) of future into the past. If acceptable, there is a new concept here. If history is a look into time, then it also applies to time that is yet to come. It is not only historians who look into past if limited to the past. There are also enforcement people such as a cop investigating a murder, an inquiry officer exploring an accident or a forensic pathologist cutting through a body. They need to look into the past relevant to their topics. But in governance, it is strictly about looking into time that is gone and yet to come.

⁶⁰Lord Brahma is the divine deity of creation in the Hindu triad (*Trimurti*), the three forms of supreme divinity: creation, preservation (Vishnu) and destruction (Shiva). Trimurti is the functional manifestation of the supreme God in three forms. Together the manifestation leads to the Hindu belief system of Brahman or Absolute. It means the concept of the transcendent and immanent ultimate reality, Supreme Cosmic Spirit in Hinduism, the concept of Brahman central to Hindu philosophy, especially Vedanta.

⁶¹The base unit in ancient Indian time calculation which is equivalent to approximately 0.3μs (1 μs is 1 millionth of a second in SI units).

Collation of history and time can lead to an interesting aspect: seeing through time using the survival tool of intellect. The depth depends on the sharpness of the cutting edge of the tool. It can be blunt by improper use.

History, today, is about the occurrences in the past, the irreversible time frame. History in the normal case is based on the probability of occurrence. The probability of an incident to happen varies with evidence. The occurrence with highest probability is accepted as part of history (of the past) in any exploration or inquiry. But in official histories, the probability rule can be overlooked by authorities. Besides, probability even for a small fraction does not guarantee the occurrence of the incident. Shortfall in probability is covered in uncertainty. It depends upon the method of exploration or investigation and the metrics used. The methods can change as humans advance. Hence history gets rewritten based on the changes in probability as new evidence surfaces. This method can also be applied to write the history of the future. The probability of an incident to happen can be assessed. In fact humans do it in forward planning. The difference here is that assessing future leans on “the law of invariance” and the history of the past. It is the personal opinion of the author that history of the future can be comparatively more accurate if the element of anxiety prejudice is removed than the history of the past where the possibility of removing prejudice is lesser if not non-existent. History of the future can be a vital tool for the past, though based on accuracy. It is also important to understand that it is the history of the future that becomes part of the history of the past. History of the past is at its best in accurateness, if tested against the history of the future.

Evolution of security is more a socio-psychological phenomenon. It is not history. Both are time functional, though. Look at the Great Wall of China.⁶² It is a great barricade of the day constructed to deny unauthorised entry into the land ruled by Emperor Chin Shih Huang Ti (259–210 BCE).⁶³ For him it was a symbol of security consciousness. He ruled China 11 years after its unification over 2200 years ago (probability catch on the exact date). The Emperor seemed to be a man in great hurry and scared to death. He linked up the existing defensive walls into one great wall. On one side of the wall were the marauding Huns, on the other, the rich farmlands of his land. It was likely that the Emperor wanted not only to prevent the Huns from entering but also prevent his hardworking farmers from getting out. That would not have been but for food security as well as ethnic propriety. The farmers would have mixed with the wandering nomads and shattered the Emperor’s dream of a unified China.⁶⁴ In the end, the boundaries of Chin Shih Huang Ti’s empire

⁶²Dated 221BC (Qin dynasty)

⁶³Encyclopaedia Britannica, Ultimate Reference Suite, 2004, CD-ROM. Also spelt Ch'in Shih Huang-ti (First Sovereign Emperor of Ch'in). Ch'in dynasty established the first great Chinese empire. The Ch'in, from which the name China is derived, established the approximate boundaries and basic administrative system that all subsequent Chinese dynasties were to follow for the next 2000 years.

⁶⁴Gantzer, H. and Gantzer, C. “2000 Years of a Wall and Its Warriors,” *Swagat*, December 2000, p. 45. This syndrome of forced isolationism is there among many social systems in the world, though the psychology is changing under forceful global security forces.

became the traditional territory of China. It was good planning by an emperor. There is a lot in it—law of invariance, elements of national security, governance, futurity of China and more. The wall exists; if not Chin, somebody did it.

The Emperor's tomb is believed to be in Xian. Archaeologists found 8000 terracotta soldiers: infantrymen, archers, cavalymen, horsemen and charioteers guarding the emperor's tomb. The potters were expected to have created them to protect the emperor in his afterlife. The fear of insecurity extended even in afterlife in China, ancient Egypt and other societies. There are evidences in the tombs of the pharaohs and once powerful across the world. In a limited way, it continues even today. Fear and security are central to the activities of the powerful. The Great Wall of China and similar barricades of the past show the gated community syndrome existed all over and continue today with barbed wires across the borders of the modern nations and raised walls of the rich and powerful. Change is in design and transformation.

According to one side of history, humans started life from the African continent. The oldest human footprints found on volcanic ash are estimated to be 3.6 million years old.⁶⁵ They were hominids that walked around eating fruits. Slowly they learned to eat meat. Probably they were capable of using a stick for defence, attack or digging a hole on the ground to hunt small preys.⁶⁶ They had the insatiable urge to walk and run. This mobility on their feet took them to faraway places. They migrated to where they could reach looking for survival. Migration did not stop. In spite of ruthless competition, they stayed alive, multiplied and migrated for thousands of years. Throughout, they developed the skills to defend themselves against all odds. They discovered fire and collected before learning to make it. They were dejected when the flames went out. Fire was a precious resource. The skill of employing fire was one of the achievements of human race.

For a long period, the human race as a whole was in a pitiable condition compared to wild animals, for survival. Larger, stronger and sometimes dangerous animals outnumbered them in the vicinity where they lived.⁶⁷ Humans were physically smaller and lighter. Their physique, unlike that of other animals, was not designed for survival. But they had the power of the brain. They realised that the only way to survive was to organise themselves in a community system. This intellect seems to be the first major sign of security consciousness that dawned among the human race. This slow increase in human organising capability was a vital aid to self-defence, especially at night. Without that ability to organise against an enemy, the early humans venturing into new tropical areas might easily have been wiped out by animals of prey. By a long and slow roundabout mode, they migrated in a long never-ending loop from the tropics of Africa to the temperate zones of Asia. They

⁶⁵ Blainey, G. (2001). *A short history of the world*. Penguin Books. p. 4

⁶⁶ Ibid

⁶⁷ They climbed the trees and lived on them in the night to escape from wild predators. Today they can sleep comfortably in tall apartments in metros probably because of the security the trees gave them in their early days.

were essentially people of the inland and took time to settle along the coasts. It took further even to fish or venture into the seas.⁶⁸

The human brain also enlarged in the course of time from 500 cubic centimetres among the *Humanoids* to 900 in *Homo erectus* who carried out the long migrations. The growth of the brain and its structure was one of the remarkable changes in the history of human evolution. What is important here is that the fear and security consciousness that even animals depict in their life pattern have been visible in the early humanoids abstractly though different from the animals that surrounded them. The complications of evolution take credit for its development in today's form. The Great Awakening was visible some 60,000 years ago among the nomads. Death became as important as life. It is evident from their belief in the last journey and afterlife. It was also the sign of acute uncertainty these people felt about life.⁶⁹ Death often arrived silently and mysteriously. There was no forewarning. It was chilling. Death brought fear along with belief systems associated with it. The belief systems were permanently etched in the mind and carried forward to generations of descendants. It strengthened further at every turning point when humans witnessed violence and trauma. There was uncertainty all around. The quest for physical security was hidden within this uncertainty.

The history of the world is dominated by wars and conflicts between clans, tribes, empires and nations—one group fighting against another for domination driven by survival instinct. The first ever war in recorded history was for territorial conquest in 35,000 BC when the *Homo sapien* “advanced hunters” displaced the Neanderthals from their hunting grounds.⁷⁰ There is also a claim that the first war ever fought was for fire between human settlements. If that was so, it could have been further beyond.⁷¹ Countless wars, recorded and unrecorded, have taken place in the last 10,000 years.⁷² War and peace⁷³ are linked in their causation. Peace between groups has often been the result of subordination by acceptance that has been arrived at either by war or by threat of war. It was a kind of pecking order by dominant behaviour.

2.3.1.6 Political Science Approach

Political science is the study of the state and its functioning through its government and associated organs. In certain cases, political science is also considered in plural

⁶⁸ Blainey, G. (2001). *A short history of the world*. Penguin Books, 2001. p. 9

⁶⁹ Blainey, G. (2001). *A short history of the world*. Penguin Books, 2001. p. 13

⁷⁰ Castledon, R. (1994), *World History*. Parragon. p. 1

⁷¹ Fire was in use around 1.7 million years ago. The first fire would have been gathered and opportunistically stored, not “technically invented”; hence the war to forcefully raid the fire warehouses is probably in the open

⁷² Blainey, G. (2001). *A short history of the world*. Penguin Books, 2001. p. 537

⁷³ This study looks at peace as an abstraction, further explained

form to involve other subjects of statecraft that deal with the interests of the people. Political science existed in its older form in ancient days where the concept of king, and anarchy in the absence of one, has been highlighted. In the early Indian treatise on statecraft, *Arthashastra*, the theories of kingship and statecraft were highlighted in detail as per the prevailing state of affairs by its said to be author, Kautilya.⁷⁴ The treatise advocated the idea of the king's divine nature, having divine sanction of the king's office (there is a semblance to the status of the pharaohs of ancient Egypt). With more forethought, it was reconciled with an argument on the elective origin of the king. In a state without a king, the strong can devour the weak. Rule of law will be absent. It will be the powerful who will control; equality of citizens will be absent. These are the messages. The underpinning statement is divine sanction. In other words, sanction is required for holding the highest office of the state. It could come from anywhere, and as long as there is no formal authority, it is implied that it could be from the unknown, the divine sources. It was a vision with a pointer towards the future about the authority and accountability of the office of the king in whichever form it may be.

According to *Arthashastra*, the king has four functions. They are:

- (1) Acquire what is not gained
- (2) Protect what is gained
- (3) Increase what is protected
- (4) Bestow the surplus upon the deserving

In modern times, these functions could be termed as:

- (1) Wealth generation
- (2) Wealth retention
- (3) Profit generation
- (4) Profit distribution

It is an easy way to explain governance, though it is not all about national security. But the reality is about the accountability of the king in the well-being of his subjects—the people. The king was also the promulgator of *dharmā*.⁷⁵ It was enlightened monarchical paternalism that could very well be adapted in a democratically elected governmental setup.

The *Arthashastra* calls for the overall achievement as “happiness” of the people. Happiness was a common parameter in the olden days. It was not examined seriously as on today. Happiness was taken for security since it also speaks about protection as the main task of the king. It is about physical security. Monarchy thus guarantees protection against anarchy. Thus, the king's duty is also to avert disastrous

⁷⁴(300 BC) Also called Chanakya or Vishnu Gupta. He was the mentor, counsellor, minister and advisor to Emperor Chandragupta Maurya of Maurya Dynasty of Northern India (321–297 BC). He is credited to have authored the treatise *Arthashastra* that primarily is concerned about the state and its governance. It deals with property, economics and material success

⁷⁵In Hinduism and Buddhism, *dharmā* means the principle or law that orders the universe and individual conduct in conformity with this principle.

visitations such as famine, flood and pestilence. The king ought to protect also agriculture, industry, mining, orphans, aged, sick and poor. That is not all. Control of crime or establish rule of law was the duty of king, who may do it with the help of spies. Settling of legal disputes between the people was the assigned duty of the king as per *Arthashastra*. Kautilya presents a gamut of elements of national security in their period format in his treatise.

It is no different in modern-day political science. National security is the concept of safety for the territory and population of a state and, by extension, the policies adopted for preservation of their well-being.⁷⁶ Security is sometimes defined as the assurance of future welfare. According to this concept, national security might be regarded as the whole range of measures affecting the economic and social welfare of a population, as well as provision against aggression from abroad or subversion from within. Usually the term is invoked either when the safety of the nation is thought to be threatened by alien armed forces or when military action offers a possible answer to other dangers, such as a wave of illegal immigration or terrorist actions by non-combatant armed personnel.⁷⁷ Political science gives a concise meaning to national security. According to *International Encyclopedia of the Social Sciences* (1968), within the political frame *security is the ability of a nation to protect its internal values from external threats*.⁷⁸ Here the threat is perceived only to internal values. The threat dimension is singular.

2.3.1.7 Legendary and Mythological Approach

History is information slipped into immediate past or what is called irreversible time. Legend is the state of further attenuation that finally reaches the level of myth. The information will be further distorted by then. The information stabilises by distortion at myth and continues without another format as per the present appreciation of human intellect. The separators between history, legend and myth cannot be assessed accurately as they are limited by time, not space (Box 2.4).

Here, it is important to understand that any contradiction one feels after reading this section against the previous statements is “real” but appropriated to the topic of discussion. The contradiction will be basically on the appreciation of time and history. In this study history is referred to (1) history as normally accepted (mentions of the past), (2) history based on the irreversible time (past) and the time yet to pass (future) and (3) history that is seeping though the “non-existent” present into the past. It is explained further. But the usage of the term “history” unless specified separately means the way it is universally accepted at the moment (with reference to time assessed universally as time for activity reference).

⁷⁶Microsoft Encarta 2001, CD-ROM

⁷⁷Ibid

⁷⁸Romm, J.J. (1993). *Defining national security: the nonmilitary aspects*. Council of Foreign Relations Press. p. 4

Reference time (author) as accepted today is the time scaled on the rotation of the planet Earth and its divisions and explanations in various micro- and macro-formats. Time is an interesting abstraction. But it does not need a detailed outlook in this study except to the extent that it transforms history into legend and myth with passing time in human memory. This study will contradict the concept of history as mentioned earlier but will not extricate it.

The time that passes through matter “ferments” information into history, legend and mythology, in that order, relative to human intellect. Here history means part of the history of the past. Or rather, information attenuates into history, legend and myth with respect to time. This division is again on a reference scale relative to information. This also does not mean myth is better than legend or history like old wine being the most fermented. It is more distorted, rather foggy and unclear. Hence to release the right information, one has to refine myth more than legend which in turn has to be cleaned up from history. The three sieves or stages of refining are very important. It is not within the capabilities of insouciant or discriminatory examiners of the past. It needs the genuine skill and mindset of looking into the irreversible time. Information gets attenuated. The strength of information governs the attenuation by transformation as it seeps through unless it gets frozen in form and shape. This is a description of convenience to drive home a different point—curating and disseminating information from the irreversible time dimension.

Information gets distorted as time passes over it. In the reverse, it is similar to a space probe on its interstellar mission where the probe is the information. Relatively it is moving away from subject buckling original formation. Information is a deep subject more complex than cosmic journey, yet to be explored beyond the theme of grapevine. Information is vital in national security studies. It is one of the elements of national security. It will be seen later. Information which the humans keep on various issues today would have been based on the feedback from history, legend or myth based on human appreciation on the grapevine modified to the present. Yes, in this explanation present means the reference time that is frozen for the period. An entire human life or more can be “present” with reference to information. History has been already examined. In this section history is seen with some difference like a gum that is chewed a bit. History is the time that passed, and legends and myths are part of history in the larger sense. When seen together with legend and myth history is that part of the time that has just passed but not turned into legend and subsequently to myth vis-à-vis information. The three divisions of convenience will be with reference to information. To that extent, history, legend and myth are information specific.

Legendary stories, mythological tales and folklores, and other time-related packages of information project the concept of national security governance in many different ways. They are full of narrations depicting the pinnacles of glory of kingdoms where the kings were praised for their heroism and just ruling. From heroes, they become legends and slowly turn into myths with time before recorded in the abyss of human mind. Myth, legend and history when reversed and unfolded from the past in time become curated information. Is that a kind of time travel?

The quest for the concept of national security can be sieved through one such folklore. The caveat is that sieving is not information refining. Hence the conclusion is only specific to concept appreciation. The concept is national security.

The festival of *Onam*, a harvest celebration in Kerala,⁷⁹ one of the states in India, is synonymous with prosperity when people remember their mythical king, Mahabali, who was considered an epitome of benevolence. The mythological homily as it unfolds in situ recounts how the *devas*⁸⁰ on their envy dethroned him with the power of Lord Vishnu⁸¹ who, disguised as a dwarf-sized Brahman boy, sought the help of the king for three footsteps of land, for meditation.⁸² When the generous king agreed, the tiny boy metamorphosed to a size that was colossal and measured the whole earth with one foot and the sky with another. Thereafter the boy looked at Mahabali for the third step. The king understood who was standing in front of him but, known for his word, offered his head to step on. Lord Vishnu pushed him under with the third step but only after heeding to the prayer of the good king that he could visit his people once a year and see by himself their well-being and practice of ethical standards set by him. On that day, every year, the people of the state celebrate *Onam*, the festival that speaks about equality and prosperity under justice that only good governance can offer. The theme of *Onam* is in the form of a melodious folksong, ever popular among Malayalees, the people of the state. It reads as follows in Malayalam, their language:

*Maveli nadu vaneedum kalam,
Manusharellarumonnu pole.
Amodathode vasikkum kalam,
Apathonnarkumottilla thanum.
Kallavumilla, chathiyumilla,
Ellolumilla polivachanam.
Kallapparayum, cherunazhiyum,
Kallatharangal mattonnumilla.*

Roughly translated, it reads,

“All were equal during Mahabali’s regime,
A period of pleasantry and freedom from danger,
No theft, no deceit, not even a grain worth of lies,
No disease or epidemics, and unheard of was infant mortality,
Measures and balances were kept in order,
And no fraud of any sort.”

⁷⁹ A state in India established on 1 November 1956

⁸⁰ In Sanskrit—according to Hindu mythology, those with divine powers identified with the forces of nature and subordinate to one Supreme Being. They resided in heaven. Opposite to *asuras*—those who were considered as a class of demons who opposed gods and humans.

⁸¹ One of the principal Hindu deities, worshipped as the protector and preserver of the world and restorer of *dharmā* (moral order).

⁸² This analysis is at the point of the myth. It is not brought into the present scenario cracking through legend and history preceding the myth. The purpose is to attribute a meaning to the concept of national security in the light of human well-being.

Of course, it is an impossible stasis. It is a visualisation of some kind of *paradiso* sans existential trepidation. The people attain imaginary wish fulfilment of perfect, but unattainable, life through periodic role playing. That is spiritual security satiating the thirst for perceived security. There are millions of such celebrations in the sapient world governed by the law of invariance. They are critical to national security governance.

The concept of mythological *Onam* is about freedom from fear of insecurity and high ethical standards as the concept of well-being. It emphasises the role of the king as the security provider to the people. And in security, equality is certain. Kautilya's *Arthashastra* also mentions it.⁸³ Equality is the basis of the preamble to many constitutions in the world.

This lore is mythological. Mythology reflects happenings of yore in deep history. Euhemerus,⁸⁴ a philosopher resident of the Macedonian Court of the fourth century BC, argued that all myths are related to historical events and that the gods were originally humans who had achieved great success and who, after their death, received divine honours from grateful people.⁸⁵ Euhemerus was known by his *Sacred History*, a philosophic romance based upon archaic inscriptions that he claimed to have found during his travels in various parts of Greece. He was an expert in interpreting popular myths and connecting them to history. The word euhemeristic applies to such explanations of primitive myths. There are many gods, big and small, who, once upon a time in the past, were chiefs, warriors and saintly persons. In India, there are temples where movie stars are worshipped as gods in their prime time (understandably the deity pays the worshippers in hard cash unlike in the reverse!). There are also dedicated temples where gods were once humans. The fact remains that those who fascinated people historically became mythological objects of worship and veneration later on. They just travelled through in the minds of people after death and got immortalised lifelessly in different formats. The followers of Euhemerus may try their point through an inquest of history. But it is not accepted by students of comparative religion as the sole explanation of the origin of gods even if it is acceptable for accounting for the demons that are dime a dozen in any dark alleys of the human mind.

Within the gamut of mythology, the celebration of *Onam* conveys four points on governance and well-being:

- (1) Overall well-being of people is the appreciated goal of governance.
- (2) The government is accountable to people and their well-being.

⁸³ Singh, J. (1999). *Defending India*. Macmillan India Limited. p.12

⁸⁴ Greek mythographer who flourished in 300 BC and established the tradition of seeking an actual historical basis for mythical beings and events

⁸⁵ Cotterell, A. (ed.). (2000). *World mythology*. Parragon. p. 6

- (3) The government is accountable to people even beyond its time. In today's parlance the "agenda" of governance includes concern for the future generation.⁸⁶
- (4) All these have the underlying baritone that the overall well-being is an impossible task as it can question the challenge of survival seeking Utopian dream. Here is where a new law appears: the "law of limitations" in the overall sustainability of life.⁸⁷

Box 2.4 History, Legend and Myth

As mentioned at the beginning of this subsection, history is information attenuated into immediate past or what is called irreversible time. Legend is the state of further attenuation that finally reaches the level of myth. The information will be further distorted by then. History, legend and myth (HLM) thereby create a track that gets into a tunnel that becomes darker as one proceeds. The information stabilises by distortion at myth and continues without another format as per the present appreciation of human intellect. There is nothing beyond myth for the moment. It is not necessary under the law of limitations.

The interesting aspect of this transformation of information is that at any state there will be truth in them, where truth means original information before it became history, which can be found intellectually and astutely refining the distorted information. In other words there can't be history, legend or myth unless there was original information which could be factual or otherwise. But information is not knowledge.

There is difference between knowledge and information. Knowledge is steady. It is changeable only subject to the inherent falsifiability factor within the human intellect. Information wanes away but still with traces of facts. Hence it is important that the original information is refined well from data and further refined to gain knowledge. Data should never be mistaken for information and information for intelligence (Chap. 17).

⁸⁶The Agenda 2030 of the UN projects this statement. It is a commitment to eradicate poverty and achieve sustainable development by 2030 worldwide, ensuring that no one, including the future generation, is left behind. The adoption of the Agenda was a landmark achievement, providing for a shared global vision towards sustainable development for all.

⁸⁷In the overall when the myth is reversed, it may be found that the lore is tied to the reign of a real and benevolent king who, perhaps, under unforeseen circumstances was done away with or driven out of his kingdom. History, legend and myth in historical time of the past carry truth to certain extent that, outwardly, can be extracted.

2.3.1.8 Constitutional Approach

Constitution speaks volumes on a nation's approach towards its people and also in the geostrategic context. The constitution of a country is an excellent source of projection to appreciate the intentions of that country and, thereby, the expected psycho-sociological behaviour associated with it. The constitution holds the existence of the nation and its people. It reflects the country and its human systems. Constitution projects the principles set to be followed by its people and government. They are defined by the constitution. The citizens generally identify themselves with their respective nations, irrespective of the type of governments that govern them. There is a bit of catch here that will be condensed in the course of this study.

Democracy as a term has been associated with human system governance ab initio. That is why democracy is an interesting take in the study of national security, especially under the constitutional approach. Some hail the term as the most modern "type" of government today. Some may say it is from what the idea of governance took shape and hence the oldest.⁸⁸ They quote Athens as the cradle of democracy once upon a time (assumed to be the seventh century BC). Today it mentions the United States as the oldest and India as the largest democracies in the world. That is mediaspeak. If democracy is governing by the will and participation of the people, any type of governance can be brought under it where it shapes into a format of governance, not a type of government. Because any type of government has to have acceptance of the people willingly or otherwise including coercive submission. Normally it is the type of government that is identified as democracy today. But under the concept that democracy is governance with the acceptance of the people, any governmental format can be democratic. Even autocracy cannot survive without people's consent. Any form of government if acceptable by people even under oppression is democracy. They vote for it in situ by acceptance in silence. In the ultimate democracy, this silence is broken by the voice of the people, vox populi, into sound and fury, and subsequently withdrawing to normal. That is the prime difference.⁸⁹ The commonality will be a set of people who are not happy with it—those who didn't get what they expected. "It wasn't my choice, Pal, but what else can I do" type.

Whether the world will encounter another form or type of government, not seen so far, in the future or not is vague. But even if something new comes up, it will be with the involvement of people, tacitly or otherwise as it is now without much transformation. Existence of the law of invariance is critical to this statement. Therefore, the governments have to be in a mixed democratic format concentrated as in the present democratic form of governance or slight and concealed in other

⁸⁸ Athenians established what is generally held as the first democracy in 508–507 BC under Cleisthenes, often referred to as "the father of Athenian democracy".

⁸⁹ In a comment to the author during a study, the representative of an absolute monarchic state mentioned that the governance towards the well-being of its people is under the *consensus ad idem* of the people, or in another way that was what people wanted. Here the unexpressed consent approves the form of government, hence here is people's will for it.

formats. In this context it can be said even if a new form or type appears it can't be anything other than democracy in a different type dealing with people some under dissent. The question therefore is not whether democracy is new or old but is it something human system cannot get away with as form of governance and type of government. The experiment here is in the style of democracy where democracy is governance with the consent of people openly or subserviently. In principle that makes all types of governments peoples' governments.

This means the possibility is for further refinement of democratic procedures within type of governments, spreading equality among people providing opportunity for the commoner to become the king.

An example for democracy as a "type" of government can be India. India can be a facilitator for constitutional democracy. It is the largest democracy in the world. It has unique experiences in constitutional democracy. India has been hailed as the hallmark of the constitutional system in the world and a secular democratic country. The word secularism has been introduced in the Constitution of India after an amendment to give emphasis to the values it stands for. It has the endorsement of the world when the United Nations Development Programme (UNDP) reported India's multicultural nature as an example of equality of human beings.⁹⁰ Democracy is expected to support cultural diversity. Culture is an important part of an individual's identity in this world.

The preamble to the constitution of India articulates five factors:⁹¹

- (a) Justice—social, economical and political
- (b) Liberty—of thought, expression, belief, faith and worship
- (c) Equality—of status and of opportunity
- (d) Promote, among all, fraternity—assuring the dignity of the individual
- (e) Unity and integrity of the nation

India was a sovereign republic, and from 3 January 1977, it also became socialistic and secular with the 42nd amendment to the constitution.⁹² All these points of human equality and other concerns are common to nations or international organisations that support democracy and, therefore, are guidelines to identify the elements

⁹⁰Mitter, K. "UN Hypes India's Unity in Diversity". *The Deccan Chronicle*, Hyderabad, 16 July 2004, p. 11. This was pronounced in the UNDP's Human Development Report 2004. Cultural freedom and protection of cultural diversity is essential to prevent and resolve conflict.

⁹¹Basu, D.D. (1999). In the Preamble to the Constitution of India. *Shorter Constitution of India*. Wadhwa and Company. p. 2

⁹²Constitution (42nd Amendment) Act, 1976. The words "SOCIALIST SECULAR" were inserted in the Constitution of India. The 42nd Amendment changed the description of India from a "sovereign democratic republic" to a "sovereign, socialist secular democratic republic" and also changed the words "unity of the nation" to "unity and integrity of the nation". This was enacted during the Emergency (25 June 1975–21 March 1977) by the Indian national Congress government headed by Indira Gandhi.

of national security. The constitution of the United States, world's oldest democracy, has similar concerns:⁹³

- (a) Justice
- (b) Domestic tranquillity
- (c) Common defence
- (d) General welfare
- (e) Liberty

The charter of the United Nations (UN) can be taken as another document for examination. In the general sense, the Charter is a multilateral convention to which all members are parties. The Charter is also a Constitution.⁹⁴ What makes the UN unique is that not all members who embrace it believe in democracy in its accepted typology. It is ruled not by a government but by governments of the world in a democratic way.

The United Nations Development Programme in its support to human rights identifies seven freedoms:⁹⁵

- (1) Freedom from discrimination—by gender, race, ethnicity, national origin or religion
- (2) Freedom from fear—of threats to personal security, from torture, arbitrary arrest and other violent acts
- (3) Freedom of thought and speech and to participate in decision-making and form associations
- (4) Freedom from want—to enjoy a decent standard of living
- (5) Freedom to develop and realise one's human potential
- (6) Freedom from injustice and violations of the rule of law
- (7) Freedom for decent work—without exploitation

The constitutional approach in three different formats (two nations and one international organisation) shows the human face of the problem and what the constitutions feel the people need. They can drive the thought process in appreciating national security.

2.3.1.9 Planners' Approach

National planners assess the needs of the nation before making plans to achieve them. It will be based on their perceptions about the needs of a nation. J.R.D. Tata

⁹³Preamble to the "Constitution of the United States". Microsoft Encarta Online Encyclopaedia, 2001

⁹⁴Sloan, B. *The United Nations Charter as a Constitution*. 1 Pace. Y.B. Int'l Law. 61 (1989) International Law Review. Vol. 1. Issue 1. September 1989. <http://digitalcommons.pace.edu/pilr/vol1/iss1/3>. Accessed 2 March 2008

⁹⁵United Nations Development Programme. (2000). *Human development report, 2000*. Oxford University Press. p. 1

(1904–1993), the pioneer of Indian industries and commercial aviation, along with a team of intellectuals had a plan for India at the time of independence (1947).⁹⁶ The estimated population was 350 million. The plan aimed at economic growth and development of India. It was meant to guide the government of the day to steer the country to provide “a minimum standard of living” to the people. Five items figured in the planners list:

- (a) **Food**—to increase food production to provide 2800 calories per person per day.
- (b) **Clothing**—30 yards per people. The average per capita consumption of textiles was (for personal and household use) 42 yards in 1925–1929 for the world. The consumption of cotton was 16.1 yards in India and 64 yards in the United States.
- (c) **Shelter**—3000 cubic feet of fresh air per house and 100 sq ft of room space per person, which was minimum for physical use. In 1935, the area in Mumbai, India, was 27.58 sq ft per person.
- (d) **Health**—one bed per 250 people.
- (e) **Education**—Every person above the age of 10 should be able to read and write and take an intelligent interest in private and social life.

The plan was to materialise by developing basic industries: power, mining, engineering, transport, chemicals, armament, cement and consumer goods (textiles, glass, leather, paper, tobacco and oil). In addition, increase in agricultural production by solving the then prevailing problems of rural indebtedness and soil erosion. Expanding means of communication, railways, roads and coastal shipping was the infrastructural agenda. The per capita income in British India was 65 rupees in 1931. It was 22 times more in the United States, the country with the highest per capita income. This plan, however, never materialised. Jawaharlal Nehru (1947–1964), the first prime minister of India, had a different plan.⁹⁷ The Tata plan, however, shows the process of thinking based on human needs.⁹⁸

⁹⁶Sawai, A.L. “The Bombay Plan.” *Sunday Mid Day* (Mumbai), 25 July 2004, p. 5. The plan was to be a funded government, with short-term loans, balance of trade, foreign borrowings, internal savings of the people and new money created against ad hoc securities on the inherent credit of the government.

⁹⁷Ibid

⁹⁸In spite of the government rejecting their recommendations, the Tatas consistently worked for the economic progress of India on a visionary path. This is evident from the involvement of the group in India’s development from the corporate point of view. This was expressed by Ratan Tata with the laying of foundation for a skill development institute for the first time in India. The institute called the Institute for Skill Development will be with the collaboration of the group. India has a ministry exclusively for skill development. <https://www.msn.com/en-in/news/newsindia/government-has-a-vision-for-india-ratan-tatas-thumbs-up-to-pm-modi/ar-BBYZBNm?li=AAGgbRN&ocid=mailsignout>. Accessed 6 January 2020.

2.3.1.10 Military Approach

War is extreme behaviour between two or more groups engaged in conflict when other means are either exhausted or not speedy enough to settle issues or defending against an invasion where issues generally will be economic, religious, territorial, others or all together. War is a group activity; people get killed. Wars need not be exposition of cruelty all the time; there are examples of wars under fair practices and ethics. The laws advocated forbearance from killing innocents, targeting women, children, sick and the old and observing penance after a bloody war that may stretch to the extent of total abstinence from luxury and material pleasures. Emperor Ashoka's (304–232 BC)⁹⁹ life was an example where the king was engrossed in people's welfare and alleviating their sufferings subsequent to a war.

Warfighting follows its own rules. Fighting after sunset, killing a fallen enemy, humiliating a prisoner of war, plundering innocents, marauding the helpless, etc., were not permitted under the ethical value system concerned with human lives. The military hierarchies are no mean examples. There is utmost concern for the well-being of the individual and family within a military hierarchy and society. The qualities of a commander are judged based on the command capabilities that foster well-being and esprit de corps in the military and in the families of military personnel.

Even in today's scenario where winning is the only choice, there are internationally recognised laws of war that call for restraint in war and post-war activities in accordance with urbane behaviour. It is within these qualities the concern for the human being strives even in war. The code of conduct of individuals and groups when engaged in dealing with themselves and others during a war are clear and spelt out. Those who do not obey these principles are called barbarians, savages, etc. It only emphasises human concern for the well-being of fellow humans.

Thomas Cleary in his book *The Lost Art of War* translated from the original text in Chinese purportedly written by Sun Bin,¹⁰⁰ a lineal descendant of Sun Tzu¹⁰¹ and later came to be known as Sun Tzu II, mentions about the qualities of a commander. They are justice, humaneness, integrity, trustworthiness and superior intelligence.¹⁰² These qualities speak in a nutshell about the principles a military has to follow. They are also the desirable qualities that a leader of the people should possess to cater for their well-being.

⁹⁹The last major emperor of Maurya dynasty in India, around 265–238 BC. After a bloody war, he renounced armed conquest and adopted the policy of *dharma* (principles of the right path in life).

¹⁰⁰According to Thomas Cleary, the translator of the Chinese classic *The Lost Art of War* (Harper San Francisco, 2000), Sun Bin also known as Sun Tzu II was a lineal descendent of the Chinese military strategist Sun Tzu. It is important to note that there are also scholars who believe Sun Tzu was not a single person.

¹⁰¹Fourth century BC. Author of Ping-Fa (*Art of War*), the Chinese classic on military strategy. It is the earliest known treatise on war.

¹⁰²Cleary, T. (Translator and commentator). (1996) Sun Tzu II. *The Lost Art of War*. Harper San Francisco, 1996), pp. 2, 111-112

Looking at national security from the military point of view does not indicate the path to the overall well-being for the populace of a country. War is aimed at providing physical security for a nation when it is attacked by another. From the point of view of the latter, it is about resource mobilisation by extreme act of plunder and crime; however a military action is justified. Millions of people have died in war fighting and becoming victims of war. War has not brought well-being to anyone. Then, why people fight? Is war the purpose of war? This question remains unanswered. They will remain that way for some more time in a world that is realising the fallacies of war at its own pace—under the law of invariance. Till then wars will be there in one form or another. And the rest of the time, when there is no war, will be filled with conflicts. Peace is an abstraction in human life. It is only imaginary. Hence humans will remain in either war or other-than-war situations.

It is incorrect to say societies do not support war. For the majority wars are energy boosters and reality smackers. Wars can divert attention; they can be used to retain power or project it among local people. There are advantages for a government to engage in war in the domestic political market. There can be gains for the people engaged in war.

Governments and public accept battle deaths as cost to the nation in governance. In some parts it has become conventional wisdom that casualties are unacceptable. Certain societies have become averse of war casualties. But an attack is as good as a game where the people cheer their heroes and governments. Not much of a change from the days of blood-spilling gladiators.

2.3.1.11 Polar Approach

American thinkers were more baffled on 25 December 1991 at the lowering of the Soviet flag for the last time over the Kremlin than their precursors on 22 February 1946 when President Truman¹⁰³ received “the long telegram” from George Kennan¹⁰⁴ highlighting the need for a policy against Stalin’s¹⁰⁵ Soviet Union and spread of communism. The content of the telegram, after certain posits, leads to the containment policy and Truman Doctrine. Soviet Union micronised (the word disintegration doesn’t appeal to this study) into 15 parts on 25 December 1991.¹⁰⁶ Among them, the Russian Federation stood nonchalantly under Boris Yeltsin (1931–2007)¹⁰⁷ like a deciduous tree sans leaves at the end of autumn waiting for

¹⁰³ Harry S. Truman (1884–1972) was the 33rd US president (Democratic)

¹⁰⁴ George F. Kennan (1904–2005) was a US diplomat in Russia and historian.

¹⁰⁵ Joseph V. Stalin (1878–1953) was a revolutionary Russian politician and the premier of the Soviet Union.

¹⁰⁶ The eighth and final leader (president) of the Union of Soviet Socialist Republic (USSR), Mikhail Gorbachev, resigned and declared his office extinct and handed over his powers to Russian president Boris Yeltsin. The next day USSR was voted out of existence by the Supreme Soviet, following the Belavezha Accords.

¹⁰⁷ Boris N. Yeltsin was the first president of the Russian federation (1991–1999).

the winter to pass to “rebuild”. Or more appropriately resembling the ecstasy in the last scene of the beautifully magical American romantic drama movie “A Walk in the Clouds (1995)” where the character played by Keanu Reeves pulls out a burnt grapevine with living roots at the bottom to start all over again in the totally burnt vineyard indicating reality of hope.¹⁰⁸ The confusion at the moment of micronisation of Soviet Union arose from the thought process whether the world would now move on unipolar with one nation controlling the rest, designing their destinies, in a world sans communism.¹⁰⁹ No, that was not likely to happen.

The response from the author to the question about the feasibility of a unipolar world in future was a sceptical “no” when it was posed to him by the learned scholars in a semiformal discussion at the National Defense University, Washington, D.C., USA, in 1993. The hunch came from the way systems gravitate and balance in nature under bipolar support. Gravity is universal in balancing games. Gravity influences gradients that bust symmetries which exist in human systems also. Life systems are influenced by biophysics as much as by biochemistry and biology. The law of invariance in a human system is a sign of induced friction that indicates existence of a kind of stability inertia which can imbalance any time unless recharged with necessary energy feed. This energy feed comes from the two-point polarity in everything, whether a battery, nation or global human system. Polarity is balanced when it is “bi”, that is, when the system is bipolar.

What it says is that human systems struggle to remain dynamically balanced. The move to balance is continuous. It needs energy. The existential environment is dynamically agitating all the time within a bipolar stasis. This stasis prevents human systems from falling off permanently being under two opposing forces willing to stay together by pulling in the opposite directions like the Magdeburg hemispheres under vacuum¹¹⁰ pulled by two horses in opposing directions—yes, there is no third horse, fourth or fifth and so on. Bipolarity creates a continuously disparate condition towards existential balance in a living system (contradiction?). It makes one to oppose another for survival of life in an existential balance. Interestingly it is not about the survival of the entities involved but life that provides for the existence of the beings that oppose. Because total annihilation is impossible as long as life-supporting environment exists. Therefore, two opposing forces (bipolarity) have to be present in any living system—one strong and the other strongly attempting to acquire and possess the former’s ghost.

This posit establishes the fact that unipolarity is improbable or short-lived in perspective in any form of energy system balance. Human systems are biospecific

¹⁰⁸The movie was based on the Italian film “Four Steps in the Clouds”.

¹⁰⁹Communism may view simple living and modest affluence, but most of the leaders of the communist parties of the world were much ahead of even the super-rich according to reports and in no way different from other political leaders in materialistic luxury and in some parts dynastic nepotism.

¹¹⁰Magdeburg hemispheres were used by Otto von Guericke (1602–1686), the German scientist, who established the physics of vacuums, to demonstrate the power of atmospheric pressure. He was also the Mayor of Magdeburg.

energy systems in a highly agitated condition constantly thriving to balance. How does the balancing game work? Perhaps one may look at a spinning top or a gyroscope hunting for precession. The spinning top attempts to stay upright under the angular momentum. It is constantly pulled away by the torque created by gravity. Tipping over infringes the angular momentum. Slowing down demands energy feed to increase it. This creates a conflict situation that is essential. Human systems need the forces of bipolarity to stay balanced like the spinning top. The law of invariance gets generated in this process. The change is invisible or is not easy to appreciate at the moment of happening. This also means conflict situations are inherent in a human system. It survives under them. Therefore, resolution of conflict need not be an option. Contained retention of the conflict is perhaps the choice. But it is more difficult than yielding to a permanent resolution.

The poles in a bipolar system are not identical. If identical, the system turns unipolar. The poles are very distinct from each other. They have to be. In the bipolar system, the counter force will be in sharp contrast to the so-called dominating force to maintain balance. No system can exist unless balanced. The world became temporarily unipolar at the end of the World War II with the defeat of Nazi Germany when the United States and Soviet Union were poling together against the former. The temporary unipolar stasis had to break sooner moving opposite for the world to balance dynamically. That can be spoken as one of the laws of nature applicable to human systems: “Every human system, however large or small, dynamically seeks bipolarity to balance”. This also shows bipolarity is a natural force caused by the dynamic balancing of a system which is continuous as long as the system is not totally annihilated or destroyed.

The world cannot remain unipolar. A unipolar world sans the balancing force will fall. If that is a fact, then how is polarity determined? How will this affect governance and well-being?

In this study, polarity is determined by invoking singularity and differentiability of human systems. Here too the question is on balancing existence. Every human is anchored on a “faith” of his or her own or rather the strongest of all belief systems he or she is endowed with for existence, or rather to traverse the acute existential dread. Faith runs individual lives singularly specific to the awareness of the existential dread born very early in the individual human. Differentiability is invoked when governance appears differently from faith on collective human psyche where the individual of the collectivity experiences the result of governance differently. Faith is lead by either cultural religion or religious culture. For this lemma faith is also “absence of faith”. Absence of faith is faith in the psychological sense. The idea of God is same as the idea of gods as well as no-god—the no-faith acts as the anchor in the latter. Absence of faith, according to the author, is a fad based on human urge to be different from the other. It is rare to find, but a lot spoken. This will be examined later in the study.

Faith and governance (politics)¹¹¹ determine two different bipolar systems in the global human system which is reflected in the other smaller systems such as nation states. An individual or a state is affected by the forces between both the poles. It is important to understand that nation states in this explanation are not taken as a subsystem of global human system. Theoretically it may happen when there are other planets nearby carrying loads of people. It is not likely, well, never. Moon and Mars, the only probable uptown locations in the suburbs, have their own hang-ups.

The global system is a conglomeration of human systems in the form of geopolitical entities when viewed external to the globe. The two bipolar situations mentioned here are based on (1) faith and (2) political governance which originated with the development of “awareness” in the human systems where awareness is exactly not what the scholars call reasoning. This means two bipolar systems existed in human systems since the time religious faiths partially shaped into religious cultures from the original cultural religions.¹¹²

There is a general statement that religion and politics form the root cause of all problems in the world, whereas this book looks at them as balancing forces in the human systems with lots of similarities. Here religion is one of the belief system-based ways of living. Formation of nation states formalised the political systems as the new faith-based cultures riding on the persisting faiths. Faith percolates into governance through its fields of polarity. Frankly every human who indulges in politics (which everyone is) follows two faiths as the controlling faiths—political and religious. It may look as kind of duality. Surprisingly they are both the same in characteristics with politics of the day acting identical to the religion of yesterday that still continues! Does this indicate religions of yesterday will ultimately merge with politics of the day? No wonder bipolarity balances each other! Is it because they are the same!

Wake up from the intellectual snooze. Political polarity supports well-being in the form of apparent security within limits, whereas polarity based on religion supports perceived security in a mode determined by the faith. So the question which is widely asked in scholarly circuits—“which is more important: nation or religion?”—can be answered in a staccato fashion with “yes-no” answers as if in a binary system. Or it can also be answered with a counter question, “Is there a difference?” The binary leads to dual bipolarity, rather binary bipolarity. The counter question leads to simple bipolarity. The latter is not acceptable in research on human well-being as politics and religion need to be separated though they are similar (seen during the snooze). This is rooted on the theory of singularity and differentiability of human system and their inseparability. This process has to continue till religion is totally

¹¹¹ Governance is not exactly politics. Besides faith and politics have a lot in similarity.

¹¹² This lemma will be further explained. The cultural religions are the original belief systems where people took to God which later bifurcated to No-god, in which culture precedes the faith and religious cultures are where religion induces changes in culture and religion supports faith in God or No-god (the entity belief that serves as an anchor which is very essential for existence). Today’s politics is a religious format. Hence any human or a group is a believer of a specific cultural religion or a religious culture as well as a political system. This also justifies the two bipolar theories.

replaced by politics, which is not likely for years to come.¹¹³ Hence faith is separated from statesmanship as an influential factor of national security which is a topic of human system governance and not religious governance. Ever seen a¹¹⁴ closed loop with two foci?

The political global polarity is decided by the positioning of two nations based on their governing powers. The one that has the potential to be the superstate¹¹⁵ slowly edge to take over the leading polarity status dislodging the existing. The one that is replaced may contrast the new superstate as the other polarity or may yield to a third who by then have gone ahead to become the other pole. This forms the political bipolarity based on governance as the nation systems. The rest of the nations dynamically align with one or both poles under varying circumstances along the field of force or rather field of flex, still ideally proceeding in the direction of the future polarity. Every state has a chance to hold one of the poles one day. This means there has to be two geopolitical entities in prominence with respect to their power to hold the political polarity.

The other polarity is based on the dominant faith or belief system which is the singularity factor. The individual of similar faith though holding individual values and opinions will ally with the identical faith in the overall. Among the faiths there will be a dominant one which is demographically and distributively decided and another thriving to be dominant. They form the two faith polarities attempting to dominate each other and other religions including those with no religions—cultural religion or religious culture. Faith precedes the state in formation and within faith cultural religion precedes the religious cultures. But it is normally the religion based on religious culture that will be dominant as it will have more surviving power being refined by regimentation and highly upgraded system control. This will also intensely modify the cultural religions to transform into religious cultures.¹¹⁶

¹¹³Communism attempted this technique but did not succeed. Some of the members of the party believed in “No-god” as God, and many others privately continued to believe in God in spite of being in the party. Perhaps God doesn’t know.

¹¹⁴It is called an ellipse with major and minor axes. The author keeps the ellipse out of this study but mentioned it for future research by interested scholars on the mentioned binary polarity. Is it also natural in an atom as well as the solar system? Does the ellipsoid factor ring a bell in human intellect?

¹¹⁵Superstate is not superpower though it could be. Superstate is the state that can influence the rest of the globe by its overall strength of national security governance not just military or other elements of national security. This study does not identify any superstate presently as the concept of national security as projected here is yet to be finalised and the metrics for national security index assessment are to be researched.

¹¹⁶It may be noted that cultural religions may have many religious cultures within them as they will be small and would like to gain support of their parent cultural religions in a case of individual existence.

2.4 Recipe for Security

From the approaches above, as desired and aligned, one can roughly prepare a recipe for security. The reason is not that the studies yield much to the subject, but the subject itself is simple to appreciate. Humans are born frightened. Without fear they will not exist, just like the feel of pain makes one care for the body. By security, it means keeping the fear under control and using it positively for survival. The fear is already there by default. It is mental and emotional. It also means it cannot be prevented or preempted. It can only be mitigated by balancing and conversion to positive support for survival by whatever means. Governance is the easiest approach available to humans to assure long-term well-being within the anxiety envelop. Governance seeks a provider, whom the people agree by agreement or disagreement, by participative governance. Humans have a mechanism by which the individual, the final target of well-being, takes care of the balance area in the security circle—by adopting spiritual security measures by default. Anything goes with that, and more and more methods could be expected in future within the realms of spiritual security to cope with life that will always remain incomplete. The incompleteness carries the secret of sustenance.

Humans cope with situations through coping behaviour. This behaviour can be different in people and evolve continuously. Under this cover, even creativity develops. Creativity actually comes out of self-actualisation. There are also scholarly expositions that creativity leads one to self-actualise. So what should the government do first in governance? Induce creativity or prompt self-actualisation among the people? It may help to open up an environment for people to be creative and self-actualised. Perhaps this is what one should thrive in any human system whether micro or macro. But it is not all that easy as it is to be done by people in authority or with appropriate authority, official or otherwise. They too need to be creative and self-actualised. This makes the security circle quite vicious and interesting.

Since creativity under self-actualisation is topmost in the hierarchy of human needs, it also has a place as coping behaviour. This can be taken to conclude that creativity links apparent security with spiritual security where the changeover interface ends. Creativity is the common icing in both apparent security and spiritual security. Spiritual security is complementary to apparent security. This book does not deal with spiritual security in detail. It is on apparent security extending to the line of perceived security dealing with physical, mental and emotional aspects of national security. It will be seen only after examination of the principles of a nation state and its defined end objective, if any. Security will be examined once again in the light of national security in the concluding part of this chapter.

2.4.1 *Organised Groups and Prelude to Nationalism*

Formation of organised groups is the basis for human survival as humans learned fast that they can survive if organised. They became social entities instead of individualised like some of the other life forms. It was primordial or rather seen in nature. In organised groups, an individual has to behave as per the needs of the group to satisfy its interests that in turn benefit the individual who is part of the group. In a strict sense, it was not sacrifice but coping behaviour in organisational need that accrued benefits to the individual's quest for survival.

Forming communal groups by humans for security reasons is the beginning of the concept of organised defence. According to Adler, it fostered their most notable instrument for protection against the rigours of life—the human mind.¹¹⁷ In this way, they stayed alive and raised families. From there it was a long way to nation states, the refined form of organised groups with marked territories, satisfying in a well-pronounced manner the inherent territorial instincts of individuals and groups.

For some historians, the prelude to nationalism was in the crusade to abolish slavery and bondage led by people of compassion. The thirst for equality became the hallmark of the period. Nationalism was one of those ventures for equality but latently turned to inequality as an outcome of the movement.¹¹⁸ The sense of equality¹¹⁹ was within the boundaries of kinship; it was not extended to people belonging to other income groups and social classes. It still continues within the boundaries of nationalism.

2.4.1.1 *Treaties of Westphalia and Sovereignty of States*

The year 1648 changed the world that endowed associated rights on people. It happened in Europe. The Treaties of Westphalia brought an end to the “Eighty Years’ War” (1568–1648) between Spain and the Dutch and the German phase of the “Thirty Years’ War”¹²⁰ (1618–1648). The Spanish-Dutch treaty was signed on 30 January 1648. The treaty of 24 October 1648 comprehended the Holy Roman Emperor Ferdinand III, the other German princes, France and Sweden. England, Poland, Muscovy and Turkey were the only European powers that were not

¹¹⁷ Adler, A. (1998). *Understanding human nature*. Translated by Colin Bret. One World Publications Ltd., p. 36

¹¹⁸ Blainey, G. (2001). *A short history of the world*. Penguin Books. pp. 493-511

¹¹⁹ Equality mentioned here is the right-based equality, where everyone is equal as in the folklore for Onam (see Sect. 2.3.1.7).

¹²⁰ The Thirty Years’ War started as a religious civil war between the Protestants and Roman Catholics (the two major divisions of Christianity based on the belief in the meaning and authority of the Bible subsequent to the Reformation movement (1517–1648) in the Christian church because of alleged corruption in the Catholic church in the sixteenth-century Europe). The War in Germany engaged the Austrian Habsburgs and the German princes. The war soon developed into a devastating struggle for the balance of power in Europe.

represented at the two assemblies.¹²¹ Under the terms of the peace settlement, a number of countries received territories or confirmed in their sovereignty over territories. The territorial clauses all favoured Sweden, France and their allies. Besides territorial changes, a universal and unconditional amnesty to all those who had been deprived of their possessions was declared, and it was decreed that all secular lands (with specified exceptions) should be restored to those who had held them in 1618. Even more important than the territorial redistribution was the ecclesiastical settlement. The member states of the empire were bound to allow at least private worship, liberty of conscience and the right of emigration to all religious minorities and dissidents within their domains. The constitutional changes made by the treaty had far-reaching effects. For Germany, the settlement ended the century-long struggle between the monarchical tendencies of the Holy Roman emperors and the federalist aspirations of the empire's German princes. The Peace of Westphalia recognised the full territorial sovereignty of member states of the empire. By this and other changes, the princes of the empire became absolute sovereigns in their own dominions. The Holy Roman Emperor and the Diet were left with a mere shadow of their former power. Not only was the central authority of the empire replaced almost entirely by the sovereignty of about 300 princes, but also the power of the empire was materially weakened in other ways.

Germany thus became the principal theatre of European diplomacy and war, and the natural development of German national unity was delayed. But, if the Treaties of Westphalia pronounced the dissolution of old order in the empire, it facilitated the growth of new powers in its component parts, especially Austria, Bavaria and Brandenburg. The treaty was recognised as a fundamental law of the German constitution and formed the basis of all subsequent treaties until the dissolution of the Holy Roman Empire in 1806. The Treaties of Westphalia ushered in a new era of geopolitics. The pact, in course of time, created the nation state, which could control its domestic affairs largely free from outside interference. Today's nation states follow the European model lock, stock and barrel. Or, is it hook, line and sinker? People may not know. Will religious superimposition through binary bipolarity change the model ultimately? Perhaps, not; humans have many limitations to getting

¹²¹ Encyclopaedia Britannica, 2001, CD-ROM. Count Maximilian von Trauttmansdorff represented the Holy Roman emperor. The successful conclusion of the peace process was attributed to his sagacity. The French envoys were nominally under Henri d'Orléans, Duke de Longueville, but the Marquis de Sablé and the Count d'Avaux were the real agents of France. Sweden was represented by Johan Oxenstierna, son of the chancellor of that name, and by Johan Adler Salvius who had previously acted for Sweden at Hamburg. The papal nuncio was Fabio Chigi, later Pope Alexander VII. Brandenburg, represented by Count Johann von Sayn-Wittgenstein, played the foremost part among the Protestant states of the empire. On 1 June 1645, France and Sweden brought forward propositions of peace, which were discussed by the estates of the empire from October 1645 to April 1646. The settlement of religious matters was effected between February 1646 and March 1648. The war continued during the deliberations. These people are responsible for the concept of nation states, perhaps the most important turning point in human history of collective living, of course the style, many may argue, was European.

on to the fast track. The natural frequency of the human rhythm decides the moves. Inducing artificial frequency collapses the whole process only to get back again.

The basic concept of a nation state is that the people identified with it have their own powers for governing it. The means may vary. Etymologically, a nation is a breed or stock¹²² that has been born. There is a notion of common ancestry in the origin of the word.¹²³ Over the period a nation became an organised territorial unit. The derivative nationality dates back to the seventeenth century, the days of Westphalia. A nation, therefore, is made of people who identify with each other. They are sentimental about their territory and want to protect it. They symbolise the territory the way it appeals to them for this purpose, and they identify themselves with it. The territory does not identify with the people, but the people identify themselves with the territory in whichever shape and condition it may be. It is a matter of pride and honour and reflects in their behaviour, more when it is competitive with other territories. A nation will also have its own history mostly distorted by parties of interest. The history will speak about its journey to the day and how difficult it has been for the heroes of the past (the mode here is history-legend-myth), to retain the flame burning, whom they find worth remembering for their sacrifices. It repeats the survival theory of history, legend and epic. Dead people will be leaders whom living leaders will quote for exciting their secondary followers. The nations will also identify a founder figure¹²⁴ besides a flag that the people can proudly display and an anthem that they can sing on special occasions. Nationalism is ingrained in many such props of display, most of them originated from pre-nation state days. The people share the history of their nation. (This behaviour has something to do with the fans adorning the uniforms of their favourite club in a football match.) And the biggest point of pride for the people of a nation is the value system they share and brag about. And the value system will always be rationalised when criticised with matters that are internal. The nation, therefore, becomes an abode for people who were there originally. They will sing together that their nation is better than all other nations in the world. It is not clear whether the trend is changing gradually with external migration and clash of ethnicity. There are changing viewpoints even within families between generations with the descendants becoming loyal to their adopted nation of citizenship. But the concept of nation states will remain firm for years to come.

This is the ideal situation in a bipolar political system that is not binary. Superimposition of religious polarity changes the political national fancy into religious national fancy where in the opposing religious national polarity will be working to impose the influence of religious beliefs into nation and owning the nation belonging to the particular faith. The parenthood (motherland or fatherland as appropriate) will

¹²² Ayto, J. (1991). *Bloomsbury dictionary of word origins*. Goyal Saab. p.361

¹²³ Ibid

¹²⁴ It is interesting to note that there is hardly a woman founder for any nation; even if there is a claim or title subsequently given (acceptable to this study), the majority are men. Does it come out of the hunting instinct of male *Homo sapien*?

not change but will be owned by the influential making others secondary in an agitated position. The degree will depend on the cultural values followed. That is when people will become refugees in their own country often coercively with the tacit support of the powers in government. It happens once a while, though there is heavy opposition against it. It happens under failed governance but such governance need not last long.

2.4.1.2 State in Political Philosophy

In political philosophy, the state is a deeper, wider and more comprehensive entity. It is conceptual as an entity. Governments in various forms and orders are perpetual in the lives of communities as operating agencies. State is the “body politic” in its strict sense.¹²⁵ State is a political system or arrangement based on law. Law is both primary and secondary. Primary law is the constitution. Secondary law is by which the state is governed. The system of a state is protected by the military and other forces both armed and unarmed. A nation state is a nation, which is a state in its governance. It may also be seen that there are states where the enforcing agencies are government-approved militia. Here the problem is that the rule of law is not strictly applicable under the constitution. Opposition to the government is permissible subject to the rule of the law. Hostility to the state amounts to treason if it is from within. In reality, there is little difference between the state and the government. The quest for security was originally vested in the “king” normally under dynastic lineage. The dynastic principles run even today whatever may be the form of government. It is natural in every human activity that demands succession. Interestingly people pay obeisance to those who govern them in every form of government though the government is their agent under the agency theory of ownership. Follow the leader is a syndrome that developed in the very early stages of human history.¹²⁶ But the reward is that good followers become good leaders. The leader of a group is synonymous to the king.¹²⁷

¹²⁵ Ayto, J. (1991). *Bloomsbury dictionary of word origins*. Goyal Saab. p. 499

¹²⁶ Toynbee, A.J. (1957). *A study of history*, Vol. 2. Dell Publishing Company. p. 125

¹²⁷ The word “king” is used here to depict the ruler whether male or female. The preferred use for “queen” is to depict a female married to a male “king” provided the king is a single individual who is the ruler of a kingdom. In the national security concept, the word “king” used in this book depicts the one who is in charge of governance in a group. It could also be a government.

2.5 Security Under Change and Acculturation

The span of human existence is negligible compared to that of the world. History of humans in its macro-sense is invisibly downsized. Past is pronounced in the present in micro-history. Change is evident only after a reasonable period and not when it is on. This is important to understand change. Change is causative and is a function of time. Causality in philosophy is the relationship of a cause to its effect, as studied by Aristotle. The cause is defined, as the preceding event without which the event in question would not have occurred. There are philosophers like Henri Bergson (1859–1941)¹²⁸ who believed that the ultimate reality of life is not determined by exact causal consequences. According to him no exact repetition happens in real time, and where there is no repetition, there is no cause because cause means that the antecedents are repeatedly followed by the same consequence. But can there be cause without effect or vice versa in a meta-relationship between the two (Box 2.5)? Just for thought.

Box 2.5 Really, Can There Be a Cause Without Effect?

If a cause is the cause for an effect that becomes a cause in an unperceivable fraction of time (entropy change) for another effect of similar nature, in a never-ending system process, then can there be anything called an effect? If so, the argument of causality in philosophy stops short of the effect caused by it. But in a continuous system, especially the close looped one, which everything is as if in a never-ending domino, the effect doesn't ultimately end. If one imagines a never-ending system at cosmic level, there cannot be an effect as every effect turns to a cause for the next effect which is a cause. There are two options here: (1) causality theory is wrong and (2) if it is right there is no "never-ending" system. Look closely, (1) and (2) are neither contradictory nor in agreement. The causality theory is correct if it is falsifiable.¹²⁹ If falsifiability is acceptable, then a theory is right as long as it is falsifiable.

Chaos theory leads us to the simple principle of a system moving from order to disorder with the increase in entropy through bifurcations that leads one to another. Inevitably, there is chance that accounts for changes in bifurcations. In such cases change occurs. Small events like an assassin's bullet can change the course of history. And it is the same in cause and effect. Effect indicates change. Whatever may be the reasons, for the student of security, change is evident in a global context and is a sign to watch for. Another context to see change is through process

¹²⁸ French philosopher and writer. First to elaborate what it came to be called process philosophy. Process philosophy rejected static values for values of motion. Winner of 1927 Nobel Prize for literature.

¹²⁹ The theory is falsifiable if it is right. See Siddhartha Mukherjee. (2015). *The laws of medicine: field notes from an uncertain science*. TED Books. p. 51

philosophy. It is a speculative worldview, which asserts that basic reality is constantly in a process of flux and change. Indeed, reality is identified with pure process. Concepts like creativity, freedom, novelty, emergence and growth are fundamental explanatory categories for process philosophy. It emphasises dynamic being.¹³⁰ Through process philosophy, theologians bring out the sensitivity and caring relationship of god with the world. God is the original and accepted guarantor of security to humans.¹³¹ God too is in the process of change and development. India is a great place to observe god in its natural state as an instrument of perceived security. *Mariamman*, the goddess of smallpox, and *AIDS Amma*, the goddess of AIDS in India, are examples.

Whatever, with the tune of change, human concept of security vacillates between sensitivity and insensitivity to fear and anxiety. In Andhra Pradesh, India, there is a temple exclusively for guaranteeing visa, especially to the United States. According to believers, one who prays there is sure to get a visa to the United States! It is not sure whether the US president and the missions in India are aware of it. There are villages in India centred on spiritual belief systems with a focused identity of god responsible for their security. In the village of Shani Shingnapur in Maharashtra, India, the houses are without doors. The people do not feel the need to lock their houses. The village deity is responsible for their protection. Their god provides them safety. Here the relationship between the villager and their god is one of caring, and it works. It should, as long as there is no acculturation that may change it. There are other similar places in various locations in India.

In recent times there are reports that millions of people turned to god in the fear of the 2019 COVID pandemic.¹³² India's finance minister expressed COVID pandemic as an extraordinary "act of God" seriously impacting economy. Interestingly act of God is a legal term where the blame is subliminally attributed to god for an action that is done by humans in an effort to indemnify the failure of expected result.¹³³ How much it can indemnify the actor is for the subjects to decide. People turn to god when they are afraid, anxious, depressed, confused and when they feel the tunnel is blocked for exit into life they desire. For the natural people following religious culture, the perceived object of worship will be the fear inducer itself, whereas for the culturally religious people it will be a defined unitary god or no-god.

¹³⁰ Microsoft Encarta, 2001, CD-ROM

¹³¹ In this study, God shifts to the realm of quintessential spiritual security.

¹³³ "Covid an 'act of God,' may result in contraction of economy: Nirmala Sitharaman." <https://timesofindia.indiatimes.com/business/india-business/covid-an-act-of-god-may-result-in-contraction-of-economy-nirmala-sitharaman/articleshow/77786878.cms>. Accessed 30 September 2020. An act of God, as a legal term, is a natural hazard beyond human control for which no person can be held responsibility and, thereby, may amount to an exception to liability in contracts, or it may be an "insured peril" in an insurance policy. It excludes a human being. The question is can it be used to exclude a government which is an "entity" responsible to human well-being under psycho-social contracts with its citizens?

Continuous contact between two or more distinct societies causes cultural change. Through a process of selection and modification, societies assimilate the belief systems into a common one and thereby induce change. Anthropologists call it acculturation. Human security concept also undergoes change through acculturation, which is unavoidable in an advancing world. This explanation is necessary before straight jacketing the subject of national security.

2.6 Evolution of National Security

“Security” if separated from the compound word “national security” is about the primary human need by origin of human systems. The amplifying adjective “national” is a comparatively modern terminology. Its evolution can be charted from the Treaties of Westphalia through French Revolution to the present day. Signs are there that it will further transform. The term “national security” continued since then for all these periods interlaced with changes on its way to the present. It was not widely spoken till World War II. The term, by and large, was associated with “military security” for a considerable period. Even today, there is reluctance to dissociate it from this belief system. It is conditioned by centuries-old warring traditions. During the Cold War, the United States pursued its national security policy based on the containment policy of George Kennan¹³⁴ till the end of Cold War. Since then, the concern for non-military threats found a place in the security scenario.

Though the wide angle wheel over in the definition of national security began after the micronisation of the Soviet Union, there was isolated reference to the term as early as the 1790s. A group of Yale undergraduates debated the question whether national security depended on fostering domestic industries.¹³⁵ Martin Walker’s descriptive version of the Cold War¹³⁶ brings to the mind another question: Did the national security concept emerge from the dark abyss of the Cold War and the Freudian mindset of the totalitarian forces in a democracy, or earlier? If the proposition of the Yale University students in 1790 is acceptable, the original approach to

¹³⁵ Romm, J.J. (1993). *Defining national security—nonmilitary aspects*. Council of Foreign Relations Press. p. 2

¹³⁶ Walker, M. (1993). *The Cold War and the making of the modern world*. Vintage. According to the author, the Cold War has been the constant, implacable condition of the vast demographic wave of the children who were born, as the soldiers of World War II came home to a bitter and uncertain peace. It is poignantly focused history of a geostrategic style of 45 years in which the whole world participated directly or indirectly. Nobody was left out. For this reason, a researcher of national security can be misled to assume that the very concept of national security originated from the abyss of the Cold War. It was found not so.

national security was much earlier than the Cold War period. The Cold War was just another global conflict between two sides¹³⁷ that perhaps stressed the importance of deterrent military power in national security. Since then it became hard to conceive national security beyond military power, though the original concept had a much wider connotation.

The author relies in many parts on Joseph J. Romm's scholarly findings on the concept of national security, convincingly articulated in his book *Defining National Security: The Nonmilitary Aspects*. Romm traces the modern etymology of the phrase to the US Senate hearing in August 1945.¹³⁸ The then navy Secretary James Forrestal stated that national security could be assured on a very broad and comprehensive front and added that the word security was emphasised consistently and continuously rather than defence. He highlighted the broader concept of security compared to defence. Senator Edwin Johnson in his reply confirmed his appreciation for the terminology—national security. The emphasis here is on “words” used in plural, not “definition”. The term comprising the words was not defined then. Forrestal reemphasised that the concept of national security was not merely a question of the army and the navy. It comprised the whole potential for war, mining, industry, manpower, research and all the activities that went into normal civilian life.¹³⁹ Here there is an implied extension of the concept of national security beyond the military aspects—all the activities that go into the normal life of the people.

The phrase was in wider circulation by 1947 when the United States passed the National Security Act. The Act established, among other things, the National Security Council (NSC). The term was not defined but left flexible for wider use. It stated that “the function of the Council shall be to advise the president with respect to the integration of domestic, foreign and military policies relating to the national security. . . .”¹⁴⁰

Today, the nations face comparatively reduced threat from each other that enable them to address their domestic issues more comfortably. It is only an understanding at the moment. Nations still prepare their military outfits to face external threats, though most of them are used for quenching internal disturbances. The awareness is spreading over in spite of potential flash points that still exist in some parts of the world. The term national security is often mentioned in various forums today. The concept, therefore, calls for an appropriate definition. It is necessary to understand it and analyse it with the changing trends in human administration of the world nationally, regionally and globally.

The pursuit of nations to attain power is motivated by the survival instinct to influence global events in one's favour. This is a trend that is expected to continue. It is inherent in group behaviour. Barring military strength, balanced elements of

¹³⁹ Ibid. pp. 2-3

¹⁴⁰ Encyclopaedia Britannica, 2001. CD ROM

power will be used for that by each nation. It will be done in different ways. For some, it will be by ethnic methods and religious beliefs. For some others, it will be by accrual of strength through internal and external quality acquisition: healthy and competitive economy, leading edge technology, viable industrial capacity, quality education and international efforts through diplomacy. They will prefer a lean and lethal military to protect their national interests. More ideas may follow as humans keep evolving. The trend towards polarity will be evident in various deviations.

National security is a major concept that dictates decisions in the international playing field. The emerging international system today is independent of aspects that limit the freedom of action of states. Economic interdependence and heightened awareness of global effects of cultural, social and environmental challenges narrow down national perspectives further. This is the setting in which nation states shall ensure their security by maintaining national interests. For this, a clear understanding of its principles and evolving conceptual changes is necessary.

2.6.1 Role of State in National Security

In its outward appearance, the security of the people is the responsibility of the state. In its simplest terms, the role of the state is that of the role of the “king”. Adam Smith (1723–1790)¹⁴¹ conceived the role of the state in “atomic capitalism” in which every individual is considered to be the best judge of welfare. Social welfare was the sum total of the welfare of the individuals.¹⁴² According to Adam Smith, the functions of the state are as follows¹⁴³:

- (a) Defending from external aggression
- (b) Maintenance of law and order
- (c) Enforcement of sanctity of contract entered between different individuals for commercial transactions
- (d) Providing infrastructure, education and assistance to the poor

Adam Smith’s theory was based on highly atomic capitalism and was treated as one of state minimalism. In socialistic approach, privatisation was abolished to remove inequality between the haves and the have-nots. The state was given the role of acting as a vanguard of the people. This was to develop a new social order based on equality. Keynes¹⁴⁴ exposed the basic weakness of capitalism and called for an end of laissez faire. His statements were on economic security in macroeconomic conditions to maintain equilibrium. The role of the state was to promote

¹⁴¹ Scottish economist and philosopher

¹⁴³ Ibid. p. 211

¹⁴⁴ John Maynard Keynes (1883–1946) was an English economist, journalist and financier best known for his economic theory on the causes of prolonged unemployment.

public participation in economic welfare. But in an underdeveloped country, where one third of the population is below poverty line, changes in market mechanisms will make little change in welfare. The state has a major role in employment generation for the poor and promoting social welfare.¹⁴⁵

Kautilya augured ruthlessness against anti-socials, criminals and others not obeying the state. Gandhi¹⁴⁶ provided a touchstone: *Whenever you are in doubt, or when the self becomes too much with you, recall the face of the poorest and the weakest man whom you may have seen and ask for yourself if the step you are going to contemplate is going to be useful to him. Will he gain anything by it?*

According to the World Development Report, 1999–2000, “governments play a vital role in the development, but there is no simple set of rules that tells them what to do”.¹⁴⁷ Another vague area lies between the terms external security and internal security. These terms are often considered mutually exclusive. In India, according to author Verghese Koithara, the state and the influential public tend to view external security through a politico-military prism and not through an economic one. Internal security at the same time is considered state-centric.¹⁴⁸ Though these concepts are changing with the advent of militant activism, proxy wars and globalisation process, concern for human security is still expressed in abstract manner.

The Supreme Court of India had ruled that the government, having failed a licit promise, cannot claim impunity on doctrine of promissory estoppel and is bound by consideration of honesty and good faith. On the contrary, the government should be held at high degree of rectangular rectitude while dealing with the citizens.¹⁴⁹ The role of the state is flashed in this ruling.

All these are auditions in various social structures, ancient or modern. National security is not an end by itself. It is an approach goal. If that is the way it has to be seen, the role of the state irrespective of its basic structure is to go for it by measures that indicate the process status. This is done by defending the state, providing law and order, producing goods and services, regulating the system and a supplier of “public goods” such as education, health, infrastructure, drinking water, etc. In this role, the state has to understand that national security is a movement, not an end goal, and that needs the participation of the citizens who are the end beneficiaries.

A question that may linger on in the minds of analysts will be: “Who is responsible for national security?” The answer may be subjective in most of the cases. It is simple to analyse considering national security is about the total well-being of a people in a country and, therefore, the government vested with the authority and associated responsibility is accountable to the people for it, whatever

may be the nature of government. In a country, which is a formal group, obviously, the accountability is with the government. That was the role of the “king” identified in the early years in history by the strategists of the period. It is undoubtedly established that it is the government who has to provide for national security. People’s participation is the next interest. It is very much so in elected democratic countries because it is people’s rule, which also includes the opposition.

American sociologist Robert A Dahl has researched the reasons for apathy of the voters towards the potential system in the aftermath of the Great Depression (1929–1939).¹⁵⁰ His finding was inconclusive.¹⁵¹ There is no definite study on the behaviour of the people in their attitude towards national security and definition of a leader who is responsible for the governance of a nation towards it. But a society cannot manage without a leader. This requirement can be seen even in a small group in a biomodel.

There are two types of leadership in this context: the king or the governing elite (a body that replaces the king as a single entity). It is important to note that a king is slightly different from a leader of a group. The king invariably has official authority to lead. The masses elect the government in a democracy or accept the governing entity otherwise in a governmental system that is different from democracy. The idea is to find out who actually rules a country. Is it an individual, a group or a group under an individual? A team includes the politician, bureaucracy, military and the corporate houses and others who have the power to be insiders. Each one of them knows their subjects well and is equally ignorant about the subjects of others. Hence, there is the requirement of a body to govern, naturally. Everyone else who has the power to counter this conglomeration of governing bodies is within the anteforce that slow down progress or maintain checks to balance the system. From the point of checks and balances, it can be visualised that the anteforce to a certain degree is a necessity. Strictly these things do not matter seriously in national security because of its dynamism attributable to absence of static inertia since the world is time bound for development and progress in the path of evolution. But a storm in a tea cup is a big thing for an ant that slipped inside.

Ultimately the questions remain:

- What is national security?
- Who actually governs national security?
- How they have to govern?
- How they govern?

There is no standard model to answer these questions. But models can be created or identified. The models should be truthful to the context. There is one more challenging question that needs to be considered while looking for the model: “Is

¹⁵⁰The Great Depression was the economic slump in North America and Europe and other industrialised areas in 1929. It lasted ten years. It was the worst and the longest ever depression in the industrialised world.

¹⁵¹Panigrahi, D. *Afternoon Dispatch and Courier*, New Delhi, 17 September 2004, p. 2.

national security independent of the form of government?” It is not difficult to answer. Whatever may be the form of government, it is the well-being of the people that matters ultimately. How it has been achieved is left to the nations even with identical forms of government. It is also not necessary that one form of government is more suitable for improving the national security index than the other. But it could be said that the general approach is based on the standards of democracy since constitutionally it stands for freedom. A democracy is the ideal ground for development of national security. Democracy provides freedom. According to Ashley Montague (1905–1999),¹⁵² “To be free of bondage or restraint, to live under a government based on the consent of the citizens, these are the basic among all the freedoms. . . and this is the reason why a democracy is from every possible humane point of view the best form of government. . . what so many human beings failed to understand is that freedom is the greatest of all trusts”.¹⁵³ But freedom is not national security; it is a fertile field to cultivate national security.

2.7 Descriptive Stasis of National Security

Much has been mentioned about the concept of security. Security has been the single most concern of humans all the time. The anxiety induced by insecurity leads a human to live life till the end. In other words this anxiety is the prime mover of survival for the emperor as well as the subject in the human system. It is applicable to all living things, but for this study, though primordially carried forward, security is about the churning in the mental faculty of humans leading to intelligent and logical solutions for the next move in life for survival. Only humans can reflect the next move logically to overcome insecurity. The bottom line is that without the feeling of insecurity, humans will not be able to apply their intellect, the survival tool, to survive life intelligently. Humans being social beings can use it collectively through governance of their choice.

Scholars have defined security and insecurity in many different ways to explain the descriptive stasis of the term based on their fields of study—clinical, normative applications, law enforcement, psychological, sociological and so on.¹⁵⁴ But still there is a vacuum in the definition of security and insecurity, more so in the application of the concept with respect to national and global governance. Adler’s finding of perceived security is already mentioned. American sociologist William Isaac Thomas (1863–1947) had identified empirical methods along with his Polish contemporary Florian Znaniecki (1882–1958). Thomas contributed to the sociology of immigration. The sociology of immigration, particularly in its ethnic and

¹⁵² British-American anthropologist

¹⁵⁴ Cameroon, W.B. and McCormick, T.C. *American Journal of Sociology*. Vol 59. No.6 (May, 1954). pp. 556-64. <https://www.jstor.org/stable/2772598>. Accessed 13 December 2019

determined format of filing up as a strategy, is an important national security issue for many nations today. Immigration is driven by insecurity. This creates issues in national security especially in the elements of demographic security and ethnic security. Within the religious polarity, forced and determined immigration is a strategy for control of power in the long run.

The psychological study of security and insecurity in the national security parlance is seen from the point of view of well-being. Neither Adler nor Thomas had studied them from the point of view of governance. While there is much talk on governance and national security in the bureaucratic and associated circles, the exact nature or notions of security and insecurity with respect to a sample human system is absent in such discussions. People feel insecurity; governments may not feel it that way as there are no metrics to measure it or sensory perceptions to feel it in governance.

This study looks at security through various approaches, all related to governance, leading to national governance and concludes it as the most essential human requirement or survival. The feeling of insecurity is very different from the feelings of inferiority or inadequacy. Insecurity is an emotional aspect, or rather a state of mind that follows one by birth. It is established early in mind. Feeling of insecurity upsets the existential progress of humans if not concluded positively. The government can attempt to provide for insecurity and avoid totally or minimise the insecurity dilemma by creating a situation of well-being in the apparent security mode, and the individuals and groups attempt to provide for the balance to fulfil the perceived security mode. Security or well-being is not a final product but a process objective. It is a continuous function that requires governance and not a one-step home delivery.

In this study security and insecurity are continuously examined from the governance point of view where governance is looking at the stasis of a human system and thrive to provide maximum apparent security to the population beyond the borders of limitations. It is an activity that never ends to stop, relax and relook. National security this way is the well-being of the people, the perpetual goal of governance by action.

2.8 Summation

Security is the primary concern of human beings. It is seen in their actions in life. This is depicted through various means since the beginning and constantly through the mimesis of evolution. It is a concept that changes with respect to changes in evolution around a basic core that remains invariant. Human beings were never static in one place and cannot be expected to be so in future. Today, the land on Earth is sold out all over the world and the human beings have graduated to societies that live in nation states. Any land which anybody has to own anew has to be transferred from either government or private owners. There are also individual humans who already

claim land properties in the moon through online lunar realtors.¹⁵⁵ Insecurity in perceived form matters here.

People are generally proud of their countries that they call home and will not leave them except under compelling circumstances. Security is the main concern for humans, and it goes beyond physical security in the modern world. It is a matter of needs and wants. Humans carry their aspirations bordered around security. The aspirations can be inflated; most of the time they are. When not achieved, people rely on spiritual security activities concomitantly. National security and spiritual security go concurrently with creativity. Human race moves forward in this churning globule contented with self-rationalisation.

This aspect is converted into national security post-nation states. The name is new, but the concept is old. Its evolution can be traced from the security of human systems in the world since the time such systems realised their weaknesses compared to other life forms. The state and its government under the concept of the “king” or the “ruler” are accountable for providing the people the minimum required security—the apparent security. This they do by making laws and submitting to them under the principles of rule of law.

Governments are aware of the concept of national security extending beyond military matters. The non-military aspects of national security were getting recognised in a serious manner in the nearby past.¹⁵⁶ But it is time the nations consider the entire concept as national security without separating the military and non-military aspects. This is especially so with respect to the inclusivity of elements and specificity of terrains on which every government will have to plan and execute national security governance.

The idea of national security as identified in this study can benefit the entire humanity by governance. In this study the subject has been approached in 11 different ways. The approach begins with the needs of human and ends with the developed scenario when the world is wobblingly stable on binary bipolarity. The wobbling is not because of the binary polarity of power and belief system axes. Both are survival needs of the life form that can think—the humans. Hence such polarity should be natural. But surviving within the wobbly world can be done easily by good governance. And good governance is when the well-being of the people becomes the end objective to those who govern.

¹⁵⁵There is nothing that expressly forbids bidders from owning land on the moon and other stellar bodies—planet, dwarf planets, satellites and so on. Any documentation that claims such property rights is unenforceable. The nations that are associated with outer space or any stellar body will not agree and recognise such space ownership rights. But the fact is this is the first time sapien claim property rights on a surface that they have not migrated to. Humans are extending beyond reach and establishing is a sign of perpetuity of sapien life at least in thought.

¹⁵⁶Strictly, the expression “non-military” aspects of national security is incorrect according to this study. There is only national security, not military and non-military securities as standalone concepts. Military security is an element among the 16 identified elements (Chap. 6) of national security that needs to be optimised along with other terrains specifically for national security.

Chapter 3

National Security: Definitions and Manifestations

National security is about the sustainable well-being of a nation and its people, including their physical security

3.1 Introduction

“National security overrides all other considerations”¹ was a statement quoted of Atal Bihari Vajpayee (1924–2018), the then prime minister of India, often cited the world’s largest democracy². He was addressing the Indian Army. The title talked

¹“Agencies, Pull Up Your Socks: PM Tells the Army.” *Sunday Mid-Day*. Mumbai. 17 March 2001, p. 1.

²As seen earlier in this study, democracy is all form of governance through an agent as a government. But in this statement, democracy is used as the usual expression of electoral government. Such contradiction may be seen elsewhere also for better appreciation of the reader.

about the prime minister asking the personnel to “pull up their socks”. It was clearly not about socks or sock diplomacy³. It sounded more a media fancy under excited journalism. This study looks at the usage of the term “national security”. The term reported was seemingly different from the national security being examined here. The mediaspeak was about military security, in other words, physical security that a nation’s armed forces have to ensure. Even then what the prime minister said is appreciable: undoubtedly, “national security overrides all other considerations” in national governance. It is the prime concern of a government. Therefore, understanding the term is important before defining it relevant to national governance.

“It’s the economy, stupid”.⁴ The quote came from another statesman—William Jefferson Clinton, the then president of the United States, world’s oldest democracy, as often mentioned. This was coined by James Carville, Clinton’s political strategist, during the election campaign in 1992. The real phrase was “the economy stupid”. It was rendered speciously. There were two more messages that Clinton approved in his campaign: “Change vs. more of the same” and “Don’t forget health care”, both related to governance. Clinton wanted to highlight the prevailing recession in the United States, healthcare apprehensions, and the need for reforms to sway voters in election predicament to defeat George H. W. Bush. The message “change vs. more of the same” invokes the law of invariance mentioned in this study. Largely the messages that come from serious and responsible politicians are all about governance. While Vajpayee was eloquent on military security, Clinton brought out economic security and health security. Analysis of various such sayings from those in charge will project national security and its elements for human well-being. The question is, “What then ultimately is national security?” At the moment it can be stated in a lighter vein using the phrase of convenience as the “mother-of-all”⁵ security perceptions.

National security, as an expression, evokes a great deal of interest and invites varying interpretations. Deliberations, considerations, opinions and cogitations go on endlessly. The concept varies in individual perception within not only a nation state but also among the nations themselves. Whatever may be the settings against which the term is framed, the unifying factor is that it is the people of a nation who matter in national security. Appreciation of national security and nature of governance can make or break them. There are no failed or rogue nations. There will only

³“Pull up socks” and the more fashionable “sock diplomacy” in that genre are common media terms. The latter is more recent. See Friedman, Vanessa. “Justin Trudeau’s Sock Diplomacy.” *Fashion, The New York Times*. 27 June 2017. <https://www.nytimes.com/2017/06/27/fashion/socks-justin-trudeau-canada.html>. Accessed 14 September 2017. Sock diplomacy is a media literary statement with a political message of how politicians play calculated games through fashion statements. Pull up your socks is an authority-backed informal admonition.

⁴Bill Clinton, during his second election campaign for the office of the president of the United States. Also title of Chapter 18 of the Book by James Adams on the next world war. Adams, J. (1999). *The Next World War*. Arrow, p. 307.

⁵This phrase of convenience is attributed to the former president of Iraq Saddam Hussein (1937–2006).

be failed or rogue governments and people behind the haplessness of any human system. In this statement, the nation is detached from people as a separate entity similar to a corporation being a separate citizen.

In strategic thinking, a term has to be defined precisely. A concept will be abstract when it is not defined, worse when defined incorrectly. National security is one such concept. It reflects in the quote of Confucius (551–479 BC), “The beginning of wisdom is calling things by their right name”.⁶ If not understood correctly, an apple can turn out to be an orange when least expected.

Defining national security is important to understand the concept in its clear perspective as well as furthering research into its dynamically evolving constitution. It is important in security-centred nation-building. If not understood, planning will be misdirected and costly; target selection will be injudicious. Incorrect policies and deviations can cause strategic blunders destructive to mission objectives. A well-defined concept with identified elements can overcome such impairments in policymaking.

There are many limitations in defining national security. One of them is its evolutionary nature. The concept can transform continuously based on the human perception in governance. The perception can change when conditions that affect them change. For example, demographic density is one of the conditions. It is increasing continuously inducing silent stress among people. It doesn't stop or decrease as the world is getting crowded every moment. It can be compared with the panic expressed by the passengers of a ship that is shipping in water. When the ingress of water is more than what is being bailed out, passengers go through a kind of “sinking feeling”.⁷ Only that the sinking feeling is not immediately visible in demographic spread. Such changes, if not governed properly, will make humans to redraw their system boundaries causing micronisation of nations. The axes of polarities change under such situation, especially the religious one.⁸ This happens with the ingress of population—by birth and migratory relocation or human trafficking. The nation can “sink” if the ingress is more than its reserve demographic buoyancy (Chap. 13). There are many such factors in national security assessments that are limited to predictability. Accordingly, the definition of national security, being evolutionary, also can undergo changes unless a universal definition is identified. In this study, human well-being is taken as target affirmation for identifying a quantum definition. This will help in exploring limitations in defining the term.

⁶Indian Navy. (1999), *A primer on information warfare* (Unclassified), Naval Publication 6001.1. Naval Headquarters. p. 20.

⁷There can also be mounting feeling when population increases in a system that promotes it. Normally such systems are smaller than a nation.

⁸The finding here is that the overall human systems dynamically move about the two bipolar axes, one based on political power and the other belief system power primarily based on faith with two prominent nations representing each at the polarities at any time. The assumption behind this finding is that a monopolar world is neither possible nor balanced in any which way. All other nations floatingly align with the two axes for the purpose related to them at different points moving all the time.

3.2 Limitations in Defining National Security

It is not ideally possible to define national security to conclude universally because of imposed and natural limitations. In any such attempt, in an evolutionary scenario, the consistent method inertia⁹ (Box 3.1) needs to be traversed. Method inertia catches up more seriously in an evolutionary system. The method inertia is also one of the contributors to the law of invariance. The alterations are resisted by past practices. Definitions of national security will always reflect the perceptions of the past. The dissonance in perceptions will echo in policy decisions and affect governance.

Box 3.1 What is Method Inertia?

Method inertia is the resistance caused to forward momentum of an individual or a social human system including a nation by the methods practiced in the system, where method is a practice or any such activity initiated for a purpose but continues even after the purpose is achieved. Method inertia exists in most of the formal human systems: families, educational institutions, religious organisations, business corporations, nations. . . Individuals are also not free from method inertia based on belief system. Method inertia can constrain progress and stifle governance.

Changing the mindset of people including those who govern is important under such circumstances. It is a difficult task. Such are the limitations. They resist straight-line approaches in decision-making in national security governance as a function of time. National security is not about the wants and fancies of the people, perceived security, but about the reality needs of the people for survival, apparent security. Of course, they cannot be differentiated in this manner. It is mentioned only for appetising clarity. There can be needs in wants and vice versa. They have to be fine-tuned by governance. Both are equally important. Ideally, a government cannot provide for perceived wants of people. People have to prospect and gather it on their own as they appreciate. Governance can set the environment for that or cautiously avoid causing constraints to such environments already there. It may also call for rule of law. An example is freedom of religion and taking measures to avoid coerciveness in the name of religion such as preventing forced religious conversions or honour killings that exist in many human systems. They will be always engaged in it. Apparent security will be felt insufficient, but that is only what the government can give, that too, a responsible one, within its limitations. But the government cannot neglect perceived security. But the fact remains that security as perceived by the people is not what the government can attempt to give even under flawless governance, because it is always more than apparent security, more than what people

⁹Method inertia is a major no-giver in a human activity. It constrains governance.

need. People look for perceived security beyond apparent security. They normally take apparent security as granted, though it is not so. The law of invariance coupled with the law of limitations remains a hangover in governance even in apparent security maximisation. The law of limitations states limitations are natural in any activity. This is further elaborated later. The government is accountable for total security as national security. That is where the remaining part is filled with spiritual security supported in governance. That is where the people govern themselves through the government. This also speaks for governance by the people through elected governments for now or a better system in the future which is yet to be developed (YTBD).

3.2.1 Law of Limitations

The law of limitations in human lives will be defogged when people are seen as productive beings. The productivity of a human is more in investment format than as a resource. Humans are dignified life forms that use resources in any productive activity. They are not resources. They use resources to produce a value-added output. This is the basic approach the author recommended in his studies in human investment management (HIM).¹⁰ The study on national security is not concerned with HIM except where it endorses the limitation factor—survival limitation. It originates from the fact that any living being is endowed with “only” what it needs for survival, not what it wants while surviving. But humans have a choice—fantasise and enjoy perceived security as if in a real scenario. That is when super human characters and associated behaviour patterns take shape to do what humans otherwise cannot, rather, need not.

In fact, no living thing will be endowed with more than what it needs for life to carry on, not to carry on with life as perceived. This will be easily understood if one tilts the angle of appreciation to the reverse process—life survives on the planet because the planet is conducive to it. Therefore, life specific to a living thing will be limited to the essentials of sustaining its life which may also cater for evolution in an appropriate sense. This is something similar to what human resource management call career planning of employees without doing much about it. It picks up in its natural pace.

Law of limitations in national security studies is different from the limitations in law. They are subject to the needs of life. In this process human systems are no different from other life forms. “Limitations in law” prohibit executing certain legal procedure, such as of time for different suits, liability for different acts, jurisdiction for different application and so on, under the existing laws. Limitations in an activity in human scenario percolate into the natural aspects of life sustenance including

¹⁰Paleri, P. (2018). *Human investment management: raise the level by capitalising human*. Springer Nature Singapore Pte Ltd.

induced legal and non-legal limitations. Therefore, the law of limitations in national security studies can be defined “as those limitations that are naturally set in human lives within the apparent security syndrome that limits the needs from the wants”. “I want to fly; but I don’t need to fly to survive”, hence limited in capacity but intellectually developed to invent a vehicle to fly at the time appropriate within the rhythm of life. Till then (of course, even after), one can fantasise on super humans or dream physically taking off in the cerebral sense of a dream while sleeping.¹¹ This prevents the human needs from crossing the limiting lines of needs except through evolution along the drawn out process which also explains the existence of law of invariance.

Law of limitations can thus be redefined as “the law of nature that prohibits move by living things to overtake the process of evolutionary frequency¹² by intellectual or other superior moves except where such moves are made within the natural rhythm of process subject to the law of invariance”.

Law of invariance does not block alterations. Similarly law of limitations does not limit an activity if it is within the law of invariance. Complicated? Yes, but doesn’t matter. Look at a scenario. A relatively powerful country may like to engage in real-time war to test the new weapons with collateral interests of exclusive economic and strategic benefit. It may find logical reasons to do so. Such “logical reasons” logically may be acceptable to the rest of the community in the global human system. But generally it will not be easy to make them accept the reasons however logically correct they may be. It becomes an illogical adventurism (a phrase of convenience). The logical reason under the illogical adventurism will be limited under the law of limitations in such case. Public resentment in most of the war escapades come from the law of limitations. Law of limitations is present everywhere in human life and therefore extended to governance naturally. It is necessary to guide and retain the rhythm of growth. Governance of any form has to overcome such limitations under due consideration. Therefore, it is important to understand them and their effects in the involved activity.

Law of limitations is also affected by the uncertainty aspect. Factors that govern uncertainty are much more serious and uncontrollable. This will be examined in a separate chapter. The basic crux of uncertainty that impacts decision-making compounded by the law of limitations is the focus shift and its effects. The more one focuses on a particular element of the chain of elements in an activity, another element may behave unpredictably elsewhere. This can be seen in daily life. This law has a lot to do with chance. These are practical issues in decision-making. Many parents will experience uncertainty and chance-induced deviations when they find

¹¹ According to the author, dreams are “mind sweat” that clean up the cerebral sensors and memory caches off accumulated wastes of thoughts and closed up feelings of limitations while the entire body is laundered during sleep. Seemingly it happens in a short or long time shift vis-à-vis cellular cleaning of the systems of the physical body. The law of limitations is the way humans get disturbed by them; hence fantasies and dreams.

¹² Evolutionary frequency is a term used similar to the natural frequency of a system in vibration engineering (denoted by the Greek letter omega: “ ω ”).

their wards are not turning out the way they wanted in spite of them choosing their institutions of study and other activities in a “focused” manner. Too much attention to the institution may take the attention away from the child somewhere. The result will be clear much later. A country finds its top general killed by a startling drone fire in spite of being on a diplomatic mission. Its pride and hold over its people remain shattered. It needs to do something to regain them. War is the only option even though it lacks the necessary strength to reach and hit the rival. The scenario turns wild hunting between two binary polarities—power of politics and belief system. They are almost there on the event horizon of aggression, come what may. Unexpectedly someone in control in its armed forces shoots down a passenger plane while taking off killing all passengers on ascend. The country faces more trouble domestically. This is the chance theory based on uncertainty. Both the countries find excuses to call off the shots and agree to continue with warmongering diatribes as before. Laws of limitations coupled with the law of invariance (Box 3.2) can create havoc in national planning and its implementation especially when they are not compatible with the rhythm of natural advancement even if destructive. It will be worse and more turbulent under assured uncertainty and chance. Destruction is a relative term. For nature, destruction is part of construction. Any criminal knows how difficult it is to commit a crime!

Box 3.2 Law of Invariance (LoI) and Law of Limitations (LoL)—The Game of Zero to Infinity

Nowhere one could define the LoI and LoL better than in calculus which for the author is a kind of suspended mathematical animation. Numbers hang between zero and infinity (∞) where the former is a number but the latter is not. Infinity is a concept. $0!$ is there, but there is no factorial for infinity ($\infty!$ is impossible). $0!$ is one, and so is $1!$ Are they strange bedfellows in maths? There are more normal abnormalities at the end of mathematical telomeres comprising zero at one end and infinity at the other. But they are acceptable and proven fine. But, observed separately with a mathematical cocked hat, they don't meet the ends as identical figures in the zero to infinity paradigm of human intellect. In differential calculus invariance appears as d_x , and in integral calculus limitations are defined by the zero to infinity integral. The integral pathway of zero to infinity is applicable to national security, not because the concept starts with zero but it ends in infinity which is endless.

[Brahmagupta (558–668), who is said to have invented zero, was not aware of calculus, but indirectly helped it to be invented by Isaac Newton (1643–1727) and Gottfried Wilhelm Leibniz (1646–1716) by the time John Wallis (1616–1703) concluded on infinity in 1655].¹³

¹³ This explanation needs further research. The ideas of zero and infinity are used to explain the LoL and the in-between LoI in the world of mathematics where humans spend a lot of time in a life that is absolutely functional to the time.

3.3 National Security

This study espouses national security as a concept that is applicable since humans decided to live in organised systems of different kinds. That was thousands of years back. People were people even then. They were afraid and felt anxiety associated with fear and insecurity as their descendants feel today, though for different reasons. The functional and structural seriousness of the organised system are not very relevant. It is about what comprises the system—the sapiens. In any kind of human system, there should have been governance by consent, acceptance, opposition, coercion or any other nature. The prime areas of focus naturally would have been protection from external threats including that of wild animals and also for foodstuff whether it was by scavenging, gathering or farming and distribution. Important here is that all these methods of food security for the group are not seen as one leading to another for the same reason. They became prominent in that order as humans advanced. But they still exist in the modern human system of the twenty-first century as a sign of the law of invariance that is as clear as the shadow in sunlight.

Scavenging among humans is the closest transitional behaviour pattern from animal kingdom. Animals don't sow; they don't reap (well, directly and knowingly). They prey on or scavenge. Scavenging also tidies up the environment and balances the ecosystem. Scavenging is herbivorous as well as carnivorous. In the sense of food, it means searching for and collecting from discarded waste or by overpowering the original claimants. It is not just feeding on carrion in the carnivore's sense. Humans remained collective against predators including their own kind. They scavenged for food in the beginning; mostly continuing in the collective sense. The smallest collective was the buddy system. People still follow it when they go shopping or outing. Where is the change? Scavenging turned into gathering by hunting or otherwise. Buddy system continued. The interesting aspect here is that gathering did not replace scavenging completely. Amazingly even today there are humans who scavenge. This is an interesting aspect of evolution. Evolution need not replace the previous format. It has to lap dissolve through ever continuing time into the next or continues on its track and evolves further with respect to time.

On the reverse of this kind of streaming is also a sign that the concept related to it is evolutionary. The evolution of hunter gatherers to farmers and distributors happened in the same evolutionary manner. There was no gap or time gorge between the advanced one and the replaced one. They just streamed out into the new from the old with the old continuing and further streaming. Physical protection and food thus lead other security paradigms in human life since it all began. From here one could start looking for a definition of "national security", a word that came to the fore, thousands of years later for what has been happening since the biped started visualising the future. This find is under the assumption that there was some kind of governance in every human system. The need for governance is appreciated from the fact that humans are social species and are not isolated self-imbibed individuals. Their physical, mental and emotional survival heavily relies on mutual interaction.

The world always remained premeditated with war and conflicts. National security though unnamed in the beginning continued to be connected with the military and armed combats. Victory in war guaranteed security. Under such mindset humans could not think of anything else other than war for preoccupation and self-assurance. Wars became addictive to the powerful. But it is interesting for a researcher to find out that there were scholars who recognised the enlarged idea of national security in the midst of war and mayhem. This has been mentioned in the previous chapter quoting Joseph J. Romm's statement on Yale University undergraduates.¹⁴ From this point on, national security is mentioned as the name of the concept on the human system perception of, can it be said, existential security? Provisionally the concept diluted its preoccupation with expressionism related to war. Still war was the underlying concern. It was too early to appreciate other areas of national security.

Wars were the preoccupation of humans in a world that was footloose and suffering. Does it continue today? Wars occurred throughout these epochs at regular intervals. Some of them lasted for unusually long periods.

Competitive war efforts advance science and technology. The psychology of invention is rooted in destruction. The antithesis of construction or, rather, creation became destruction under the sapient intellect that remained hunting like a gyro pointer seeking the unknown and strange. Intellectual ability was not telescoped towards secured human life for all, but self and selective lots. If not, there wouldn't have been so many narratives from all and sundry on how to live peacefully. The unseen peace became a word in all lexicons and remained in the context of words that could not be defined. Peace is considered to be an all-is-well situation endowed with calm and tranquillity. It is an impossible and improbable abstractive state. Peace triggers utopian stasis. Human chase for security leads to many such abstractions. Another definition for peace is a time period when there is no war which also can be used to depict the state when a war is ended. The antonym of war in both cases is not peace. Peace is an imaginary state. Wars and conflicts never end. It gets a stopover when both sides cannot engage anymore and needs a breather. That's called "ceasefire", mainly meant to equip the parties for the next round of conflict now or later in battle fatigue or otherwise.

Ceasefire is an interesting combat behaviour since ancient times. It happens only in war in human interaction. No, it doesn't happen as a prelude to divorce between fighting couples. Sometimes the stopover in war between nations is under the practice of ethical warfare. But the fact remains war is perennial. It also means war includes conflicts of every kind between human systems. Hence, war and other-than-war situations prevail all the time. This study doesn't intend to use the word peace as it conveys a semantic aberration in appreciating the situations. There is also a kind of semantic deception in using the term peace. No one really understands peace. That's why a UN peacekeeping operation turns out to be a warring operation against those

¹⁴Romm, J.J. (1993). *Defining national security—nonmilitary aspects*. Council of Foreign Relations Press. p. 2. Also see Chap. 2.

in combat or gazing observation game at heavy cost and turns the UN Charter insufficient to handle the scenario.

There is an irony of sorts when one has to fight a war or clash with another system engaging in destruction in the hope of feeling secure. Human intellect developed constantly, directed towards destruction. National security was closely associated with this intellect and thereby a concept meant for defending a nation from external aggression. It is yet to gain momentum in a wider facet. Even today, national security relates to military aspects. Therefore, defining national security as a concept beyond defending a nation from external aggression and related internal disturbances may not be acknowledged. Fear of unfavourable reception should not be a criterion for abandoning an attempt in finding truth from facts. In this study the attempt originates from the earnest conviction that the centre of gravity of the concept of national security lies outside the military aspects of national defence or aggressive combats for envisaged gains and spoils.¹⁵ It is showing today. To defeat the enemy today and in the future, one may have to hit not at the military centre of gravity, but outside it where the heart of the dragon beats. This is the best one can say to get the governments out of the military fad of national security. People will be people, expecting them to be different is gratuitous. If that is so, every victory gained by destroying the centre of gravity of national security of the rival could be pyrrhic because the winner will also be affected, sometimes more than the other. It is an impossible state otherwise, mentioned only to drive home the point that the concept of national security and the way towards it are extremely complex. It is not about military. Governments should know.

3.3.1 *Defining National Security*

Defining national security for universal acceptance is a challenge. All the existing definitions of the concept project its significance and relevance in relation to national policy. They are appropriate to the situation though seemingly not in consonance with the developments of the world. An attempt to define the concept, therefore, may not be the end by itself as situation can drastically change in the future. Reaching out for a definition involves careful examination of many applicable factors.

There are scholars and authors who argue that the term “national security” has been overstretched to fit into the context. Most of them call for the distinct need to define or redefine national security.¹⁶ Some studies show that national security was centred on military security only till about World War II and earlier decades of the Cold War.¹⁷ Thereafter, there is a visible shift in thinking, though wars are still

¹⁵Paleri, P. (2002). “The concept of national security and a maritime model for India.” *Doctoral dissertation*, Department of defence and strategic studies, University of Madras, India.

¹⁶Saighal, V. (2000). *Restructuring South Asian security*. Manas Publications. p. 36.

¹⁷Ibid. p.36.

critical to a nation's security. Various authors identified national security with a host of variables and unknowns in an effort to model it. Some devised periods as variables that changed the concept of national security in the path of its evolution. The parameters included military power, economic conditions, global alliances, support from international organisations, etc. The periods identified were that of the world wars, Cold War and other factors that affected global stability.¹⁸ The recipes varied in relation to space (geographical location), time (whether there was stability in the region during the period), attitudes of superpowers¹⁹ towards the countries concerned, hostility of neighbours (or otherwise), the internal security situation, economic vulnerability, social equilibrium and a host of other factors.²⁰ Defining the concept has to be seen against these backgrounds and beyond. The existing definitions, occasions of usage, collective acceptance of the term, activities related to the execution and governance of national security, ongoing debates and, above all, the objectives and the ultimate goal of national security need to be examined. In an exploratory mode, it is best achieved by examining the definitions of the concept evolved over the period.

3.3.2 *Timelining Definitions*

The search for definitions of national security will do well if aligned with the exploration of the evolution of human systems. To understand the perceived meaning of national security, it is necessary to sift through the existing and now discarded terminologies, expressions and analogies. The perceived meaning needs to be refined to get to the actual meaning, especially when strategists and planners feel the concept is not clearly defined. The changing definitions can be analysed on a timeline. Since the idea is to examine the changes in the factorial parameters of the term "national security", the timeline as such matters only to refer to the period if someone is interested in studying the reasons for such changes. The present objective is to define the term "national security". Before that it is imperative to examine the random timeline of the evolution of the concept.

The random timeline is selected in global perspective without looking deep into the communist ideology originated in the nineteenth century. An ideology is not a concept though outwardly it may look so. National security is not an ideology but a concept. An ideology has a half-life, whereas a concept evolves continuously. The ideology views the national process dogmatically though the ultimate objective is

¹⁸Ibid. p.37.

¹⁹The usage of the word "superpower" hints at the national polarity based on power to influence the rest of the world. The study of national security aims at the usage of the word superstate (seen later), the state whose national security index (mentioned later) is maximised or nearly maximised sustainably and as required for the polar balance. Also see Chap. 2, Note 114.

²⁰Saighal, V. (2000). *Restructuring South Asian security*. Manas Publications. pp. 37–39.

well-being of the people through the state. The communist ideology has undergone substantial metamorphosis in parts. There is also reserve ambiguity with respect to its axial polarisation. It is a binary ideology by itself where it can be a political system or a religious system (where god is no god believed in private as god or gods) with respect to the angle it is viewed. However, national security evolution in terms of communist ideology can be better visualised within the context instead of global. The timeline here, therefore, is an appreciation of the periods of the changing evolution of the idea within the global human system as an evolution where temporary bifurcations such as communist ideology are not considered. The timeline phase derivation is in the format of data pockets that could be used for preparing an inkblot spread to model the evolutionary spread of the changing concept of national security. There could be other phases also with respect to each nation for a detailed analysis if required. The timeline identified here is considered sufficient for explaining the evolution of the concept of national security in this study. They are examined below.

3.3.2.1 Pre-1790. Physical Security

National security concept existed pre-1790 as the concept of sovereign state had already taken root theoretically in 1648. But military security remained the concern of human system as it was before in terms of physical security. The concept was deep-seated in the singular aspect and concern of military security to decide on what was mentioned as “peaceful period”.

3.3.2.2 1790. Yale University on Fostering Industries

Perhaps the earliest branching out of the topic with a name happened in 1790 when the undergraduates of Yale University debated whether national security depended on fostering domestic industries. The term national security was mentioned here, perhaps, formally for the first time. The Industrial Revolution (1760–1840) was on. The subject of management was yet to be born.²¹ The baby boomers of the period were in their prime youth. Obviously the world was looking much better and positive to them than their predecessors. The intellectual thinking streamed to positivity of

²¹The first master of business administration programme was started by the Harvard Business School, in the United States in 1908. A year later in 1909, Fredrick Winslow Taylor (1856–1915) an American mechanical engineer published his book titled “*The Principle of Scientific Management*” that mentioned simplification of process can lead to increased productivity. The Yale idea of national security leads the idea of management by a century plus. If national security is governance, then it precedes the idea of management during the period of Industrial Revolution itself, whereas management originated from the competition created by the Industrial Revolution in production and manufacturing based on the rush of inventions.

well-being with the Industrial Revolution pointing to the way ahead at the end of the eighteenth century.

The statement of the undergraduates points out that the concept was originated in the United States which was very much poised and determined to become a superpower as early as it was born, as commonly accepted, on 4 July 1776. The thought process was unique and progressive. The statement of the Yale students was revolutionary considering the migrant country, the early European model of sovereign state, was just 14 years old on its track by then. The country had the early nation and exclusive settlement advantages. It never looked back since then. But there is much to the United States as a model for national security studies than mere geopolitical discernment.²² The Yale university students' argumentation was to extend the concept of national security to industrial promotion. This came out of the realisation of improving the quality of life taking advantage of the newly found game changer through industrial production based on the technological inventions around the period. The statement linked national security with domestic industries. Quality life (well-being) and economic security reflect in it. Though not defined categorically, there was clarity in the perception of national security.

3.3.2.3 1914–1918–1939–1945. Global Wars and Interfacial Period— Fixation on War and Collapse of Governance

The 31 years between World War I and the end of World War II was an interesting period in understanding the inertia of the national security concept though every period or epoch in human systems has always had something to highlight in governance. There was not much headway in matters “national security”. It remained where it was—obsessed with military security. The world was stunned as if it was in a temporary amnesia with the goings-on. Human systems were turned topsy-turvy with the windows to clear and forward thinking firmly shut. But the world kept moving forward in the momentum created by inventions, industrialisation and the acerbic edge of war itself. This period occupies one of the many knowledge bases in human history that is not lost to time, but has not been examined deeply. The search will show that the concept of national security throughout the period was based on the fear and fixation of war except for a brief moment when American author Walter Lippmann (1889–1974) briefly posed a counter that national security is not war but a concept through which a nation can

²²One of them is the question of its singularity as a sovereign nation. See Collin Woodard. “Forget the 50 States; The U.S. Is Really 11 Nations.” <https://www.npr.org/2013/11/11/244527860/forget-the-50-states-u-s-is-really-11-nations-says-author>. Accessed 21 January 2020. The author concludes that for hundreds of years, America has been known as the United States of America. But the country is neither united nor made up of 50 states. His research showed America is really made up of 11 different nations. He researched American voting patterns, demographics and public opinion polls going back to the days of the first settlers. Does this mean the nation is in reality United Nations of America? Are their similar (united) nations elsewhere?

gain its needs without war. It was a tacit appreciation of war in the middle of hostilities and combat scenario against the idea of (national) security. Lippmann poked the bubble rooted in the belief system that war was the only means for nations (read rulers of nations) to have what they wanted. This mindset of governance still persists and is expected to continue for a very long time. In the national parlance, Lippmann stated the needs as legitimate interests. For a researcher, the hidden poser in this avowal was that it was an accepted understanding till the end of the last global war that a nation needed to go to war to gain what it wanted. In other words, war was critical to governance if not everything about it. If war was required to attain human well-being, then security was not a separate part of it even if such well-being was selective.

3.3.2.4 1943. Walter Lippmann

As mentioned, Lippmann's finding in 1943 opened an alternate thought in the prevailing mindset on human well-being. According to him national security prevented the need to fight a war and assured victory if one had to fight. "A nation has security when it did not have to sacrifice its legitimate interests to avoid war, and is able, if challenged, to maintain them by war", he stated. War and military are still at the centre of this statement. This definition points out to a nation's legitimate interests that are not clearly articulated, but could be done with a little effort. It will be a variable based on opinion and also from system to system or state to state, that too based on time and period. Uncertainty can disconcert decision-making. It causes predicaments in military preparations. Lippmann's focus was military with diplomacy playing in the background. It could also be vice versa—diplomacy with military in the background. It is as good as stating, "National security means military power capable of protecting national interests". This definition points out the fixation on military strength (not exactly military might).

3.3.2.5 1945. US Senate Hearing—Looking Beyond Defence

Immediately at the end of war, there was a brief suggestion during the US Senate hearing that the concept of national security should be broadened beyond defense. It was a peep into a much wider connotation. It also meant defence was included in the concept. The windows were opened to look out.

3.3.2.6 1947. National Security Act and National Security Council, USA—War and Military Still Holds the Chunk of National Security Concept

The United States created the National Security Council (NSC) on 18 September 1947 to assist the President in national security, military and foreign policy matters.

Its immediate predecessor was the National Intelligence Authority (NIA) established early 1946. It was overseeing the Central Intelligence Group (CIG), the immediate predecessor of Central Intelligence Agency (CIA). The impact of the World Wars was showing on human systems including its psyche. The anxiety they created was bound to remain in the mode of governance of nations for a very long time without serious attenuation. It is reflected in the charter of NSC also. National security is mentioned separately from military and foreign policy as the purpose of NSC.

The NSC was formed based on the National Security Act, 1947. Majority provisions of the Act took effect on 8 September 1947, the day after the Senate confirmed James Forrestal as the first Secretary of Defense. The National Security Act restructured the United States government's military and intelligence agencies following World War II. Restructuring of such nature is a frequent process in every nation. Along with the definition and appeal of national security also changes relevant to the time. The NSC advocated "the concept of national security for preserving the United States as a free nation with their fundamental institutions and values intact". Here the terms free nation, fundamental institutions and values need more clarity. Does freedom mean the ability to dominate the world by coercive diplomacy or military power? It can be so considering the superpower status of the United States. It also means that the superpower, perhaps, will need an entirely new definition for national security, and, therefore, it is not the model applicable to other nations unless they are the prospective superpowers in a world that is yet to come. While fundamental institutions may be static unless seriously changed by constitution, the value system can always change. History proves it. Definitions by variables still do not achieve the required purpose of stability. That affects planning for governance.

3.3.2.7 1948. George Kennan's Idea of National Security—Sustainable Internal Continuum of Development without External Interference

According to George Kennan (1904–2005), the American diplomat, historian and the person behind the containment policy of the United States against the Soviet Union, national security is "the continued ability of the country to pursue the development of its internal life without serious interference, or threat of interference, from foreign powers". It contains all aspects of acquiring and retaining power for continued survival as a nation.

3.3.2.8 1950. Harold D. Lasswell—Political Scientist and Communications Theorist

Harold Lasswell (1902–1978), American political scientist and communications theorist, stated in 1950, when he was a professor in Yale Law School (160 years after the students of Yale University first mentioned about national security), that the

extent of security lies in the best balance of all instruments of foreign policy. Lasswell's expression of national security seemingly rooted on communication between nations. He had designed a communication model on the topic while teaching at Yale Law School (1948). His model, known as Lasswell's communication model, describes an act of communication by defining who said it, what was said, in what channel it was said, to whom it was said and with what effect it was said.²³ In May 1951 he published the book *National Security and Individual Freedom*²⁴ that highlighted the importance of the instruments of foreign policy consisting of military, diplomacy, information and economics. It included coordination in the handling of arms, diplomacy, information and economics. Lasswell's proclamation meant that all measures, which are proposed in the name of national security, did not necessarily contribute to the avowed end—it was the period perception in the evolution of the concept of national security. That means by 1950, with the exposition of Lasswell, national security extended from military security to economic security, geostrategic security and informational security.

3.3.2.9 1952. National Security Agency—Intelligence and National Security

The term national security is also used in explaining the National Security Agency in the United States. It is a national level intelligence organisation of the Department of Defense established in 1952 under the director of national intelligence. The NSA originated as a crypto decoding establishment during World War II. It deals with global and domestic communication intelligence and other intelligence monitoring, acquisition and analyses, though part of the department of defence NSA is an all-pervading national security agency and separate from the US Defence Intelligence Agency (DIA).

3.3.2.10 1962. Arnold Wolfers, Political Scientist—the Ambiguity Model

According to Wolfers national security meant different things to different people. Wolfers stated that while appearing to offer guidance and a basis of broad consensus, people may be permitted to label whatever policy they favour with attractive and possibly deceptive names. He was stressing on ambiguity in defining the term. For Arnold Wolfers (1962), "Security, in an objective sense, measures the absence of threats to acquired values, in subjective sense, the absence of fear that such values

²³“Lasswell's model of communication.” Wikipedia. https://en.wikipedia.org/wiki/Lasswell%27s_model_of_communication. Accessed 21 January 2020.

²⁴Lasswell, H.D. (1950). *National security and individual freedom*. McGraw-Hill Book Company, Inc.

will be attacked”.²⁵ Practicality of the idea should be the centre of the concept of national security, and the definition should point towards it. The strategist needs to mould it. In Wolfers’ statement, there were two unattainable situations: absence of threat and absence of fear. Both fear and threat are absolute forms of life’s paradox. They justify the concept of national security. National security governance is driven by inherent human fear in a world that is always under various threats that cannot be wished away.

3.3.2.11 1965. Institute of Defence Studies and Analyses²⁶—Defence and National Security

The Institute for Defence Studies and Analyses (IDSA), New Delhi, India’s leading strategic institute, states its purpose, “to conduct multidisciplinary study and research on issues of defence and national security”. In this statement,²⁷ national defense is separated from national security. It deals with India’s national security matters in which the concept is seen in the outlook of the immediate past around war and preparation for war as an instrument of national policy. It is funded by the ministry of defence and functions in international relations and providing training for government and civilian personnel on strategic issues. Its ideas are *seemingly original and India specific*. *IDSA admits that national security is a wider concept than defence.*

3.3.2.12 1968. International Encyclopaedia of Social Sciences—Protecting Internal Values from External Threats

One of the definitions of national security, as seen in the International Encyclopaedia of Social Sciences, was “the ability of a nation to protect its internal values from external threats”. It is precise and specific but very limited in applicability. The threat is perceived only to internal values—the target. The threat dimension is singular—external. It is a case that is applicable in a limited sense. Threat is multifaceted and multidimensional. It is explained later in the book.

3.3.2.13 1972. William D. Blair, Jr.—Natural Environment and Energy

William Blair, the US Deputy Assistant Secretary of State for Public Affairs, stated that the national security of the United States depended on many elements that

²⁵ Ibid.

²⁷ IDSA Journal, back cover and IDSA website <www.idsa-india.org>, 2000.

included balance of payment, economic affairs and foreign assistance. Such statements lead to the acceptance of the term as a concept besides foraying into its probable elements.²⁸

3.3.2.14 1973. John E. Moss. Member, US House of Representatives— Ill-Defined Phrase

According to John E. Moss (1915–1997), the American politician who championed the Federal Freedom of Information Act (FOIA) from the very beginning, national security was an ill-defined phrase. He brought out the paradigm of an ill-defined phrase in national security. Moss, also a naval veteran, contended that national security could not be defined precisely by anybody. But perhaps he had not realised that he was the architect of one of the prime documents of national security as it is being appreciated in this study—the Freedom of Information Act that brings transparency into governance as part of informational security. According to a Federal Court, the central purpose of the FOIA is to open up the workings of government to public scrutiny as an informed electorate is vital to the proper operation of a democracy.

3.3.2.15 1974. Maxwell Taylor—Non-military Threats to the United States

General Maxwell Taylor (1901–1987) spoke about the most formidable threats to the United States in the non-military field. The identified threats included energy crisis, population explosion, retarded economic growth, higher costs of industrial production, new deficits in international payments and rising inflation.²⁹ It may seem they are also the standard threats that any country may face at all times. But identifying and articulating them by the United States matter in those periods.

3.3.2.16 1976. Yale Review—Ambiguity Recognised by Courts

Moss's statement was soon followed by the Yale Review that stated even some courts considered the phrase national security notoriously ambiguous and ill-defined. Yale Review concurred with the ambiguity factor and imperfection in the definition of the concept.

²⁸Romm, J.J.(1993). *Defining national security—nonmilitary aspects*. Council of Foreign Relations Press. p. 7. Also see Chap. 2.

²⁹Romm, J.J. Ibid.

3.3.2.17 1977. Lester Brown—Non-military Threats to Global Community

Lester Brown, the founder president of the Worldwatch Institute, was vocal on the energy crisis and such “economic threats to security” as inflation and migration, as well as “food insecurity” and related factors such as deforestation, soil erosion and the threat of climate modification, including the greenhouse effect.³⁰ The list of concerns of national security started lengthening.

3.3.2.18 1981. Jordan and Taylor—More Extensive Meaning

Jordan and Taylor brought up the idea of looking beyond physical “harm” (read security). The time was getting ripe to think beyond physical boundaries in appreciating the concept that had been shadowing human system ab initio without a name. The idea implied protection through a variety of means of vital and economic interests, the loss of which could threaten fundamental values and vitality of the state. They referred to the concept as more extensive in meaning than mere physical security.

3.3.2.19 1983. Barry Buzan—Ill-Defined but Politically Powerful

Barry Gordon Buzan, Emeritus Professor of international relations, according to Romm, considers national security a weak and ill-defined concept but at the same time politically powerful and strong. Briefly said national security was a feebly defined concept but a powerful statement. Buzan attributes the ambiguity to “power-maximising” strategies of political and military elites for leverage over domestic affairs invoking it. It can bring in the contention that the ambiguity is deliberate and aimed at power maximisation. In other words Buzan reiterated the imperfection in the definition of national security but considered the concept to be strong with the potential for power maximisation under ambiguity.

3.3.2.20 1983. Richard H. Ullman—Concern for Quality of Life of People of a State and Governance

According to author historian Richard H. Ullman, a threat to national security is an action or sequence of events that threatens drastically and over a relatively brief span of time to degrade the quality of life for the inhabitants of a state or threatens significantly to narrow the range of policy choices available to the government of a state or to private non-governmental entities (persons, groups, corporations, etc.)

³⁰Ibid., p. 7. Lester Brown mentioned it in his paper “Redefining National Security”.

within the state. Here the affirmation is on quality of life and the factors that threaten it. Next, the interpretation focuses on the nature of government—the process of governance itself. He narrowed down to the quality of life and the range of policy choices available to the government or private non-governmental entities.

3.3.2.21 Jessica Tuchman Mathews—Broadening the Definition of National Security

Jessica Tuchman Mathews, Vice President of the World Resources Institute, wrote, in the 1989 issue of *Foreign Affairs*, that global developments suggested the need for broadening the definition of national security to include resource, environmental and demographic issues.³¹

3.3.2.22 1990. Charles Maier—Power to Control

In Charles Maier's outlook, national security turned the hue towards the power to control. He defined national security "as the capacity to control those domestic and foreign conditions that the public opinion of a given community believed necessary to enjoy its own self-determination or autonomy, prosperity and well-being". In this approach autonomy is alternated with self-determination, but the fact that self-determination can be a challenge to the needs of the weaker has to be taken into consideration. Majority votes need not satisfy security requirements. He considers the concept to be the capacity for self-determination or autonomy, prosperity and well-being. The term well-being is articulated by Maier.

3.3.2.23 1991. Theodore Moran—Geostrategic Security Issues for the United States

Theodore Moran, Director of the Program in International Business Diplomacy at Georgetown University's School of Foreign Service wrote in *Foreign Affairs* (Winter, 1990–1991) six issues for consideration for the United States in the geostrategic context. They were:

- Encouraging stability and reform in the Soviet Union.
- Maintaining a cooperative US-Japanese relationship.
- Avoiding vulnerabilities from the globalisation of America's defense industrial base.
- Reducing dependence on oil from the Persian Gulf.

³¹ Ibid.

- Moderating the impact on the Third World of the prolonged debt crisis.
- Limiting damage from narcotics trade.³²

3.3.2.24 1992. End of Cold War—Ushering a New World Order?

The 46-year period between the end of World War II (2 September 1945)³³ and the dissolution of the erstwhile Soviet Union (26 December 1991) is generally considered to be the period of Cold War. The world turned around on a bipolar symmetry similar to a world war with conflicting ideologies and subsequent containment policy of the United States against the Soviet Union and its supporters. The scenario was that of a war of sorts. The Cold War on a bipolar obverse was fought on political, economic and informational (propaganda) fronts. Recourse to weapons was limited.

According to the author, the exact reasons of Cold War are yet to be analysed, and it is doubtful whether it could be done without bias. But the fact remains that the advancements of the world during the Cold War period was amazingly superior to any other period before that. This itself justifies the adage that progressive inventions thrive in a destructively opportune environment, and the Cold War provided the perfect scenario for such development. The majority of thought processes on the national security front including geostrategic context found their ways out during the Cold War. The idea was to “defeat” or “win over” the prime polar opponent using all the tools of national security. It was not clash of Titans but trance of polarities, especially global polarities not religious polarities. The concept of national security found its place firmly established during the period.

3.3.2.25 1995. ECSA Conference, US—Reconfiguration of European Strategy into Enhanced Security Concept

In a paper delivered at the ECSA (European Conference on Software Architecture) Conference in May 1995, scholars James Sperling and Emil Kirchner highlighted the changing definition of security against Europe’s strategic landscape.³⁴ The call for redefining came up under the increased security concerns of individual states and the NATO (North Atlantic Treaty Organisation) alliance where preoccupation of territorial integrity and military security tend to broaden into macroeconomics, environment, etc. It meant that national security should include non-military security also leading to overall well-being of a nation and its people.

³² Ibid.

³³ It was generally accepted at the time that the war ended with the armistice of 14 August 1945 (V-J Day), rather than the formal surrender of Japan, which was on 2 September 1945, that officially ended the war in Asia.

³⁴ James, S. & Emil K. (1995). “The changing definition of security.” ECSA Conference. http://aei.pitt.edu/7020/1/sperling_james.pdf. 12 January 2019.

3.3.2.26 1996. National Defence College, India—Seminar on Maritime Strategy. Beyond Military

A seminar on maritime strategy at the National Defence College (NDC), India, was vocal on various other elements of national security including resource security. The findings of the seminar resolved that, “A nation’s security flows from an appropriate and aggressive blend of its political resilience and maturity, human resources, economic structure and capacity, technological competence, industrial base and availability of natural resources and finally its military might”.³⁵ The speakers stated that when it came to planning, the tendency was to focus on clearly identifiable military threats to territorial integrity alone.³⁶

3.3.2.27 1996. Battle Scene 2020—Seminar at the Defence Institute of Psychological Research, India

In a seminar at the Defence Institute of Psychological Research (DIPR), New Delhi, India, R. Gopalaswamy and others acknowledged that national security implied far more than the traditional concept of pure military power with its supporting hardware. It encompassed all the major elements affecting the development of a free nation state: geopolitical, economic, technological, ecological and demographic. Non-military factors could impact the progress of a nation in very significant manner demanding a holistic approach.³⁷ This resolution in a seminar meant exclusively to the identity of the battle scene in 2020 and the appropriate revolution in military affairs (RMA) was one of its kinds on national security. But the participants were equivocal on the need for expanding the definition and scope of national security. It also showed the projection and influence of the concept in today’s strategic psyche. Such thinking invalidates the military theory as the sole element of national security.

3.3.2.28 1998–1999. Changes in Perception of National Security in India—Beyond Military

According to P.S. Raghavan, former Chairperson of India’s National Security Advisory Board (NSAB), India’s national security approach took a turn subsequent to the nuclear tests in 1998 and the war with Pakistan in 1998 localised along the line of control (LOC) in Kargil. India was following a security approach of 1947 vintage.

³⁵National Defence College. (1996). Proceedings of seminar on "A maritime strategy for India." p. 22.

³⁶Ibid. p. (i).

³⁷Gopalaswamy. R, et al. “A strategic framework for national security” in *Battle scene in Year 2020*, edited by Chaudhary, P.N. and Selvamurthy, W. Defence Institute of Psychological Research. (Year not mentioned), p. 16

There was a comprehensive review that resulted in a major overhaul, ensuring tighter coordination between the various security structures, reforming the higher defence organisation and bringing in a holistic approach, recognising the political, economic, technological, ecological and sociological factors impacting on national security.³⁸

3.3.2.29 1999. Jaswant Singh in “Defending India”—National Security on a Larger Canvas

K. Subrahmanyam (1999–2011), who was the head of the National Security Council Advisory Board (NSCAB) of India, in his introduction on author Jaswant Singh’s book “*Defending India*”, mentions about the author, a former defence minister of India, conceptualising national security in broader terms encompassing economic development, food security, energy security, environment, etc., including evolving threats.³⁹

3.3.2.30 1999. Vinod Saighal—National Security Includes Concern for Global Equipoise

Author Vinod Saighal stated about India, “If India’s national security aim for the second half of the 20th century could have been succinctly defined as the preservation of India’s unity, the country’s aim for the first half of the 21st century could equally succinctly be defined as the preservation of the integrity of the subcontinent, as an essential prerequisite for the global equipoise for the third millennium”.⁴⁰ Here unity precedes integrity in an idealistic statement. This statement is relevant here if India needs to plan specifically for the twenty-first century. India’s state of national security can be assessed with a view to define the concept as deemed fit in the chosen approach for research by concerned scholars according to their perception and narrated with the present anytime during the century which is in its nascent stage at the moment. The author’s perception of national security is in a subjective mode as an evolutionary concept that has time to shape into an objective of national governance in course of time. Changing direction can distort definition. It is a cautionary statement. The suggestion, therefore, could be seen as maximisation of yield from the defined concept. It is an important finding. Maximisation of a concept is a desired process in its governance by objective when the exact limit is neither

known nor can be reached by the very nature of the concept. Idealism (wish list) may be avoided as far as possible while dealing in national security governance.

3.3.2.31 2000. Kargil Review Committee Report—Importance of Intelligence

Though India was fervently at war of different kinds more or less continuously with its countervailing adversary Pakistan and once seriously with China (1962), the thought about national security shifted seriously only after the Kargil War (author). The Government of India formed a Kargil Review Committee (KRC) on the third day the conflict has ended. The Committee was asked to examine the sequence and submit a detailed report for the future. The armed conflict in Kargil (3 May–26 Jul 1999) and happenings around had jostled the Government of India. The Committee found flaws in intelligence, operations and information sharing. The report of the Committee was tabled in the parliament on 2 February 2000. Certain parts of the report are not in the public domain. The report was heavily critical of India's national security system and the lackadaisical approach of the country since independence in 1947. The entire process here is focused on national security as military security and not beyond.

The report led to the setting up of a group of ministers (GoM) and task forces to examine the security system.

3.3.2.32 2000. Anuradha M. Chinoy—Changing the Traditional Notion of National Security

Writer Anuradha M. Chinoy stated that it was time to decide whether to retain the traditional notion of national security or to think an alternative.⁴¹ What is the traditional notion of national security? Can it be taken as physical security of a nation which could be termed as military security? Physical security is the original concept. But the fact that national security (whatever it is called) is paramount to modern states reflects in the statement of the author. National security is vital for a state to create and maintain political and other structures and order within to ensure human well-being. Chinoy states that, for national security, the state combines force through its military power and consent.⁴² Neo-realist (and realist) theories that provide the theoretical foundation for this argue that the security of individuals is linked with the state that preserves the special order and protects them from invasion of the aliens and from injuries to one another. In the national security discourses, the state has shown masculine and virile only when it has adequate force (including

⁴¹Chinoy, A.M. "Peace Process: Towards a Gendered Human Security." *The Times of India*, Mumbai. 20 December 2000. p. 10.

⁴²Ibid.

nuclear capacity) and is seen as emasculated and categorised without it.⁴³ Is it the soft state (not soft power, another ambiguous term) syndrome? A nation is identified as a soft state when it cannot face the threat and thereby avoids it. It is evident in a situation when a national airline is hijacked to an unwieldy terrain without a snack bar and the country is kept hostage by a bundle of gun-wielding thugs who haven't had a shower for months (they stink; that is the worst part of being traumatised as a hijack hostage in the claustrophobic tube of an aircraft!). Here the entrapped passengers are symbolic to the country. The government yields, more under internal pressures than that from the hijackers, and releases the prisoners in exchange of lives of the passengers who go through unimaginable trauma. What happens here? The will of a country is broken. It crawls to please the hostage takers. It succumbs to internal and external pressures at the same time. Opponents have a field day. Often the public is not aware of the happenings in the background. They watch the news breaking on their telly tubes in the comfort of their homes.

3.3.2.33 2001. Group of Ministers, India—External Environment and Internal Situation

The report of the Kargil Committee was examined by a group of ministers. The report of the group recommended national security to be seen “as a function of a country's external environment and the internal situation, as well as their interplay with each other”.⁴⁴ The seemingly vague statement gives provisions to think about national security beyond military security. Features of the prevailing international order, position of its immediate and extended neighbours and the major powers were taken into consideration giving an edge to geostrategic context.⁴⁵ God made an attempt to reform India's military security architecture and the overall national security approach.

Various other committees and task forces were followed. But the idea of national security stood firmly in its military and associated strategy fixation. The situation soon became bureaucratic without any practical expansion on the ground. National security remained where it was—without a proper definition.

3.3.2.34 2001. Indian Navy. International Fleet Review Seminar—National Security is not Just War Fighting

The naval strategists present during the seminar associated with the international fleet review of the Indian Navy at Mumbai, India, on 16 February 2001 were interestingly thinking much ahead on national security concerns. In spite of being

⁴³ Ibid.

⁴⁴ Recommendations of the Group of Ministers, 2001. Ibid. p. 6.

⁴⁵ Ibid.

from a military armed force, the naval thinkers were unanimous in their appreciation of national security as a multidimensional concept comprising political, environmental, economic, defence and cultural aspects. There was general consensus that it was not just a matter of war fighting and combat preparation. This was a deviation from the sheer military fixation of national security.

3.3.2.35 2007. Prabhakaran Paleri (author)—All Compassing National Well-Being as the Goal of Governance

In a serious research study⁴⁶, Prabhakaran Paleri, the author, had identified and proposed a definition to the concept of national security along with its elements and further proposal to consider it as a tool of governance towards the identified objective of human well-being. This theory is revisited here with proposals for creating a national security index through further and continuing research in governance by national security.

3.3.2.36 2011. Framework Document (05/2011), *Instituto Español De Estudios Estrategicos, Madrid*⁴⁷—National Security as an Evolving Concept

This paper mentions about two concepts of security: one where state is the centre and the other considering external and extraneous factors as the drivers of security. But the important element here is that both arguments support that security is beyond military engagements and also support the concept that national security is evolutionary and is enlarging beyond military security into global sovereignty. At the outset, the paper also points out the controversies regarding the role of state concerning the notion of security in its achievement. According to the document, in Europe, the approach to security was traditionally wide using non-military resources. Ultimately anywhere political power determines the orientation and meaning of security.

Accessed 12 March 2019.

3.3.2.37 2017–2018. Reviews in India—National Security Thinking as a Continuing Process

India carried out a set of reviews in 2017–2018 on the changing norms of national security thinking adaptable to the country. It resulted in further structural reform, taking cognizance of the global geopolitical flux, a revolution in the nature of military conflict, the transformative role of technology in every aspect of internal and external security and the challenges arising from India's strategic ambitions. The reformed and new structures emerging from these reviews are still a work in progress that would require a coordinated, all-government approach.

In all these examinations, it can be seen that national security concept is not an afterthought of a few leaders in governance, but a prime contemplation of responsible people who felt the need to move along more seriously in governance of a nation. This thought was more or less continuous since the world sopped up the horrors of World War II. Interestingly, unlike many other concepts and ideas, the term did not originate from the military based on the needs of war but from the political system based on the need for total governance. That brings the concept closer to governance than military might. Therefore, it can be said that the concept of national security came out of the military thoughts and lap dissolved into political thoughts and thereby national governance in course of its evolution.

In the present examination by the author (2021), it is a revisit to move ahead in the study of the concept of national security by examining the conceptual thinking, elements and terrains.

The examined statements over the period though not elaborate firmly establish the evolutionary idea of reality of national security and accept the fact that the term is ill-defined and used as required in accordance with the users policy and purpose. The definitions are with choice toppings even though the underbelly seems to be rather identical. It is about the security of the people in a nation state as identified presently. The security is not just physical but also covers other aspects of day-to-day life based on devoted human needs.

The random timeline is summed up below:

- (1) Pre-1790. Physical security.
- (2) 1790. Yale University on fostering industries.
- (3) 1914–1918–1939–1945. Global wars and interfacial period. Fixation on war and collapse of governance.
- (4) 1843. Walter Lippmann.
- (5) 1945. US Senate hearing—looking beyond defence.
- (6) 1947. National Security Act and National Security Council, USA—war and military still hold the chunk of national security concept.
- (7) 1948. George Kennan's idea of national security—sustainable internal continuum of development without external interference.
- (8) 1950. Harold D. Lasswell—political scientist and communication theorist.
- (9) 1952. National Security Agency—intelligence and national security.

- (36) 2011. Framework Document (05/20110), *Instituto Español De Estudios Estrategicos*, Madrid—national security as an evolving concept
- (37) 2017–2018. Reviews in India—national security thinking as a continuing process.
- (38) 2021. Prabhakaran Paleri (author). Changes in conceptual thinking, elements and terrains.

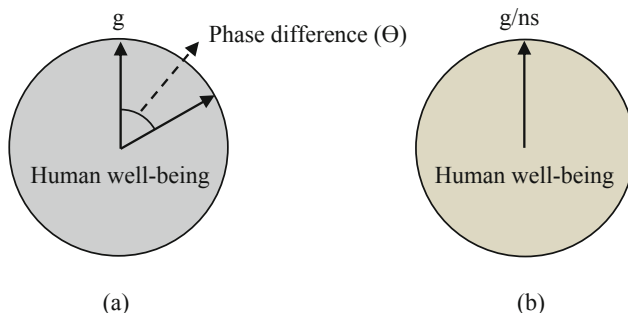

3.3.3 *Conceptual Ambiguity*

The ambiguity in the concept of national security is natural considering the requirements perceived by each nation. It arises from the bifurcations on threat perception, identifying the ideas of “nation” and “security” and broadening the definition by induced ambiguity for power maximisation. It is, therefore, necessary to examine the very concept itself. Does it exist and, if so, in what form? Does it change according to times? Is power maximisation the sole motive? Can’t the world, as a whole, accept it as a unified concept? If not, can a special standard to compare various perceptions of the concept be established? These questions will be answered. National security concept exists as seen from its references as well as establishments across the world. Its importance is increasing. It is a subject for the world to define, look up and maximise as a singular entity for the benefit of people. It is expected to guide governance towards the well-being of the people of a nation. It is a global subject; the trends are that it may refuse to be contained within the rudiments of nationalism in course of time, however long it may be. It also takes on the fact that ensuring territorial inviolability is only part of the concept and not the concept itself. This argument rules out the conviction that military security is national security.

Take the case of India. It had come out in the reports in the wake of the Indo-Pakistan conflict in Kargil in 1999 that India was not prepared militarily.⁴⁸ The opinion came up in 2020 stating India is yet to learn the lesson, obviously of national security. That is 73 years after independence from colonial rule. The opinion was aimed at military security, safeguarding the interests of the nation from external aggressors. The recommendations included creating a National Security Council, joint command concept, nuclear doctrine and other subjects related to military strategy rather than an overall national security strategy involving non-military aspects. The opinion doesn’t indicate that India is in a kind of disorder. The extensive Kargil Committee Report of India did not define national security holistically.⁴⁹ Obviously the purpose was to avoid another conflict of similar kind. At the same time, India is aware about the importance of national security beyond military security for holistic well-being of its people. The efforts of the governments are in that direction. However there is much to do to align national security as a wholesome concept with governance towards well-being of people which is generally the same all over globally. The ambiguity will continue till national security is aligned with governance towards well-being sans any kind of phase difference.

⁴⁸Panang, H.S. (2019). “20 years on, a Kargil lesson still holds true: Indian Army can’t afford to learn on the job.” <https://theprint.in/opinion/20-years-on-a-kargil-lesson-still-holds-true-indian-army-cant-afford-to-learn-on-the-job/267613/>. Accessed 28 January 2020.

⁴⁹The Kargil Committee Report in its unclassified form was published in paperback under the title: “From Surprise to Reckoning” by Sage Publications, New Delhi, in 1999. The terms of reference of the Committee was to review the events that lead to the Pakistani aggression at Kargil, India, and to recommend measures to safeguard national security against such armed intrusions. p. 25.

- (a) Governance (g) not aligned with national security (ns). There is phase difference (Θ) between national security and governance (ambiguous).
 (b) Governance aligned with governance wholesomely. No phase difference with governance (unambiguous).

Fig. 3.1 National security and national governance—ideal scenario

Figure 3.1 shows the ambiguity between national security and national governance. In such case there will be a phase difference from the ideally desired situation. Governments will have to align national governance with national security all the time. It is the challenge of governance provided national security is the defined objective of governance for the government.

- (a) Governance (g) not aligned with national security (ns). There is phase difference (Θ) between national security and governance (ambiguous).
 (b) Governance aligned with governance wholesomely. No phase difference with governance (unambiguous).

The governments can choose either (a) or (b) and still achieve total well-being. But it will be difficult as the governments may have to put up more effort which will increase the probability of confusion. The anarchic factors will be more prominent in the ambiguous process with a phase difference. The present situation the world over is (a) in varying degrees with different phase differences. Governments are used to such methods off governance ab initio. Only the level and degree varies from nation to nation and government to government.

There will be more viewpoints on national security that will carry the ambiguity further. The definitions will be based on the time or period controlled perceptions of life. Votes will sway based on such perceptions in electorates. Victory and defeat of a political candidate in an election will be based on such vacillating modes of perception. But a strategist who provides support in planning to a government cannot hang on to turnstile perception. The perception has to be realistic, firm and visionary. Planning is for the future, and any decision taken at a point in time will have its impact at different points later.

3.4 Changing Times and Landscapes: Search for a Model

Though security is a primordial quest for humans and human systems, the term “national security” as projected today is a recent development. The current expression originated in the United States as part of the evolutionary process. Other nations accepted it appropriate to their requirements. For the United States, the threat perception is far reaching. It is beyond national boundaries with the concern centred on the “homeland”⁵⁰—the new term in circulation after the chilling terror attacks on 11 September 2001.⁵¹ The core of the concept remains intact, though secondary parameters may have changed. It is, therefore, pertinent to see the changes through the periods in the original conceptual system in the United States to follow the path. But the difficulty is in deciding whether it is the American model that is to be considered by the rest of the world or not. The reason is simple. The United States is taken as a superpower. If so, its objectives have to be different. The model it follows in national security is for itself and the prospective superpowers of the world to consider with appropriate adjustments once they hold the post replacing the controlling superpower. The world may become monocentric from power perspective with the instatement of a nation as the superpower by acceptance of its presence by others subliminally or otherwise. But it will always have a counter under the balancing theory of a system. The world became monocentric briefly after the clash of ideologies of the Cold War and subsequent dissolution of the Soviet Union by micronisation. As mentioned earlier, monocentricity creates unstable equilibrium in the polar stasis. Soon bipolarcentricity stabilises the system in the presence of a potential superpower. The concept of superpower in the world of nation states is different from that of the empires of history. It is a new development and is a sign that the world better does not miss. The word “super” is an adjective lavishly used to indicate the entity that more or less tops in a particular field. In the case of a country, it will be the one with higher bargaining and negotiating power. The power is generally derived from econo-military supremacy. The super entity will get immediately countered by the potential superpower that may replace it after a period of time according to power shift. The views of the world are paramount in decisions on national security. People’s opinion will vary with generous indulgence in possible alternates. The views have to be analysed from all angles before conclusion.

Romm⁵² quotes two periods in broadening the idea of national security in the United States within the span of a decade. The first occurred in mid-1970s after the

⁵⁰Homeland is exclusively American as many other forms of logical convenience in American communication are. Other global terms with similar meanings are motherland and fatherland.

⁵¹The Islamic terrorist group al-Qaeda carried out four coordinated series attacks against the United States on 11 September 2001. It was the single deadliest terrorist attack in human history and the most dangerous and testing experience for firefighters, law enforcers and the local public in so far in the world in an “other-than-war” situation. This single incident brought the focus on “homeland security” which for this study is another form of military security coupled with law enforcement.

⁵²Romm, J.J. (1993). *Defining national security—nonmilitary aspects*. Council of Foreign Relations Press.

humiliating defeat in Vietnam. Inflation rose among the growing economic strength of Japan and Europe and the first oil shock. The second period began in the late 1980s with the changes in global development demanded broadening the definition and scope of national security.

Major suggestions from scholars in the United States were about threat perception, geostrategic impacts, retention of superpower status, conditions for survival and economic and energy security aspects. The inkblot of evolution of national security was naturally widening. The list of Theodore Moran seemingly did not anticipate the effects of disintegration of the Soviet Union two years hence. Period analysis of the development of the concept of national security in the United States could be seen also outside Romm's findings. The first period could be dated back to the Japanese attack on Pearl Harbour (7 December 1941) that was impetuous for the determined entry of the United States into World War II and the final take with a nuclear showdown. If the debacle in Vietnam broadened the perception further, the third period commenced with the terror attack on 11 September 2001 when it unilaterally decided to counter the attack on its homeland. The twenty-first-century "war on terror", as the United States rationalises the act, supports military involvement to counter terrorism. It was more a transformation in policy of national security than seeking revenge in its latest form. The transformation originates from the realisation that a superpower loses geostrategic esteem when it is projected vulnerable to terror or military attacks on its own soil. The concept of homeland security for the United States reflects shades of military security applicable to other nations, though the concept of national security permeates beyond military affairs.

The observations so far are limited to period and space, but they broaden the concept of national security beyond military affairs. Besides they suggest that the concept gradually evolved to include components other than military in its domain. This also means national security is not a unitary domain. There is no singular expertise in national security governance. National security is a multidimensional reality concept. In the concept of a state, nothing defines the concern for its people better than its constitution, and the best way to view a constitution is from electoral institutions. The two constitutions examined in this chapter (those of India and the United States) and the United Nations' humanitarian concepts point out the basic concern for humanity. According to the UNDP, they are justice, liberty, equality, fraternity, unity and integrity, welfare, equality and freedom. At the end of the never-ending road, it is all about the well-being of the people under the principles of equality for the unity and integrity of the nation state. It is different from human development, improving quality of life or aiming at the chimera of absolute happiness. National security provides for apparent security, which is for everybody. Examination so far percolates to reliable conclusions on the subject.

Searching for a model for national security that fits all is the objective of this study. It is an established fact that the concept is real. It relates to safety, security and aspirations of the people as perceived by them. Originally it is an American concept that has been identified and recognised by all geopolitical entities laterally formatted for established governance. Overall, national security is about governing for the well-being of the people based on their apparent needs extended to perceived

security. Within this context the definition of national security and any model based on it should fit all the population as perceived security concept is common to all—"I want more than what I need". The concept thereby becomes universally common in any form of government and the relative polar position of the population. This also shows that national security is a definable concept. Similar to any other concept, the definition has to be arrived at by closely examining the existing definitions and the evolutionary process from the beginning.

Once defined, national security becomes a measureable concept manifesting in comparative formats. It originates from the fact that humans were historically concerned about their safety and security. It is the same security principles coupled with the understanding of human aspirations that are to be considered within the framework of a nation. Prior to homing in on a definition, it is important to appreciate the characteristics, contents and objectives of national security concept.

3.4.1 Characteristics, Contents and Objectives of National Security

National security is a concept. Hence, it should comprise various elements. The elements will have the characteristics appropriate to the concept. They need to be identified before any parameter is tested for considering an element. The first and foremost principle will be an element that is not a condition or opinion. The concept reflects in its element. The parameters of an element should also be integral to the evolution of the concept. It means the elements will be mutually inclusive. Being evolutionary, the social concept would have had elements that were prominent at a particular time in the past but lost importance subsequently. This also indicates that there could be additional elements appearing in the future. The elements of national security will be examined against the set conditions separately. Identifying the constituent elements of national security is important to manage them to maximise the concept. It is the primary purpose of national governance. The author in this study identified 16 elements⁵³ that are expected to contribute towards national security in an interactive matrix. The elements are explained in Chap. 6.

Conditional factors of national security are paramount in problem-solving and decision-making. Often there can be misrepresentations especially in terms of elements and threat perception. The misrepresentation is caused by ambiguity and often turns the system towards the symptoms for treatment rather than the actual problem. Diagnostics will not be appropriate. The need for identifying the conditional factors, therefore, is paramount to separate them from the elements of national security. This is further explained in Chap. 6.

The prime characteristic of the concept is the well-being of the people as the way they perceive. The authorities accountable to providing national security are

⁵³ Ibid, pp. 66-67.

obviously those who appreciate their responsibility under delegated authority. The provider of national security, thereby, becomes the authorities of a chosen government.

Once authorised by a governmental system, the objective of national security ultimately becomes maximising the well-being of the people through governance. This, in turn, becomes the overall objective—maximisation of well-being of the people of the nation. Hence, maximising national security becomes the objective of national governance. Approaches could be several. The initiated in national security governance may experiment with its principles in all types of human systems even extending to global systems. This study is limited to national security governance for maximising the well-being of the citizens of a nation.

3.4.2 Other Parameters

There are various other parameters as intellectual inputs which include geographical location, continuum stasis, periods of stability, attitudes of superpowers, attitudes of other powerful nations, neighbourhood diplomacy, safety and security often referred to as internal security, law and order, rule of law, economic vulnerabilities, environmental sustainability, social equilibrium and a host of others. All the parameters can be singled out into a limiting factor in governance—threat perception. Threat is forewarning of impending danger or harm. It is multidimensional and can be identified even if invisible and abstract. The author, after a serious study, has classified threats along a three-dimensional cube: external-internal, covert-overt and direct-indirect.⁵⁴ The types of threats as per the cube are real and present in any security system. The degree or the intensity of a threat may vary with respect to time. The search for a definition should begin in correlation to the threats identified in the threat matrix cube. While the threat matrix will remain unchanged, the nature of threat and its intensity will undergo continuous changes within it. A detailed analysis of threat perception and its multidimensional character and interactive matrix is given in Chap. 4.

Parameters consistent with the components and meaning of the term “national security”—nation and security—have been examined. Security relates to the satisfaction of human needs, but the perception includes human wants too. The security provider has to understand it. Balancing needs with wants takes away the time and essence of national governance. Nation is an entity within a human system boundary. The boundary is dynamic and volatile. Security is a variable in perception as well as availability. But it is not a variable in concept. Nations may change in profile and character. Within the volatility of a nation and its governance, the concept of national security can undergo changes coupled with chance. The formula for

⁵⁴Paleri, P. (2008). *National security: imperatives and challenges*. Tata McGraw-Hill Publishing Company Ltd. pp. 60-61.

national security will be contingent to such changes. National security as a concept is a function of time. The catch here is that the definition should remain definite without being affected by the functionality of the concept with time.

3.5 Global Security—Hesitant Pragmatism

The national security model ideally should be applicable to the overall global security. But the global arrangement is not as a system. Even then the idea could be administered by the United Nations under the collective security regime by modification. The global entities can be brought under the global security regime following the model of national security. Therefore, the definition of national security should be applicable to global security also.

The first step for global security was unwittingly taken, when the League of Nations was founded on 10 January 1920. The goals included disarmament, preventing war through collective security, settling disputes between countries through negotiation diplomacy and improving global welfare. There are many hidden factors of national security so far examined in it—military security, geostrategic security, environmental security and economic security are a few that can be pointed out. Besides, global welfare can be interpreted as global well-being where well-being of the population is the prime aspect of national security. Global security is also a parameter while considering a definition for national security. Events that may threaten the existence of nations as separate entities can accelerate the world towards global security. The chances are quite limited in a binary bipolar world, though. The integration of nations under the European Union, erosion of governmental power under globalisation and the US campaign of “war on terror”⁵⁵ that commenced soon after the 11 September 2001 terrorist attacks in New York and elsewhere have united (again unwittingly) a good part of the world mindset, if not nations and its peoples.

In national security, a nation has to have control over the global decisions that may affect its security. A nation does not mean the government. Nations are larger than governments. Nation states in their original forms are not decided by the people. People are decided by nation states once they settle down there. Once settled, people decide their governance. Children do not decide their parents, at least before birth. They can divorce their parents or get emancipated from them if such law exists or simply go away from them if there are sufficient reasons.⁵⁶ Arguments for plebiscite in a human system are freaky attempts of skewed thinking, though wily and crooked at times. The freakiness can be exposed in the question: If plebiscite is a choice, why can’t it be applied worldwide once for all? Can the world population be given one

⁵⁵The United States’ campaign of war on terror commenced soon after the extremists hit the country on 11 September 2001 much to the shock and dismay of the majority world population.

⁵⁶Legal situations vary from country to country.

final choice to decide their country? What will be the result? Imagine a plebiscite, once for all, under the (currently) highly confused and unstable UN for the whole world population to choose their favourite country! The decision will sway according to the affinity of the people and their groups based on the binary polar stasis—national polarity or religious polarity. Such a plebiscite may halt migrations of all kinds temporarily. The whole concept of plebiscite in any part of the world considered under dispute could be a reflection in absurdity from this perception. Once the world has accepted the principles of nation states, it is also important to concede to the fact that it is the nations that decide their people and not the people who decide their nations. It is the natural process, hence naturalisation, though this statement may look even intellectually absurd and hard to grasp. This revelation will come when people understand that they have no choice in the game from parents to a nation. This statement—family to nations—fits perfect in a human system. One needs a family or a nation first if he or she has to leave them for another including nothing. It is not possible in the case of a nation or citizenship presently. Desettlement in a human system of any kind is quite vicious for a human. Fragmentation by partition, demographic elevation or outnumbering, etc. is a different game in geopolitics. A nation is stable when it sways well without breaking down in all kind of turmoil internal and external to it. It is like a building reaming unfailingly in an earthquake. Absence of turmoil is not indicative of stability. Stability is the ability to withstand turmoil. That should come out of governance in the human system.

3.6 Calling Finals—Defining National Security

Definition of an evolving concept invites ambiguity and associated semantic dissonance. One of the ways to minimise ambiguity in a definition is to formulate a complementary statement. It is possible by introducing a mathematical variable. A suitable variable, as a function of time, will be an index for national security. Once the national security index (NSI) is introduced, the concept can be explained as a measurable entity: “The state of apparent well-being of the people of a nation based on the aspirations of the ordinary people of that nation”. This is not the definition, but perception of the concept prior to defining it. The state of well-being should be indexed within the acceptable parameters particular to each nation. Here it is necessary to elaborate on a nation, its people, the meaning of the term, ordinary people and their aspirations in understanding the process of approach to a definition. People are central to it. They aspire for perceived security within their own limitations. It is applicable to the entire people of a nation—the super-rich, rich, lower rich, middle, lower middle, poor and below it, the seven generalisations of people in terms of wealth and purchasing power.⁵⁷ This scale can be extended or narrowed down,

⁵⁷ Author. There could be one more level—above the super-rich. The people at this level can get into the illuminati syndrome (Chap. 10).

topologically or otherwise. With this foreclosure and probability of introducing a mathematical assessment index, the term national security can be defined as:

The measurable state of the capability of a nation to overcome the multidimensional threats to the apparent well-being of its people and its survival as a nation state at any given time, by balancing all instruments of state policy through governance, that can be indexed by computation, empirically or otherwise, and is extendable to global security by variables external to it.

The definition of national security is according to this study under the condition that it is not physical security of the nation but the overall well-being of the people (Box 3.3) as the end objective of governance. This definition also nullifies the concepts of military security and non-military security as the two separate and mutually exclusive conditions framing the purpose of governance. Military security in this study is one of the 16 elements of national security, and the concept of non-military security as a term is null and void in governance. National security hence becomes the unitary objective of governance in which all the elements are inclusively important and participative.

Box 3.3 So, What Is National Security?

“The **measurable** state of the **capability** of a **nation** to overcome the multidimensional **threats** to the **apparent well-being** of its people and its survival as a nation state at any given time, by balancing all **instruments of state policy** through **governance**, that can be **indexed** by computation, empirically or otherwise, and is extendable to **global security** by variables external to it”.

- Measureable state of well-being of the people of a nation at any given time as a national security index which will help to assess the governance comparatively with periods and among nations.
- Well-being is apparent, which a government can provide by maximisation of governance effort by aligning perceived security.
- Global security is not a term that exists today under a definition but is an expected stasis when the entire world will be governed under the principle of national security concept as per this study. Such a state is not expected collectively as global system is not a defined system in the absence of a system boundary.

Well-being in governance is about the population of the country getting elevated by the fulfilment of their “needs” to the conditional state of apparent security. This is not a fixated stasis, but a moving average activity of a conditional feeling. Well-being in governance is the overall telling on a human population, which will be at different levels in relation to individuals and time. It will never be at a previously identified and decided level. It is not a fixed target with a bull’s eye painted on it, but a goal towards which governance should progress like a ship making way towards the horizon that is visible. Such a ship never attains horizon but traverses long

distances well with a purpose and a sense of well-being. The well-being is with respect to time and the appreciated human needs collectively as well as individually. It needs to be measured according to the situation on the ground with respect to the deeds of governance and needs of individuals and groups. It cannot be on any previously defined scale in units or other metrics. The common paradigm could be that the people in a system will be in a self-actualised state if they are feeling well at a particular time. A person or a group if not self-actualised can be at a neutral state or an agitated state. The degree of neutrality as well as agitation varies with respect to its seriousness. This doesn't mean a social agitation is a sign of absence of self-actualisation and thereby well-being. People may agitate comfortably in a state of well-being as perceived security stimulates further action. An agitation can be a sign of well-being or absence of it. This has to be carefully monitored by governments to make decisions. Many agitations under democracy show the freedom to agitate and express the feelings and hence are signs of well-being.

A query that can break onscene at this juncture is about the nature of well-being. There are two types of security—apparent and perceived. Apparent security is when the needs are satisfied, whereas perceived security depends on wants fulfilment. So, can there be apparent well-being as well as perceived well-being? The answer is no—for well-being is a state of mind, not a condition of mind. Well-being is therefore a singular state based on the cognitive combination of thought process as a resultant of the need and want satisfaction.

Another question that arises is whether self-actualisation can be a parameter in appreciating population well-being. The author in his previous studies in national security took self-actualisation as a measure of well-being. The approach taken was through Maslow's hierarchy of needs where self-actualisation is at the apex of the pyramid of needs. While well-being is a variable and conditional target, self-actualisation is an approach path. Further studies show a hypothetical standpoint where self-actualisation is not taken as a stasis but an experience that could happen any time in an activity. This has been highlighted in author's studies on human investment management. Human investment management (HIM) considers self-actualisation as a periodic elevation of the mental state in a person's activity profile that induces peak productivity in whatever activity a human is engaged with. This feeling can happen anytime in the middle of an activity momentarily elevating performance. The difference is that self-actualisation is not a pyramidal apex of human needs but a pyramidal feeling in an activity profile that may happen to anyone any time depending upon his or her productivity profile at any level of the pyramid. Self-actualisation still remains a sign of well-being because without the feeling of well-being, one cannot be self-actualised. It is therefore an indirect measure of well-being that will reflect in an active human⁵⁸. Hence, well-being links with freedom of thoughts which also means freedom of life. Freedom thereby becomes a sign of well-being. It is only in a free moment one's activity strikes the peak—self-actualisation.

⁵⁸Paleri, P. (2018). *Human investment management: raise the level by capitalising human*. Springer Nature Singapore Pte Ltd. p. 81-88

Self-actualisation is the highest level in Maslow's hierarchy of needs. There are two disclaimers here. Firstly, no governance can expect to take the people to that level. Hence, governance in national security is a process theory. Secondly it is important to understand that self-actualisation for the purpose of national security is not just engagement in creative activities for the purpose of freelancing within spiritual security in the absence of perceived security. It is the transcendence to self-actualisation within apparent security. Such self-actualisation is an indication that governance is effective. From another point of view, it can be said that it is the state when the survival instinct does not affect the individual motive of self-actualisation and thereby creativity. This sums up the definition of national security as a concept that denotes the well-being of the populace of a nation that includes its domestic and geostrategic prosperity, in which the strength of that nation is seen against the multidimensional threats faced by it at any given time. Once the concept of national security is identified as a measurable quantity and a function of time, it could very well be indexed. Such indexing will give rise to the NSI. The NSI will be a sliding index with respect to time and will need serious research for indexing and identifying appropriate parameters for accuracy. Once the NSI is assessed, it will be easy for comparative analysis of nation states in the world and for internal evaluation related to progress of a particular nation state that could be audited by the people themselves. The NSI could be a reliable and intelligent index in assessing the state of a nation at any given time.

At the end national security can be defined (Box 3.4), but indexing it will have to wait for calibration and validation (Cal-Val) (Box 3.4) of metrics and consensual acceptance of the concept.

Box 3.4 Cal-Val in National Security

Calibration and validation in national security is for incorporating indexing and associated metrics in national security studies. It will be a complex issue but considered pragmatic and useful in the long run in the later years of evolution of the concept. This will standardise and streamline the process of national governance appropriate to the human system characters. In this effort many other indexing systems in vogue may get replaced. There will be a variety of agencies, with different mandates, cultures, and political appropriators involved in such indexing globally. Yet the stakes are very high in terms of public governance. The problems will be only in the initial stages of establishing the NSI. Once the necessity is established, it should become a global initiative similar to any other international collective efforts with national participation (see also 3.7.1).

3.7 Manifestation of National Security in National Governance

The more one focuses in the process of defining national security, the level of its usage in national governance and its practicality can fall victim to the law of limitations. Exploring national security has to be done with care to avoid obfuscation of its practicality by the law of limitations in national governance. The law here is the law of uncertainty or the game of chance where “more” in one limits the “more” in another or rather increases the probability of chance variation in a dependent another. The key aspect of defining national security is to make it useful for practical application which obviously is for understanding governance, implementing governance and engaging in interventions in different terrains as appropriate to the situations and requirement. In this study the sole purpose of defining national security is to make it the single most imperative to human system governance at national level and, if possible, at global level at a time in future. The study so far shows it is possible. But there is a catch. The catch is in its manifestation as a practical concept effective on the ground. Here the ground comprises the terrains that this study will look into detail later this study. This means that besides the elements, the terrain specificity of national security concept too needs to be examined for integration of elements and terrains in national governance.

This need not be the final definition for national security. There cannot be a “once for all” definition for an evolutionary concept. It is only that the author is calling finals for this study and the definition is what has been already identified in 2002.⁵⁹

3.7.1 Indexing National Security

The ultimate manifestation of national security principles, once accepted universally, should lead the system to a composite national security index in line with other human system indices such as economic indices, developmental indices, happiness indices, health indices and so on. Such an index needs accuracy, finesse, ease of use, transparency, universality and other parameters perhaps better than all other indices for total acceptance. It should have qualities to replace other human indices used for the purpose.

There are various governance indices. One such index in India is the good governance index (GGI). It is a tool to assess the status of governance and the impact of various interventions taken up by the hybrid sectoral governments in India⁶⁰. The primary objective of GGI is to provide quantifiable data to compare

⁵⁹Paleri, P. (2002). “The concept of national security and a maritime model for India.” *Doctoral dissertation*, Department of defence and strategic studies, University of Madras, India.

⁶⁰Mix of federal and unitary system. The constitution lists separate Central and State responsibilities as Union List, State List and Concurrent List.

the state of governance in all states and union territories of the country. India has enduring experience in constitutional democracy. The GGI can be a model for national security index.

An understanding of Indian democracy can go well in perceiving a national security index in its entire firmament. According to researcher and scholar Hiroaki Shiga, the Indian Constitution was virtually the first constitution designed to tackle the challenge of building a thriving democracy, coherent nation and functioning and legitimate state *simultaneously*.⁶¹ It succeeded in this as its existence so far proves since its adoption in 1950. It is a matured constitution belonging to of a responsible country. The constitution was deliberated by expert framers aware of the danger of failing to create an “Indian” nation and democracy and the dismemberment of the state. It has a well-balanced hybrid of imported and indigenous components, and it opened up an “innovative period of alternative constitutional arrangements shaped by the difficulties of underdevelopment and cultural diversity” (Klug 2000: 11). The constitution introduced the parliamentary system of its colonial master, whereas the Bill of Rights was adopted mainly from the constitution of the United States. In contrast, affirmative action measures to empower minorities and the poor were largely home-grown. For example, PIL was created and developed out of a series of case law formulated from the judgements of the Supreme Court of India.

Another important factor is that Indian constitutional democracy has survived under the inhospitable conditions of multiple ethnic, religious and cultural cleavages and a hierarchical social structure. The Indian Constitution has been exercised almost uninterruptedly since its adoption in 1950. The only interruption of Indian constitutional rule was the 21-month period of a State of Emergency from June 1975 to March 1977 when the government declared “Emergency”. Indian democracy, the largest in the world, demonstrated resilience in spite of shortcomings in governance when emergency was declared. Hewitt observed that the sheer decisiveness through which the Indian electorate reaffirmed its commitment to an elected parliament (during emergency) gave the event widespread international coverage and became part of the mystique of India as the world’s largest democracy (Hewitt 2008: 13). The separation of powers functions well, and the Supreme Court on occasions was bold enough to declare parliamentary laws to be unconstitutional and thus null and void. Public interest litigation (PIL) is actively utilised in favour of the marginalised. In this sense, it would not be an exaggeration to argue that India is virtually the sole example of a developing country that has been operating successfully under a constitutional democracy for such a long time. The prudent structures of the

⁶¹ Shiga, H. (2018). India’s Role as a Facilitator of Constitutional Democracy*. IDS Bulletin. Vol. 49 No. 3. <https://bulletin.ids.ac.uk/index.php/idsbo/article/view/2982/Online%20article>. Accessed 31 January 2020.

Indian Constitution and its long-standing and vibrant implementation have raised its status to one of the most studied constitutions in the world (Khilnani, Raghavan and Thiruvengadam 2013: 12–13).

3.8 Summation

The concept of national security remains ambiguous in spite of being evolved from simpler definitions which emphasised freedom from military threat and coercive and subversive military politics. In the advanced world as it is today, national security may be understood as an evolving concept pointing out at human well-being by governance where people can live in freedom and dignity. The concept is expected to change for the better being an evolutionary process as time advances.

The evolutionary path to the present-day concept of national security began in the human systems of yore (not called nations then but had defining boundaries as system identities) much before the origin of nation states. National security is the apparent physiological, mental and emotional well-being of the people of a nation, defined accordingly as a measurable state. The apparent security goes in tandem with perceived security in which a government cannot do much except avoiding adversarial indulgence and encouraging freedom of survival under belief systems. The word “nation” may be a misnomer or ambiguous in its early evolutionary stages, but when conjoined with security, the meaning ends up with the human system definable and identifiable as governable for the well-being of the people. Today people live in identified nation states, the largest formal human systems in the global context, as citizens with demographic rights. The discussions in this chapter about the evolution of national security are not strictly along a timeline format or an inkblot model but in a staccato presentation highlighting key waypoints in short spans of time. The proposed suggestions in this study are apropos to the modern period of the twenty-first century where humans could become more responsible as the new-generation sapiens with a serious shift from the military posture as providers of care, comfort and freedom to the fellow humans. It also means military and non-military security has lap dissolved into national security as a unitary concept with 16 internecine elements operating in eight different terrains that is being examined further. At the end it is important to know that the study of national security will remain continuous. Table 3.1 progressively highlights the evolution of the concept.

Table 3.1 Evolution of national security concept

Origin		Definition dilemma	Constituent elements	Elements identified for examination
1	Prehistoric	Survival	Physical security	Muscle power
2	Hunters	Survival	Physical security	Muscle power, primitive weapons
3	Epics	Survival	Physical security	Campaigns
4	Spirituality	Supplements needs in the perceived security gap	Mental aspects for existential balance	Religion and inner self
5	Sovereignty	Westphalian nation states (1648)	Right to and of sovereignty—initiation	Wheel over point from past course to the present line of advance in the national concept
6	Yale University undergraduates (1790)	Earliest reference to the term national security	Fostering domestic industries	Non-military security for military security
7	Adler, Alfred (1870–1937)	Apparent security	Communal living	Organised protection
8	Maslow, Abraham (1908–1970)	Hierarchy of needs	Physical and psychological needs	Existentialistic deeds
9	US Senate (1945)	Security is not just defence	Other than the navy and army	Non-military aspects
10	NSC (US) (1947)	Flexible for wider use	Value-based protection for freedom	Military and non-military
11	Lasswell, Harold (1950)	Balancing instruments of policy	Arms, diplomacy, information, economics	Military and non-military
12	Wolfers, Arnold (1962)	Absence of threats and fear	Value-based protection	Military and non-military.
13	IDSIA (India) (1965)	Ambiguity	National defence and national security	Military and non-military
14	International Encyclopaedia of Social Sciences (1968)	Power to protect external threats	Value protection	Military and non-military
15	Blair, William (1972)	Dependency on economics	Balance of payments and foreign assistance	Non-military
16	Moss, John (1973)	Ill-defined phrase	Freedom of information	Non-military security
17	Yale Law Review (1976)	National military capability	Military to protect interests	Military security
18	Brown, Lester (1977)	Non-military	Energy, environment, climate, economy, illegal immigration, food	Non-military security

4.1 Introduction

Four terms, critical to decision-making, are cited in the title: threat, risk, uncertainty (TRU) and chance. They are widely used in daily expressions from personal lives to national and global governance. The specificity and separation of these terms need fair introspection and “how to” thinking before application and usage. Otherwise they may not be appreciated clearly. Worse, they could get mixed up, one with another. Such strategic cocktails can result in awry decisions.

Human personality is projected in his or her behaviour with respect to a situation that is decided by the time of occurrence. The behaviour can change for a similar situation at a different time. The personality changes not only periodically but mixes with the society even after the individual is gone. That is worse for the living because their original behaviour will be modified by those of the dead and gone by superimposition confusing the issue totally (Footnote 71, Chap. 1). Superimposition in behaviour kills original thinking, though it may make it easy. Humans have no other way. But at least they should understand it while making decisions. One loses originality by following an unoriginal another. One gets clichéd. Dead humans walk and induce decisions in every human system through history, legend and myth (even the dead changes its personality in time) modified into rituals, traditions, politics, ethnic behaviours of all kinds and what nots. So everything about what a human does has the behavioural aspects behind it. The author views the threat, risk, uncertainty and chance (TRU-C) about to be explained in this chapter a kind of human intellectual illusion that is present and not unreal. They could be intellectual aberrations constrained by the law of invariance and the law of limitations in human thinking. But humans have to face them as long they are not unreal and present. This calls for a bit of discretion while going through the rest of the chapter. Self-guidance is needed.

The four terms, threat, risk, uncertainty and the all-pervading chance, are exclusively different from each other in the standard usage. But they can come together and torment and disorient an active strategist or planner. They can also disguise as each other like witches and warlocks in fairy tales or mythological “what-it-is-nots”¹ by disorienting decision-makers. These terms are decision accelerators (Box 4.1) in governance. Therefore, they need to be distinguished clearly and appropriately in a decision model. Though separate they come together in a triad of threat, risk and uncertainty oiled in chance. Deadly and mischievous!

Box 4.1 What Are Decision Accelerators?

Decision accelerators are the forces that make a decision fastidious, often crossing the limit defined by critical time, when a decision is most appropriate. Most of the policies and plans overshoot critical time because of the pressure of decision accelerators, not inertia. It is like getting swept away uncontrollably in a flood stream. So, what should a government look for under the force of decision accelerators? Something to hold on until the accelerator is contained or apply it to advantage.

Threat exploits the vulnerability of the target. That’s what generally talked about threat. What does it mean? It assumes a target is vulnerable to threat all the time. Can there be a target that is not vulnerable at all? No, according to this statement and what

¹An expression chosen to explain a communication that is acceptable with the understanding as something that is not true in real sense. Say, “It is what it is not”.

this book intends to repeat is that a target is not a target unless there is a threat watching it. This makes the target vulnerable. The vulnerability of the target comes when it assumes the position or the existential paradigm of a target. Vulnerability does not attract threat. Vulnerability is caused by the threat attraction that makes the entity a target in turn. This is the assumption for decision-making in target-threat relationships. Threat and target are mirror images. In fact they can assume the position of each other relatively—threat can become target and target can become the threat relative to each other's aspect. This statement is hypothetical as the fact remains that the threat and the target annihilate or destroy each other at the same time. A better and more poised word will be “nullify”. There is no threat unless there is target and vice versa. In the language of chaos (theory), the target is anything that is threat attractive. Here, vulnerability is not an element or a modifier. Where there is a target, there will be a threat homing on to it and vice versa. A prospective target invites a threat to develop itself into a target. In the reverse, it can be said that a threat creates a target. Well, not exactly. A threat finds and tracks the target which is in coexistence to it autonomously. Something is wrong in all these statements. That is the better way to appreciate a threat and the target relatively.

In the present context, it can be better said that threat and target are inseparable. They do not stand isolated even if distances apart. They form and subsist together under a kind of mutual dependency. They need each other to exist. The encounter of both is expected to end in mutual disappearance or destruction. Threat vanishes when target is disseminated. A threat will also vanish when the target is destroyed by another threat homed on to it. The threat need not be singular. It can be in multiple profiles. The identity of a target remains in its ability to remain threat attractive without getting unconditionally extinct. The target in this case is the energy factor. A highly threat-attractive target possibly can do much more to the system in which it exists than a lightly attractive one if threat is managed well. But, of course, the targets cannot be classified in that way; secondly the quantum of threat attractiveness of a target is time functional. This way it can be said that a “threat” is anything that is a possible “visitor” to a target (Box 4.2).

Box 4.2 Can a Threat Be also Creative if Considered a Visitor to Target?

In the conception of threat as a visitor in the larger sense, a threat is also a prospective good giver relative to the target. It can be called positive threat for the time being, though not exactly so. With a bit of forward thinking, don't humans in business make products consumer targets in one way or the other? One may call it marketing based on consumer psychology. In the study of national security, a threat is seen as a destructive offset. Using positive threat is not explained here though applicable in governance. It is a matter of converting threat into an opportunity.

The threat and target can be made distinguishable by assuming the idea of individual supporting systems. For example, a threat needs an agent, threat agent (TA), which is a combination of supporting systems engaged in creating it. The threat agent creates the threat that immediately turns the “short-living” non-target system to a target.² The result is mutual existence. It is interesting that a target (with the pointed threat) “survives” longer than a non-target (where threat is absent) (Box 4.3). A non-target thus has a much shorter half-life ($t_{1/2}$) in physical balancing terms. This explanation is shortened here to avoid deviation from the topic (Chap. 11).

Box 4.3 Why a Target Lasts Longer when Under Threat?

A dynamic system should last longer in vitality than a static one. To remain dynamic a system should remain threat attractive. A system should not be unduly concerned when under threat because it will be all the time cautious about it. A static system can be affected by creep and fatigue faster than a dynamic system.

The protection or handling of a target from threat is a complex issue that needs intervention of the target minders (TM). Target minder is anybody, organisation or agencies associated with threat management and target protection. The TM understands a threat (Box 4.4).

Box 4.4 At the End, Please Note a Threat is not a Threat as Perceived

A threat is a changer as well as a preserver. It retains the target dynamics. Threat can be prevented, pre-empted as mentioned earlier if destructive, but can also be turned round constructively under special situations.

Then what is **risk**? Risk is not the attractiveness of the target but the prospectiveness for loss in the management or governance of the target. Loss can be in many ways, the ultimate being the constructive total loss (Box 4.5). That is when the last of the constructive gain in loss is shattered. Loss happens when threat exploits the attractiveness of the target. The exploitation can be natural, accidental or purposeful. Risk, thereby, becomes the situation where there is a credulous or astute exposure to danger. It is a case of make or break. It is a kind of single-player

² A non-target system in a dynamic environment has a very short half-life. It means it will turn into a target urgently as threat is waiting to happen to make it dynamic. The food that slips to the ground is no more edible because of the accumulation of bacteria urgently. (Well, there said to be a three second rule. . .but not relevant as an example.)

two-sum game—one could be a winner or loser in the game of risk, nothing in between. To think of it, the whole life is a uni-player³ zero-sum game—risky.

Box 4.5 What is Constructive Total Loss?

Constructive total loss in this study is the loss from which no fresh gain can be achieved, whereas in legal language, constructive total loss is when the sale value of an asset falls below the cost of making it saleable. In governance constructive total value needs to be assessed situationally through value engineering and other available methods as a decision process.

The third frame of the triad is **uncertainty**. It is neither risk nor threat. Similar to them, uncertainty is also situational. It is a human intellectual limitation that is also time functional. But the situation will be epistemically conditioned. Uncertainty is when there is no knowledge of things that may or may not happen. It is a kind of logical black box where entry is prohibited. The moment of entry breaches the black box diluting uncertainty. Uncertainty is when things are not certain. It is a limitation under the law of limitations. “One doesn’t know but needs to make a decision”—a confirmation of what next, without knowing it—a shot in the dark or a temporary lethargy of not wanting to know as visiting a “long time no see” friend in a faraway place without knowing he or she died some time back or shopping for a product not in stock that one comes to know only at the counter. In such case uncertainty is caused by information deficit. Humans have a knack of working under uncertainty. They seem to like it, though quite demanding at times. Uncertainty principles originate directly from physics, the controlling science of everything (Box 4.6).⁴

Box 4.6 Uncertainty—What (Quantum) Physics Says?

The uncertainty principle in physics says there is fuzziness in nature. It elaborates the fundamental limit to what one can know about the behaviour of quantum particles and therefore the smallest scales of nature. What is good for physics is also good for nature. Fuzziness is also linked with chance. Here is where one should shift from the usual “yes-no” Boolean process (loves me, loves me not) to fuzzy logic in decision-making based on the sliding “degrees of truth” between complete truth and complete falseness.

As mentioned, uncertainty is associated with the decision-makers’ behavioural aspect too. Human survival emotions such as anxiety, stress and so on can induce uncertainty in decisions made. It can be threatening but is not a threat in the true

³ A term to mention single-player zero-sum game which is not a part of game theory but exists in the case of handling unknowns in governance and even life as a whole. The so called “risk-takers” are uni-players in a zero-sum game—“win I rise, lose I fall”.

⁴ Author’s view

sense as it is also not a risk. Decision-making under uncertainty is not similar to decision-making under threat, risk, competition or conflict. Uncertainty can be limited by making things as certain as possible through information acquisition and intuitive thinking where possible. Decision-making under certainty is the easiest of all decision-making processes. Decisions under uncertainty may follow the route making uncertainty as certain as possible. This is the basis of information system design and management. Decision-making under uncertainty demands the ability to wipe out the fog from the windshield of time to make it as certain as possible with information (Box 4.7).

Box 4.7 Is Life Uncertain?

No, if one applies the intellect to see through time. But yes, if taken as a shot in the dark.

Threat, risk and uncertainty are associated with an incredible goblin that lives inside the castle of time—**chance**. Chance, the goblin, is childish, naughty, funny, comical, mysterious and, sometimes, quite a nuisance. It can be very helpful too. Chance is the possibility of something happening. Interestingly, chance skips cause from the conscious—the possibility of something happening. That makes it happen by chance—unexpectedly. The world is chancy. Chance plays around with threat, risk and uncertainty. Rather, chance enjoys it as long as the godfather of all permits it—time and its associated behavioural relativity of humans. They are further peeped through.

The introduction has been long but it is anywhere from completion. But the limitations of this study would like to seek explanation of each element in the triad of threat, risk and uncertainty and their facilitator, chance, to be examined separately and briefly.

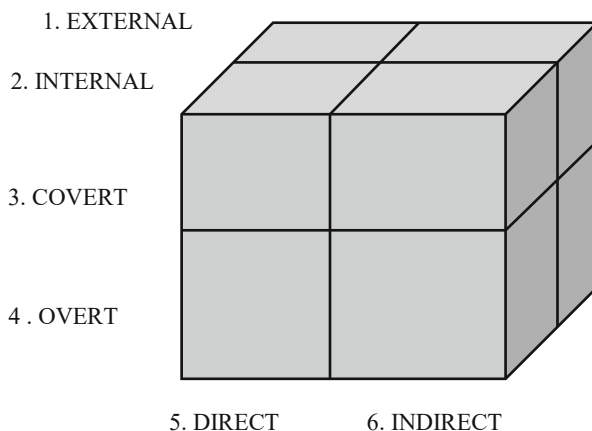

What is important to know is that all the four are played in the mind, the sapiens mind, and they are different; any similarity is incidental and, of course, caused by the mind.

4.2 Threat and National Security

Threat is real and present in a human system, all the time. A human system comprises individuals and groups. Threat is the force positive⁵ that harms an individual or group actively or passively. It is universal. It may not be apparent, though. Threat, however insignificant it is, remains delusive and overcast most of the

⁵Here, threat is the force positive, the expression of a dominant power that exists, whereas a force negative is a threat perceived under anxiety. Force positive is real and force negative is unreal. Governance should be devoid of force negatives in the decision model.

Fig. 4.1 The threat matrix cube (Paleri's Cube (For usage while referring to or comparing with any other threat perception models))

time. It causes certain vagueness in threat appreciation. One has to probe further to clear the misty general appreciation to comprehend the threat to act on it.

A nation should have the capability to identify and prevent the threat or threats from hitting the “target” and the awareness that this alone will not be sufficient in maximising national security. The deluge of threat is all pervasive even after it hits the target and gets self-disseminated as it leaves a host of chain reactions behind. Generations of people will fall in the chain and bear the brunt of actions of centuries-old governments and dealings of their forefathers only to repeat the game as part of the chain.

Unless, a forewarning of threat, more than the anxiety associated with life, ignites the process of threat perception and continues till the threat is disseminated, destroyed and attenuated or the target is displaced from its path. This will be based on the appreciation of the approaching danger or harm—the threat. The anatomy of a threat is multidimensional and can be identified even if invisible and abstract. The dimensions of threat can be examined in various models. It doesn't stop there. The ever-changing intensity of threat on its path also matters.

4.2.1 Threat Matrix Cube

The author prefers to analyse threats within the three dimensions of a cube—the threat matrix cube (TMC) or Paleri's cube for comparison with similar others shown in Fig. 4.1.⁶ The three dimensions produce six existent opposites in eight cubical dimensions of threat perception:

⁶Paleri. P. (2002). “The concept of national security and a maritime model for India”. *Doctoral dissertation*, Department of defence and strategic studies, University of Madras, India. pp. 60-61. First introduced in the book, “The role of the coast guard in the maritime security of India”, by the

- (a) External and internal (2)
- (b) Covert and overt (2)
- (c) Direct and indirect (2)

While the types of threats as per the cube are real and present, the degree or intensity may vary with respect to time and so the preparedness level to face it. Accordingly, the search for a definition of the type of threat and its intensity should begin by identifying and relating it with the TMC. The perception of threat is a variable and a function of time and situation. A threat, therefore, is a vector quantity with intensity and direction in time. The intensity can vary and direction can change with respect to time.

In the cubical analysis, a threat appears as one or more of the eight multidimensional cubes. Once identified cubically, observation of threat become a continuous activity. The key aspect is measuring the intensity and changes in the direction of threat. Preparation to protect the target from the threat commences here and should move on simultaneously. Identifying threats to elements of national security is the function of the government through various agencies and machineries under it. The greatest danger is misperception of threat, which occurs when diagnostics go wrong. Cervantes (1547–1616),⁷ the seventeenth-century author, had hinted at the consequences of misperception of threats and wrong targeting through *Don Quixote*, the character immortalised in the classic satiric novel by the same name.⁸ The fictional novel belongs to the picaresque category of literature. In the novel, the character imagines himself as a knight out to help the weak and the scrawny and gets into chivalric acts in a scenario where threat perception was either totally absent or distorted. It may be a spoof of the period, but the fact remains that the Don Quixotic tribe still thrives around the world in positions of authority. Some are of course smarter; they conveniently and deliberately misconceive the perception for, what Barry Buzan had stated, “power maximisation”,⁹ not national security maximisation.

Often, planning for threat response is based heavily on misperception and appreciation based on imagination. This is a chink in the armour of global security. The perceptual differences have a lot in common all over the world and mostly because they are guided by imagination rooted in economics and power governance. Hence, the agony is associated with inertia in national security. Its momentum gets arrested by deviation or static inertness.

A threat will have a point of origin. It will be a location most favourable to it. The location may be calm and deceptive under the control of threat generators. It will be a

author, researched under the Indian Ministry of External Affairs chair for the United Service Institution of India in 2004. p. 25

⁷Miguel de Cervantes Saavedra was a Spanish novelist, playwright and poet.

⁸Encyclopaedia Britannica, CD-Rom, 2001. Miguel de Cervantes Saavedra wrote *El Ingenioso Hidalgo Don Quixote de La Mancha* (“The Ingenious Hidalgo Don Quixote of La Mancha”; known as *Don Quixote*, Part I). It was published in 1605.

⁹See Chap. 3, Table 3.1.

perfect place for the threat to bloom—the threat nursery. Anything or anybody could be a threat generator, even nature. Every threat shapes up in one or more locations conducive to it.¹⁰ The threat could sustain at multiple locations in a chosen terrain. Here, the threat is seen as a single concept. There could be multiple threats that may attack the target at the same time.

Irrespective of threat generator, a threat is capable of causing harm to a target. In national security, a threat could dislocate human life associated with the target. Another important aspect is that the locations—the points of origin, in the case of multilocations—could proliferate at different times. All of them may not come up at the same time. Some of them may be centuries old as could be seen in geostrategic, border security perceptions and various other disputes and conflicts from families to global formats.

4.2.2 *Typology of Threats*

The cube model identifies three classes of threats: 1) direct or indirect, 2) overt or covert and 3) internal or external. A **direct** threat indicates the direction of the threat in a straightforward manner. Even an **indirect** threat is easy to appreciate with respect to its direction to the target. An earthquake-prone island in the ocean can induce an indirect threat of a tsunami in the direction of a far distant land across the ocean. The earthquake that generates the tsunami is a direct threat to the island in situ. This rational logically applies to all threats.

The next category belongs to the overt-covert class of threat. An **overt** threat is easy to identify. They are non-deceptive, hence known in advance. **Covert** threats are deceptive. Covert threats should not be considered as threats that are unknown. They are executed without the prior knowledge of the target reticently. It is a threat that is planned covertly.

The term external-internal denotes the relative position of the threat with respect to the target. **External** threats are those coming from outside the target system boundary. **Internal** threats are from within the target system. Subversive activities in a social system could come from within as well as from outside or combined.

A threat at any given time will normally be in combination of the other two ingredients of the group—risk and uncertainty. Within these complex parameters, the threat has to be identified and appreciated for countermeasures. The choice of counter measures is laid by different perceptions and parameters assessed by the threat managers. The government is the threat manager in national security governance. This way the government also functions as the target minder.

¹⁰In this example, the eye of the storm should not be misconstrued as the location from where the storm develops. It is just a metaphor to point out the calm and secrecy that prevails at the location from where a threat originates. A threat needs such a place to grow. Pre-emption means locating and destroying this position or preventing it from establishing itself.

Fig. 4.2 DCE threat cube

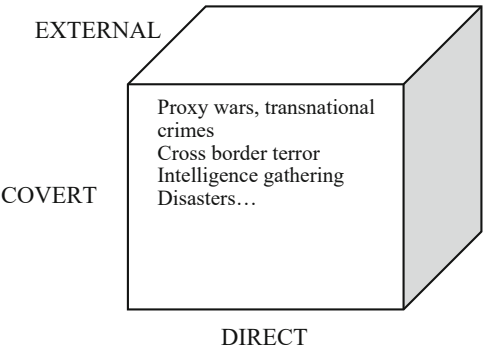

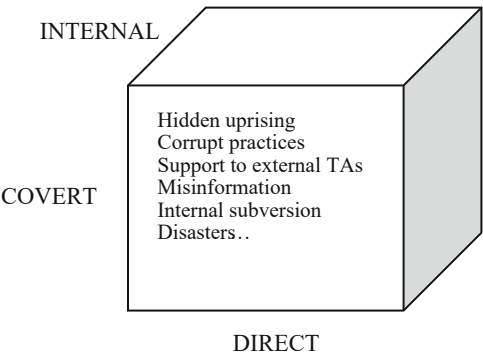

Fig. 4.3 DCI threat cube

The eight cubical dimensions of threat can be seen individually by separating from the main threat matrix cube for dynamic analysis in national security studies. Figures 4.2–4.9 show them.

4.2.2.1 Direct-Covert-External (DCE) Threats

DCE threats approach the target surreptitiously from external to it. The threat agent (TA) manages the threat that could be compared, for example, with a Trojan horse under deceit, silence and many other modes. The approach is under deceit and secrecy. The operation of covert threats demands stealth on the part of the threat agent (TA) and intelligence and knowledge to understand the “intention” of the TA on the part of the target minder (TM). The DCE cube of threats is given in Fig. 4.2.

4.2.2.2 Direct-Covert-Internal (DCI)

The DCI threat is hidden. The TA is secretive, and the TM will have to unfurl the secrets taking advantage of effective and actionable intelligence machinery. Closer

Fig. 4.4 DOE threat cube

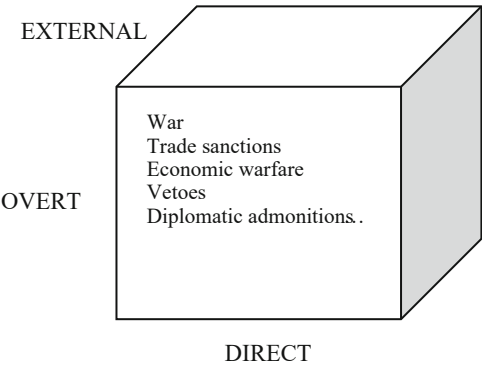

Fig. 4.5 DOI threat cube

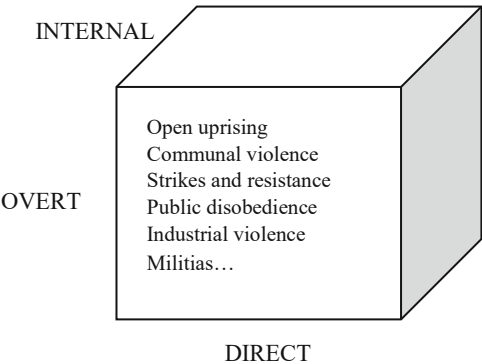

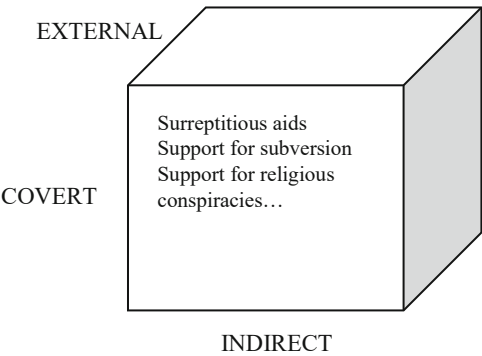

Fig. 4.6 ICE threat cube

to the target during the final moments of approach, the shades of covertness may turn overt at times. Except then, the threat cannot be directly identified. But the actions aimed at overt threats (DOI) could have an effect on the covert factor, if it has a relationship with the former. In other words, most of the DOI threats have their buddies within the DCI threats. The measures advisable for both are pre-emption in governance rather than countermeasures after the threat breaks its static inertia.

Fig. 4.7 ICI threat cube

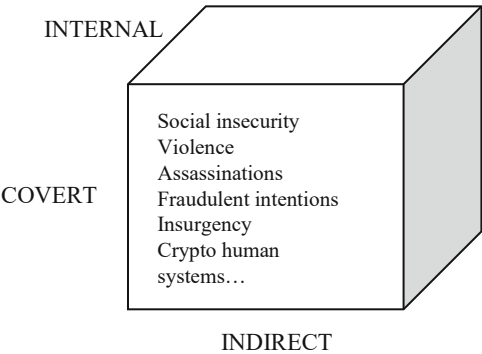

Fig. 4.8 IOE threat cube

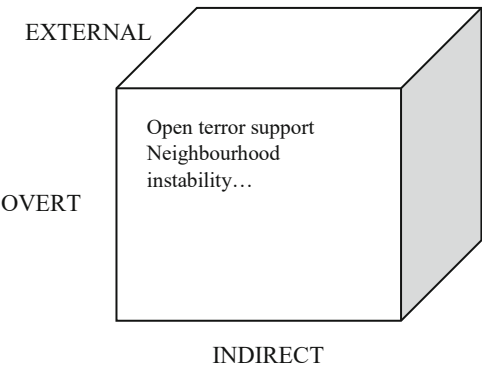

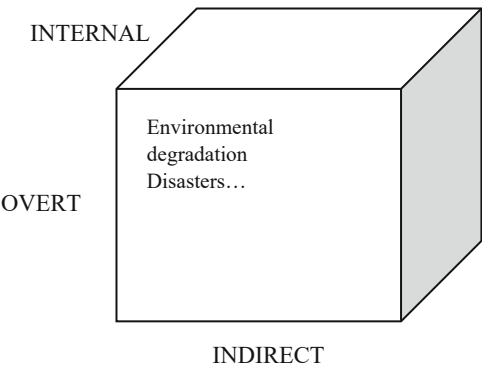

Fig. 4.9 IOI threat cube

Thereafter it becomes a prolonged affair, often very damaging. In colonial parlance, the strategy of “divide and rule” falls under this category. The DCI cube of threats is given in Fig. 4.3.

4.2.2.3 Direct-Overt-External (DOE)

These threats are external to the system. War, terrorism, sanctions, etc. are examples. These are the most prominent and frequent threats to national security. The world has been reeling under them. The United Nations lose sleep over them without knowing that it is neither an insular nor a unified entity. Unfortunately, the world is yet to wake up to the truth that “we are the United Nations, not they”. The DOE threats get diluted in the national political identity as well as the United Nations’ diluted identity when its power partners criticise it. It is considered to be an external organisation even by those who stake claim in it when situations demand for action. The DOE cube of threats is given in Fig. 4.4.

4.2.2.4 Direct-Overt-Internal (DOI)

DOI threat is direct to target and very explicit. The origin of the threat is from within the system. The motives and intentions are known to effective intelligence or information machinery. The TA is confident to hit the target, or it may be an ongoing issue that may take a long time. Being explicit also gives certain degree of acceptance by the people in governance. There will be rationalisation as well as politicisation of these threats. Besides, these are natural threats that may not be uprooted from society. It will continue since the psyche of the people accepts them to a certain degree interpreting from a rational viewpoint. There will be a sense of acceptance to live with such threats. In national security, such threats are better pre-empted. Countermeasures are not likely to be effective besides being prolonged and costly. The DOI cube of threats is given in Fig. 4.5.

4.2.2.5 Indirect-Covert-External (ICE)

Threats that are indirect as well as covert may seem strange. But in reality, they are too frequent and many. Internationally, geostrategic domination mostly relies on indirect methods often covert. They are external to a nation. Foreign aids and other acts that demand obligation from the beneficiary form part of such threats to national security. Deception in diplomacy and fraudulent attempts through other entities or media are examples. The ICE cube of threats is given in Fig. 4.6.

4.2.2.6 Indirect-Covert-Internal (ICI)

ICI threats are not easily identifiable. Social insecurity, simmering discontent against a system, industrial violence, communal riots, etc. are examples of threats that are indirect and covert, at the same time internal, provided there was no external support. It becomes hybrid or multiple when there is external support linked with the threat.

This is a dangerous situation. The political and business scenario of a country often faces such threats. Political leaders can become victims of such threats in an election where they expect to win. The ICI cube of threats is given in Fig. 4.7.

4.2.2.7 Indirect-Overt-External (IOE)

Unrest in the neighbourhood country, a pandemic of biological microbes or a raging forest fire across the border, such threats can always impact national security. Here the threat is external and overt but indirect. A breach in a dam can cause flash flood in the neighbouring country. It is a threat across border, hence external. The IOE cube of threats is given in Fig. 4.8.

4.2.2.8 Indirect-Overt-Internal (IOI)

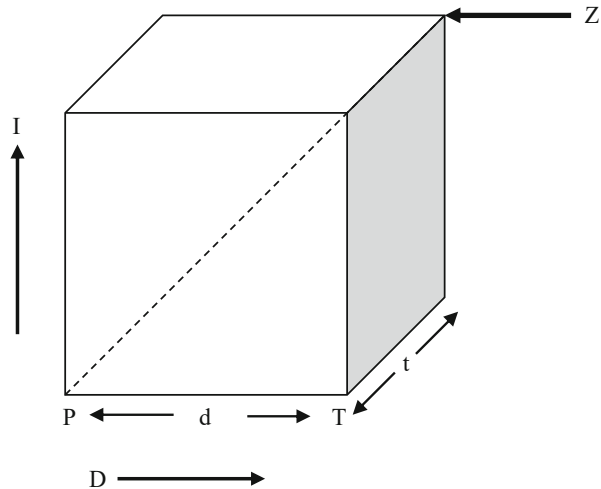

The IOI threat is indirect, at the same time overt and internal. A general strike called by a union that would affect a nation's economy or violence caused by people running amok riotously during peace march in a braking spree of public and private properties, etc. cause indirect but overt threats internally. The IOI cube of threats is given in Fig. 4.9.

Threats can hunt anything and everything at any given time. The no-target situation doesn't arise in national security. The target systems balance under threats in national security. The threat managers have definite tasks of yielding results to maximise national security under such scenario. It is turbulent and agitated all the time. Though the nature of all threats is identical within a common model, the models given in figures above are for a few threats that will challenge national security governance. Most of the threats come in combined or hybrid formats. For example, cross-border terrorism or industrial violence can be covert as well as overt. Threats can be protean in nature, changing shape frequently.

4.2.3 *Threat in a Cube: Flybox Analysis*

First, in this study, it is important to understand a flybox is not a flybox as in its original meanings related to fly fishing or the insect boxes curious children keep with their collection of dead or alive flies and insects as part of their nature studies. It also has nothing to do with the fly that some people keep open for, maybe, more air circulation down there. Flybox in this study is the cube in which the threat and target mutually exist, reside happily and spend critical time before the final meeting and mutual destruction or get dispersed out of their status of identity before encounter. Yes, the flybox in national security studies is the imaginary cube where the threat managers keep their live target and threat in each case and study them—not all, of course.

Fig. 4.10 TMC analysis—flybox approach

It is a three-dimensional plot to understand the relative positions of the threat and target at any given time. The threat perception cube given in Fig. 4.10 as an example belongs to one of the eight cubes of the TMC. The target and the threat are “inside it”, like a fly in a glass cube. This example (the flybox approach) is important to understand the concept. The fly is the threat; it starts from a point and, then, unlike a real fly, is expected to settle only on the target, often aimed at its centre of gravity, after a lapse of time, short or long. Assume the point from where the fly will start is a filthy sewage gutter and the point where it will sit is the target (sugar spot or a birthday cake) it is searching for. In the figure, the point from where the threat will start is “P”. So far it is fine.

For further clarification a threat can be assumed to start from its point of design or origin that the threat agent occupies. The target under the target minder becomes active from this moment on.

At this point it is important to understand that a threat needs at least one target, without which it cannot exist. (The concept that a threat cannot exist in the absence of a target is quintessentially important in understanding the approach.) A target is an essential requirement for a threat to survive. It ideally ends in mutual destruction or the destruction of the threat at the end of it, if it fails to hit the target. The location of the target, therefore, has to be considered the maximum distance the threat has to travel, the point “Z” in the figure at the moment of threat origin, the starting point. It is the target that will encounter the threat (when the fly sits on it) at the end of its journey inside the flybox. It is called engaging the target from the language of the threat. (In military vocabulary, a threat is considered the target in the attack mode where the target is to be acquired before engaging it.)¹¹ The path the threat will adopt

¹¹The readers preoccupied with military concepts will find certain difficulty in understanding the concept at this stage, because in such cases the threat is often referred to as the target—acquiring the

need not be linear in time. When deciding the preparation of the cube, the position of the point of the target is at the diagonally opposite side, the maximum distance from “P”. It is with these points as the baseline the cube is designed to envelop the threat dynamics. Once the points of the origin of threat and the target are fixed, the cube can be prepared and analysed for its eightfold nature.

As mentioned, the threat need not move in a linear mode with respect to time towards the target. That is why the example of the flybox is taken. A fly does not move on a straight line. The various positions in the figure are as follows:

P: Point of occurrence of threat (the threat plane)

T: Position of target (target plane) (the target is assumed relatively stationary)

I: Intensity

D: Mean relative direction (base course of threat)

d: Distance to target plane (threat-to-target span)

t: Time since occurrence (time warp relative to the position of the target)

Z: Hit point on the target plane

P-Z: Threat-to-target distance (in the example)

“P” is the point of origin of the threat. The target is at the point “Z”. PZ is the distance the threat has to cover relative to the three-dimensional plane—the cube, one of the eight cubes of the TMC. There are two planes, one on which the point P is situated and the other on which the point “Z” is situated—the threat and target, respectively. The lateral distance is “d” between the two planes. It is the threat-target span. The threat-to-target span is not the real distance the threat has to cover to reach the target. It is the relative distance. This is an interesting concept. Because there are many threats in the world that have already travelled more than the relative distance in time, the threat-target span, but are yet to reach the target. This can be explained based on the entropy of the system. As long as the entropy of the system (here the flybox) does not increase, the threat will be wandering in its plight towards the target.

A threat travels through the space in the cube, and the direct distance changes with respect to the relative location of the target. The moment the target becomes a no-target, the threat also vanishes without hitting it. The TMC relative to the threat becomes non-existent since the threat is non-existent. It is a kind of abracadabra. This argument establishes the constancy of the threat and the target plane as well as the essentiality of a target as the threat attractor for the threat to exist. For example, a target can be destroyed to eliminate a threat in an ideal mathematical situation. Strictly it need not be an ideal situation. It could be real too. One can see an example in female foeticide¹². What is it after all? It is determined elimination (misunderstood

target, engaging the target, etc. are the terms used in conventional military studies. In this book the threat is different from target. The target is the concept of national security and its various elements. The perception, therefore, needs to be absolutely clear to understand the concept.

¹²Female foeticide is the heinous social practice seen among decadent societies that practice discrimination against women. The term refers to “aborting the female in the mother’s womb”. The cruelty extends even after the child is born resulting in female infanticide—“killing the girl child after her birth”. (See Chap. 20.)

for moving the target) of the “target” (the female foetus) by the deranged (frightened) parents (supposed to be the protectors) to avoid a perceived threat. In such societies a female is a threat attractor! Here the parents (supposed to be protectors) become the threat! It could be more in a complex sense—one can argue endlessly.

The location of the target will always be on the target plane, and the support that the threat may receive on its passage to the target has to come from the threat plane—from where the threat attraction forces emanate.

Similarly, the relative time factor is given by the dimension of the target plane, though in reality, the time that affects the target could be more. It is denoted by “*t*”. The time warps the target and attracts the threat towards it. The threat remains on a variable course relatively in the direction of the target. Attempting to control the time may not be an acceptable proposition in countering the threat. The control that can be exercised, therefore, is limited to the threat and the target. The control over the target is also limited if the target cannot be moved in the target plane to deflect the threat or gain time. The time gained is the time available to engage the threat before it annihilates the target. But the reason why direct control over time is not advised is that the threat can change its aspect in relation to the target and become more complicated. An example is a border dispute. Deflecting a target from the path of the threat may be by temporarily increasing the threat-to-target distance or deflecting the target permanently out of the direction of threat. But it should be understood that moving the target is not always possible; where possible, the target can move only on the target plane. The choice available is either to move the target or destroy the threat by engaging it.

Time can neither be reversed nor kept still. It is linked with system entropy that is irreversible. In a system where the threat hits the target, the entropy is constantly increasing and maximises at the time of hit. Can the entropy be controlled to control threat? What about an attempt to extend the time to target? What is called a (new) lease of time? In select cases these methods could be possible. Often, it is not a determined effort but an occurrence by chance. If it is a chance-induced activity, then is there a possibility of time getting advanced? It could be, at least hypothetically. If that is so, the target will take the hit early. When the threat hits the target, the target would have undergone certain changes with respect to time. Assuming it is the same plain as it was originally, it would be hit when the time is maximum (*Z*). That is when the fly settles on the target in the flybox.

The most important facet that is to the advantage of the strategist is, ironically, the time that cannot be controlled. It can be used to engage the target. The engagement is in two ways: (1) pre-empting—anticipating the threat and engaging it before “it occurs”—and (2) attacking or evading it after “occurrence” before it hits the target.

This, in a nutshell, is the basic model of threat perception. There are eight models, applicable to all types of threats. Each one has its own specific characteristics. The approach is to prevent the threat from meeting the target. But the issue often is not a single threat perception. There could be multiple threats and threats transforming in its character once originated. There are also multiple targets in a system with its vital centre of gravity that needs to be protected. There is nothing more interesting and engrossing than threat chasing. All types of threats to maximising national security

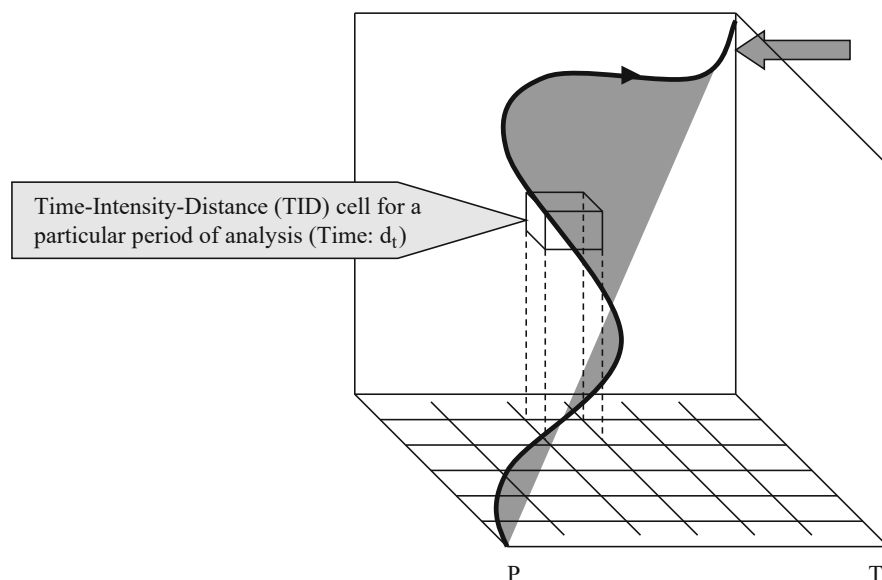

Fig. 4.11 Time-intensity-distance cell for threat analysis—the flybox approach

can be included in these models. Advantage of classifying threats is to understand its nature and clear the perception for remedial measures that could be incorporated as a pre-emptive measure. Therefore, threat perception and analysis are important for any issue related to national security maximisation.

Figure 4.11 is a model to explain threat monitoring under the flybox concept. Under this concept, a hypothetical example is chosen to examine the three factors in threat analysis within the box—time, intensity and distance. The time-intensity-distance (TID) cell at a chosen time on the threat-to-target path in this hypothetical example shows a few parameters that indicate the threat continues towards the target as its relative motion is seen in the shaded area. It is neither gone away nor attenuated as it can be seen at a particular time on its motion in the cell.

The parameters of the cell, at a time “ d_t ” in the figure, are as follows:

- The threat has closed in before deflecting slightly away from the target. The reason for its deflection may vary. The deflection may increase the time to the target.
- The shaded area shows the “advance”. It is more towards the target. The threat, therefore, is advancing to its destination.
- Probability of neutralising the threat is increased since it has moved away from the target. But it is not known whether its speed will increase in the direction of the target countering the advantage available now. It is time to be careful about complacency.

The parameters of the three-dimensional cell where the threat originates can give a direct hint about the threat that sometimes could empirically be used for threat-to-target analysis. In the above case, the threat shows a tendency to build up intensity and also to deflect away from the target. At the same time, its intention towards the target is evident. But there is serious difficulty to appreciate the threat at the time of its origin. Often it is perceived on its way to the target. In such cases, it is very important to see the distance and time left to neutralise it. Identifying the parameters of threat is important to calculate the TID cell indicators at any given time.

4.2.4 Converting Threat into Opportunity

In traditional management, SWOT (strengths, weaknesses, opportunities and threats) analysis (1960s) is one of the recommendations in strategic (organisational) planning. It recommends identifying the four parameters explained by SWOT and handling them to the best competitive advantage in business. The key factors of information are divided into internal factors and external factors. The recommendations here have nothing to do with these traditional methods which business students may engage in their studies and later in practices.

In threat analysis and application in national security activities, the conventional SWOT can be focused from a different perspective as applicable to not only business but any organisation or formal human system under governance. The bottom line recommendations for rebuilding SWOT are given in the following steps:

- Analyse SWOT with respect to the threat manager.
- Prevent strengths from becoming weaknesses.
- Convert weaknesses to strengths.
- Prevent opportunities from becoming threats.
- Convert threats into opportunities.

Simply put, the strategist doesn't recognise weaknesses and threats as they are but as potential strengths and opportunities, respectively. Within this paradigm this study examines converting threats into opportunities being the theme in context. Rest of the SWOT reengineering is not part of this study.

Threat is taken as a challenge to opportunity. Threat is opportunity to experiment and develop. Often, threat can be used tactically to the advantage of governance. A threat creates serious arbiters in politics. War and possibility of war are examples. More political victories are won in the world than actual battles against the background of war. Economy can also flourish under threat. Treating a threat as an opportunity is a way of handling the threat creatively often advisable under win-win situations.

Human ethical standards matter in this process. This is especially so when the global community feels more and more for the future and the generations to come. That is good news within the unitary civilisation. Threat can be converted into opportunity by changing one's perspective, especially that of the threat manager.

A threat can be abused by a threat manager or those dealing with it for gains in an abusive political or religious system. It is the folly of governance. This is well explained in investigations on corrupt practices, where a disaster or threat scenario can be converted to an opportunity for personal benefits of individuals or organisations. Human haplessness which actually is a threat becomes an opportunity for individuals and authorities in power in politics and religion for gains including religious conversions. In other words, someone's threat becomes another's opportunity. But conversion of threat into opportunity is more so for the same threat managers. Opportunity addition in the uni-player zero-sum game is their duty. One of the ways of achieving opportunity addition is by threat conversion.

Ideally there cannot be a no-target scenario in national security governance. The threat agents are ever occupied in creating threats. Threat factory never closes. That is the reason why governance is required without an outage. There is no outage in threat. Threat is ever present. Hence in professionally smart governance, threat conversion too is a continuous process. How many governments are engaged in threat conversion is a different matter altogether. But there are many who do not know or appreciate the feasibility of such an approach. However, that is where the traditional principle of SWOT has to take a backseat when threat conversion process is on. It is a serious task, all by itself.

Converting threats into opportunities is not a new theme. It has been practiced for long in human systems, especially business, by the smart and the clever. In this game plan, walking away from the threat is not an option. The question is, "if threat has to be faced, then why not positively?" This is the underlying principle in threat management. The choice for threat destruction or deflection comes when threat cannot be converted positively. Scholars and experts suggest many methods of threat conversion. All these involve intelligent thinking in the "how-to-think" mode. These methods are to be devised by the threat managers according to their governance policies and then applied strategically and tactically in national security interventions. There are no standard formats for threat conversion. Strictly speaking, threat conversion into opportunities is one of the pre-emptive methods in a win-win mode where the opponent is the threat itself.

All these leave the threat managers in modern times with the first choice of examining the probability of a threat for conversion into opportunity. If identified possible then they may proceed with the "how-to-think" brain storming to reframe the threat. Not all of them can be reframed as opportunities, though extreme optimists will say that every threat is an opportunity. It is not true, but converting threat into an opportunity is a great game plan to deceive the threat agent and thereby maximise national security.

4.2.5 Threat Attraction

As seen already, threat managers may not find an option in converting a threat into an opportunity. Under such circumstances the decision-making process has to move

into the countermeasure phase. Threats have to be faced and destroyed (pre-emption), or the target is protected (prevention) as long as the threat prevails. Here one may conclude that pre-emption is favourable to prevention. But it need not be in all the cases. The target should remain as target if by doing so there are benefits to be accrued. The threat managers, therefore, may consider balancing the target with the threat by prevention for its utility value. Under prevention threat remains active, and as long as threat remains active, the target too remains active as a purposeful target. In the absence of threat, a target becomes no-target and its value diminishes. This is an interesting aspect the threat managers should know. The threat vanishes when it is destroyed or allowed to hit the target. This is a great contradiction. The contradiction highlights the target too becomes non-existent with the threat. Hence the decision should be based on the requirement of whether the target needs to survive as target (for some benefits) or can be disposed of by allowing the threat to permeate into it or deflecting it to another threat. Hence threat management should be handled with reference to the value of the target for the objectives. A government or business may allow a target to be destroyed by a threat if such destruction achieves a larger objective.¹³ That will be a puzzle for the people and even the information suppliers—the media. A target is an entity with form or otherwise with certain qualities or characteristics. These characteristics attract threat towards it. The target is then said to be at certain risk because of the threat. One of the methods usually adopted in analysing the threat is carrying out a risk analysis. Strictly it is a forlorn technique and quite secondary. Risk follows a threat. Risk is associated with the decision in countering the threat and identifying associated countermeasures. Risk analysis may help in insurance premium negotiation or licensing a particular target, but not in understanding the threat in its clear perception, for the threat is a variable and a dynamic vector that changes its intensity and direction periodically in between its course. It can get attenuated or change into a different form. The threat, therefore, needs to be monitored constantly even after considered for pre-emption. The risk is associated fundamentals. Risk analysis is secondary to the threat perception and, therefore, may not help in the objectives, strictly. In effective management of national security, a government should never lose sight of a threat once located. Losing the contact could be extremely fatal. Locating a threat is an art of strategy.

The best way to identify a threat is to study the target thoroughly to understand its threat attractiveness factor and susceptibility. Distinguishing one kind of target from another and recognising specific classes of targets are important. Identifying the elements of national security just does it. Target recognition is the next step in which the varying characteristics are to be accomplished. This is done by observing the target in high resolution in all available dimensions. The idea in maximising national security is strictly in defending the objective rather than attacking another's

¹³ A terror attack that gives a strategic advantage and a union controlled industrial violence that gives a business advantage are transitory examples. The real examples are not highlighted for ethical reasons.

objective. Often the defence is not against an intentional attacker, but those related to natural processes.

In military attacks, the target is recognised and thereafter acquired. Target acquisition locks the target so that wherever it moves, the threat also follows it. In national security, target acquisition is not part of the game plan. It is recognising the targets within and identifying threats pointed at them. The threat thereafter becomes the “target” to engage in the military parlance. The subject of national security does not recommend offensive strategy external to a nation except in attacking threat to national security objectives, because the basic principle of national security and, to that extent, even global security (not definable as global humans is not a definite system), when the concept gains momentum, is creating win-win situations. That is the underlying philosophy that will hold the principles of national security and also support the choices available to the players in the game. Well, opinions can differ and so the results when applied.

It can be seen from a small example. An offshore oil platform is a threat attractor because damage to it can cause a dent in the national security elements. But it may not be in a location where certain threats can reach. In risk analysis, a threat attractor always remains within an area where a threat exists. In the case of a threat attractor without a threat, the government ends up spending on imaginary threat perception. The government is protecting a no-target. The threat attractiveness factor of a target alone need not meet the criteria for the existence of a threat. In normal risk analysis, there is a presumption that threat exists. Hence, threat perception techniques are of better value than risk analysis for cost-effective protection.

Playing down the threat attractiveness factor of a target is imprudent. For an insurance company, profit rings in enveloping insurance cover to prospective threat attractors that lie outside the threat area. It may not be possible because the threat homes on to it irrespective of playing down. Besides, it is more a psychological solution and applicable only in a few cases. Playing down the threat attractiveness depends upon deterrence strategy, camouflaging, secrecy, decoying, etc. It may work but not always. These models are not appropriate in the modern world of information and knowledge. They also talk about the folly of raising the security level in a place under the shock and trauma of a tragedy in another place. It amounts to risk analysis. Elevating security level, etc. are not cost-effective. Irrespective of what may happen, threat perception under threat attractiveness of the target is always the preferred method. It is different from the age-old method of risk analysis and temporary forays into upgrading security perception. The procedure for threat perception is analysing the TMC in its entirety and plotting the position of various threats within it as a function of time under the TID cell in the flybox approach. The time parameters can be changed by inducing countermeasures. Deflection can be either by moving the target or placing barriers around it.

Any process of national security maximisation can make it more and more threat attractive. That also explains the mathematics of proportionately moving target where governance cannot attain eternal and final well-being. Maximum well-being means the concept of national security will collapse once it is attained. It is not possible in a dynamic system, hence limited to maximisation not to total

achievement. The point destination remains unachievable if the system has to continue ever dynamically.

4.2.6 Threat-to-Target Analysis

The philosophy behind this approach is that there is time for reaction before a threat reaches the target in most of the cases. Ideally it varies from fraction of a moment to prolonged years. Threat-to-target analysis is carried out to take advantage of the time available to respond to the threat before it encounters the target. However, appropriate preparedness level is necessary in all such situations. Preparation cannot start after the threat is in motion towards the target in most of the cases, since the time available to engage the threat will be short.

Threat-to-target analysis and interception methods can be analysed equally and identically for a long ranging threat to an element of national security or that of a random case of a house being broken in by a burglar. It is a question of time. The objective is to prevent the threat from reaching the target.

There is a moment in time when the threat originates. The action, thereafter, is continuous unless the threat attenuates or vanishes before reaching the target. The action may be slow, quick or constant with respect to time until it reaches the target location. The object is to interrupt and destroy the threat in this period or to deviate or deflect the threat from the target. These are the only two options available. Collateral damages of the impact of the threat are the prime factor that is to be weighed with cost. In this process, the important steps are detection, analysis of the path and time and response to neutralise the threat or deflect it. Moving the target is also an option. The probability of threat neutralisation depends upon the obstacle that can be provided to the threat on its way to the target. These principles hold good for any situation, any threat attractor and all kinds of threat models. The time periods involved in this calculation are as follows:

- (a) Time to target
- (b) Time to detect
- (c) Time to decide intervention
- (d) Time to respond

The time parameters may change. For example, there will be more time to intervene if the threat is appreciated earlier. Sometimes this time could be more than the time to target. That is when it becomes known that a threat is likely to occur against a target. This adds another time factor: the time of likely occurrence of the threat. In such case pre-emption also becomes a suitable action. The time for pre-emption is the optimum time before threat occurrence. It is the pivotal time.

Modelling threat-to-target analysis will indicate optimum approach solution that will obviate the problem of subjective judgement. Interestingly, even at the highest level of threat analysis, estimation is mostly subjective. That is attributable to various factors: ignorance, political compulsions, external pressure, administrative style,

organisational system characteristics, urgency, opportunism, etc. Politicians or bureaucrats may not find time to carry out threat analysis even if competent. Therefore, there is a requirement of professional threat assessors and analysts to model the threat. Often their findings may also be disregarded based on prevailing bureaucratic policies and political compulsions. That is natural. In any case, there is a need for a mechanism in which professionals carry out threat analysis. Modelling is a helpful tool under experts that will provide optimal trade-off between costs and benefits.

In all these parameters, the important keys are time to target and probability of detection. As the threat moves through the terrain, in many cases, it can also cause collateral damages in terms of cost before it hits the target. Early detection, therefore, minimises cost of damage while on track. This situation demands for regular threat surveillance and monitoring measures.

Cruise missiles like BrahMos fly at supersonic speed. Its speed is estimated at Mach 3, three times the speed of sound at about 1235 km/h. The missile once leaves its pad is a threat to an identified target. Before it leaves, the threat is the human organisation behind it. Pre-emption, here, means preventing the missile to be active. It could mean controlling the threat agent. In the science of pre-emption, the agent that will trigger the threat, the TA, could be contained. In pre-emption, the target—the weapon, in the case of a missile—is either blocked from the threat or eliminated. The choice can vary. Either way, pre-emption is a technique and highly advanced tactical activity that is strictly within the rights and capabilities of those who employ it in target defence. It is also ethically correct. Of course, the onus of proof will be vested in those who pre-empt a threat subject to the approval by acceptance of the international community if it is a military or offensive aspect.

It is different for a tsunami. The speed of a tsunami that may hit a sleepy coastal town could be around 900 kilometres per hour, nearly twice the speed of a bullet train (*Shinkansen*) (2019). In the case of the tsunami, the TA can remain outside human reach. Nor the tsunami could be intercepted en route. But the damage that is likely to be caused by it could be pre-empted by disaster avoidance (preventive disaster) techniques. Here the target is the coastal system including human lives that could be partially deflected from the threat.

An entity (individual or system) becomes a target only when a threat exists. The relative aspect of the threat and target will be closing or parallel. They may not be facing each other all the time, but the ultimate intention will be to collide and annihilate mutually. The TID will keep varying. The encounter will be affected accordingly. Therefore the decision on pre-emption, prevention or hit and mitigation (allowing the threat to hit the target) has to be evaluated and decided in the flybox assessing the decision with respect to the TID cell. This approach is applicable only in strategic planning (Chap. 26). Threat can hit a target without any warning. It happens most of the time. In such case the entity should be clear about effective mitigation. Pre-emption and prevention efforts start before the origin of the threat and ends just before the threat overcomes it to hit the target. Thereafter it is mitigation in disaster parlance. Mitigation refines the chain reaction of damage. Pre-emption is applicable in every aspect of engaging a perceived threat before it

reaches the target. One of the mistakes in threat-to-target analysis is the failure to see whether the target is relatively moving towards the threat. The key element here is the aspect (Box 4.8) of a target in relation to the threat.

Box 4.8 What is Meant by “Aspect” in a Threat-to-Target Configuration?

In a threat-to-target configuration, the aspect is the relative positioning of the threat and the target in the threat matrix situation. The aspect at differing TID (time-intensity-distance) can help in decision-making for handling the situation. The aspects will keep changing in the TID cell. Accordingly the solution too will undergo transformation. This factor is important to understand that threat analysis needs constant monitoring. Threat cannot be easily hedged. That is the reason why a terrorist strike is strikingly effective. That is not a risk or something usually uncertain.

The scenario can be viewed under differing situations relative to the threat-target aspect and TID at a given time:

- (1) Threat and target are stationary—zero approach, neither closing nor opening relative to each other. Awareness of entity becoming a target and accepting existence of threat.
- (2) Target moving towards the threat, threat stationary—approach closing confirmed.
- (3) Threat moving towards the target, target stationary—approach closing confirmed.
- (4) Threat and target are moving towards each other—approach becoming closer.
- (5) Threat and target are moving reciprocally opposite from each other—approach opening out.
- (6) Target moving away from the threat but in course with the target—approach relatively opens out.
- (7) Target moving towards the threat and in course with the threat—approach relatively is closing.
- (8) Target moving away from the threat and not in course with the target—approach relatively is opening out.
- (9) Target moving towards the threat but not in course with the target—approach relatively closing or opening.

In all these situations the threat can hit the target and the target meets the event horizon (Box 4.9) of damage or destruction when both the target and the threat get mutually assimilated. The threat and target absolves each other at the event horizon. The intensity of the threat decides the effects of the target at the event horizon. The entity takes a different format once it seizes to be a target till the next threat appears.

Box 4.9 What is Event Horizon?

In threat-to-target configuration, the event horizon is the point or edge at which the threat meets (hits) the target and assimilates with each other by mutual destruction. The TID cell of the flybox disbands at the event horizon.

4.2.7 Techniques of Pre-emption

Pre-emption of a threat to national security is not always the forte of the powerful or rich countries. Anyone can do it under proper governance. The techniques may vary, though. Scientific appreciation and information are extremely important. Here again an act of pre-emption may be unnecessary and can complicate the situation if it is wrongly perceived. Another danger is that the governments may use pre-emption as an excuse for hidden objectives. Pre-emption is the most effective method of handling national security issues related to 16 identified elements (Chap. 6). The word “prevention is better than cure”¹⁴ is the native form and perhaps the crude beginning of the word pre-emptive techniques. Today pre-emption is what happens more or less when an international agreement is prepared for cooperation in handling transnational issues; a contingency plan is made to evacuate people in an impending disaster, or the governments plan their budget expenditure for development. There are many threats that have been pre-empted before they take determined destructive forms.

But the greatest drawback of pre-emption is hidden in the inability of the government or the planners in making the people understand the existence of threat(s) that need to be pre-empted. These threats are not visible except for a few who are engaged in their elimination by pre-emption. Even for them it will be difficult to model the pre-emptive techniques as the changing relative aspects of the threat-to-target configuration may not be clear. Another problem is using pre-emption by misrepresenting people. These drawbacks could be obviated to a certain extent by effectively managing information. Pre-emption’s greatest advantage is that it eliminates all the preoccupation and chaos related to engaging the threat in threat-to-target analysis once the threat has moved towards its ultimate destination, because it is where chance plays truant and makes it difficult to engage the threat. A prolonged border dispute is an example of how chance can change the threat while on passage. But then, what is chance? Before that it is prudent to examine risk and uncertainty, two entirely different terms that can make a threat manager see red.

¹⁴The author politely disagrees with this statement ab initio as it is situational especially in national security governance.

4.3 Risk and Uncertainty

Risk carries or, rather, delivers assured prospective loss (APL) with it. The prospectiveness for loss marks risk different from threat and uncertainty. Risk will deliver loss; it is certain. That is why it is risk. Taking risk will end up in gain or loss. Hence, the better option is to take risk. Risk is a “dynamic” action or inaction. Here inaction is the action. Risk explains the hidden potential which could also turn out to be improbable in the process of risk-taking, yielding opposites in the two-sum situation. Risk will be present in every walk of life and its proceedings. Accordingly risk has to be handled based on the risk-taking capacity of threat managers.

Response to risk (risk etiquette) is a two-way decision: take or don’t take. If not taken, risk will deliver loss; if taken there is a “chance” for gain. This doesn’t mean risk has to be taken. It is a decision process.

Risk-taking is actually risk management in which the damages caused by the risk is minimised or in cases where risk is beneficial, that is, if yielded, then the benefits are maximised. Risk runners become critical when the quantum of risk is high. They are determined. That is also the basic human nature for survival. If that is accepted, everyone is a risk runner. Risk cannot be avoided once known. In this lie the benefits, if at all, of the risk running behaviour pattern. The famous footloose comment on survival, “fight or flight response”, is about risk taking, though it is associated with risk-induced stress. Both “fight” and “flight” are actions. Since this behaviour is inherent in living things, a human (or a human system) only has to polish the inherent risk running insight. But there is a tendency to involve risk with uncertainty to the extent that often they are confused with each other. The often-used definition of risk that “risk implies future uncertainty” is one such expression. It is not exactly so when teamed with national security governance. It only shows that the concerned management was not able to appreciate risk. It is important to understand here that risk can be appreciated but uncertainty cannot. That is the major difference between risk and uncertainty. Uncertainty is lack of certainty; something is not certain (sounds simple), whereas risk is present, seen or unseen. It is certain according to the activity. Death is a risk, it is certain, but one doesn’t know when it will be to be exact. Death can be hedged by insurance, or other means, but time of death can only be a bet in uncertainty. An interesting aspect here is that death is like a stock market. The variations happen at the action of the moment. Hence time regulates the time of death which is certain. The death and stock market are just comparison. They are not identical, though some may die when the stock market crashes like crazy.

Every walk of life experiences risk and uncertainty. The definitions too change accordingly. Risk can be assessed based on various means including observations or previous behaviour patterns of the concerned matter of interest. There are interplays of laws of invariance and limitations in risk analysis as well as uncertainty refinements. Refining uncertainty into certainty is a method to minimise the darkness surrounding it for decision-making, whereas one has to hedge against risk if the resultant is expressed in loss wooded in the cloud of uncertainty.

Risk profiles of an entity or situation is one of the ways to appreciate risks. But it can change with respect to the entity itself. There are various risk management strategies. But national security governance is a metamacro¹⁵ topic where loss associated with risks can turn the tables completely for governments and the nation. Generally the populations are risk averse. And so are their governments. They should know the risk is always there. There is no question of asking, “why take risk?” They need to take it either by taking or not taking—flight or fight. Risk, as mentioned earlier, can be predicted. It is the possibility of future outcome. Risk can also be measured and quantified. Probability assignment is possible to risks but not with uncertainty. Uncertainty is singular. It defies the probability edifice. One doesn’t know how to assess it. An interesting facet is that risk and uncertainty are closely related. In risk measurement one is measuring the uncertainty element within it, whereas uncertainty is hidden with risk that is not certain. (That is also the reason why risk and uncertainty are explained under the same subsection here.) It is this closeness that makes decision-makers mistake one for the other. That is when chance appears on the horizon. If that happens, look for chance. Can chance be creed? Yes, very much.

Assured prospective loss becomes uncertain when there is an offer of an alternative path. Alternative paths are all the outcomes that would have happened, but did not, according to Swiss author and entrepreneur Rolf Dobelli (2013).¹⁶ His explanation is based on a game of chance (yes, chance)—Russian roulette. In the chapter, “Congratulations! You Won Russian Roulette”, in the book, *The Art of Thinking Clearly*, he explains the challenge by a Russian oligarch to win 10 million dollars by just pulling the trigger of a revolver with one round loaded and five chambers empty. It is a game of chance as well as a chance offer (one doesn’t get such offers every day) that one with nothing else to think about except a life-“saving” windfall can’t refuse. There could be other reasons too. What is important in this study is that there could be a “reason” or reasons for the player of the game to pull the trigger. According to this study, the reason need not be the money alone as Dobelli suggests. This is a personal view of the author that can be challenged. The view is that the (prize) money could be just collateral. The built-in suicidal tendencies of a human may lead one to enter the game with a gambling instinct. A gambler perhaps may love losing the game rather than winning it. This, if true, can make the idea of game theory in operation research to think about suicide. Money could be only an excuse. Here too the decision-making is under uncertainty that will be cleared if the reason is known. The player is interestingly the target as well as the threat. Option is to play as the target on one side and threat on another. It is a great game narrated by Dobelli

¹⁵ Author’s choice to explain national security is not just about macro-governance but metamacro considering the subject is heavily loaded against. This means national security governance is loaded with metamacros, one within the other which causes the heaviness. This also indicates that governance needs to be seen as a metamacro concept. Simply put, take it seriously.

¹⁶ Dobelli, R. (2013). *The art of thinking clearly*, London: Sceptre

with a mix of risk and uncertainty marinated in chance before sizzling on the fireplace.

Interesting side of Russian roulette is the threat-target unification, while the target overwhelmed by suicidal tendency can pull the trigger and attain the much desired nirvana or become a millionaire and put aside the loss for another day hoping on chance. Can there be a situation in national security governance for threat-target unification? Plenty. That is the only dual where uncertainty and risk are at minimum.

4.4 Then, What Is Chance?

Chance is a possibility of something happening. Chance happens without any reason, according to one of the explanations. It is not possible for something to happen as an effect without a cause¹⁷. Under this paradigm chance is when the cause for something is not predictable or known. Or is it?

Chance yields gain or loss, which again is a relative perception. Can chance be generated towards gain? Or can it be induced tactically to generate loss to the adversary? Invoked for gain by choosing a vantage point? Simply put is chance farming possible¹⁸?

Chance creates random happenings. Chance is a subject of study among philosophers, theologians, scientists, governments, military strategists and so on. The theory of Clausewitz about “fog and friction” associated with war is about the chance-induced uncertainty. According to Clausewitz,¹⁹ war is a necessary ingredient of international relations and thereby legitimate. But chance can play a serious role in war. His book *On War (Vom Kriege)* on military theory was first published in Germany in 1832 after his death. The book is still relevant.

Chance is a modest word that can get away with easy explanation. According to Leonard A. Rastrigin (1929–1998), the Russian scientist and specialist in the field of cybernetics, chance is unpredictability based on human ignorance.²⁰ It is central to human ignorance in a cause and effect situation. Chance plays the most important part in the infinite complexity of the world and the human system. The only predictability about chance in a system is its definite presence within the system as

¹⁷ There is a contradiction here related to a previous statement. But it explains the case sufficiently in the context of the section.

¹⁸ A term by the author which says humans can induce chance to create an effect. But the problem is it is not clear whether the result will be desirable or undesirable though both are relative expressions. Chance farming is creating chance to bring a change expecting the result will be positive and support the original objective. People do create situations that induce chance, though often unknowingly. The section in chance doesn't superimpose chance farming in the explanations. It needs further research.

¹⁹ Carl Philipp Gottfried (or Gottlieb) von Clausewitz (1730–1831) was a Prussian general.

²⁰ Rastrigin, L.A. (1973). *This chancy, chancy, chancy world*. Mir Publishers. pp. 18-22

long as the system is in existence. Chance will cause noticeable or unnoticeable effects in the system relative to it.

Though Daniel Goleman, the author of *Emotional Intelligence*,²¹ states that the human brains are still primitive designed for the caves and forests,²² the humans undoubtedly belong to an advanced breed today, at least on the head end of the unitary civilisation. But, their handicap in knowledge is massive. Limitations in knowledge about the happenings reflect in chance as the cause. Chance replaces “cause” that cannot be identified by limitations on knowledge or the primitive mumbo jumbo of the brain. Is that fine? Well, no. Limitations of knowledge are still applicable to all sapiens including the author. Chance, thereby, becomes a word of convenience here; the cause is not known. Hence chance is a common term for the missing causes. It is an ideal world for chance to intervene. Limitations of humans are in the accuracy of measurement because of the complexity of the system and the principle of uncertainty or indeterminacy.

The principle of indeterminacy was first formulated by Werner Karl Heisenberg (1901–1976), a German physicist in 1927. That earned him a Nobel in 1932.²³ While the principle of indeterminacy or uncertainty is based on physics, it is equally applicable in other activities. The principle simply states that when uncertainty of a particular part of the system increases, the accuracy of predictability by measurement (certainty) in another part of the system increases and vice versa. A prejudice triggers an uncertainty—chance takes over. But the world of humans with their quest for knowledge lives on in spite of all uncertainties.

According to Rastrigin’s take, chance rests on the following:²⁴

- (a) The principle of uncertainty or indeterminacy
- (b) The inexhaustibility of the universe
- (c) The limitedness of human inability (at the particular moment in time)

According to Patrick Suppes (1894), the view is that the universe is essentially probabilistic in character or, to put it in more colloquial language, that the world is full of random happenings (Suppes 1984: 27).²⁵ But the fact is that though chance may have close contact with randomness as they often overlap, they are different in approach and application.

The conclusion that can be deduced from these findings is that chance will always exist where indeterminacy or uncertainty prevails, because the system has too many unknowns within it and there is a limitation for the humans to predict the future just like the way the past cannot be changed. Allowance for chance, therefore, becomes

²⁵ Antony, E. "Chance versus Randomness", *The Stanford Encyclopedia of Philosophy* (Spring 2019 Edition), Edward N. Zalta (ed.), URL=<https://plato.stanford.edu/archives/spr2019/entries/chance-randomness/>

an expert field of study for the never-ending spirit of the humans to learn and practice. Chance as a subject has been studied by many scholars in various fields. But for the purpose of this book, it is limited to the statement that in threat perception, a major activity is managing chance.²⁶

Chance cannot be discussed in isolation without reference to another equally complicated, but very friendly, concept—entropy. Entropy makes life move, even in the human game of statue. It originates from the famous second law of thermodynamics postulated by the French engineer Sadi Carnot.²⁷ According to him, a closed system tends towards its most probable state—the state of complete chaos.²⁸ According to this law, all systems that are completely isolated ultimately become disorganised, decayed and dead. In engineering, it is called depreciation; biology, aging; chemistry, decomposition; sociology, decay; and in history, decline.²⁹ The second law can be further extended to serious studies on issues related to national security and allied subjects.

Entropy can explain the degree of chaos or disorder in a system. It is clear that entropy in such systems that tend to proceed towards chaos will increase until it maximises at the point of “end” or destruction. That means entropy is irreversible; it does not decrease in a closed system. In other words, a closed system cannot by itself increase its state of organisation.³⁰ In threat perception, one is dealing with a closed system where the entropy is on the increase with respect to time. The solutions under such situations, according to the laws of chaos and disorder, are far too many for those who dare to explore (Chap. 35).

²⁶Chance occurs all the time in shaping the universe, the world and all in it including the human system. It happens every moment. Some are noticed, and some the people are not even aware of. Among those noticed a beneficial chance is called luck and a damaging one, ill luck. Whatever is neutral is not talked about. It is chance that gives rise to the fog and friction in a war scenario and, also, in many conflicts and activities. Managing chance economically and effectively, therefore, is a crucial aspect of any activity, not those related to national security alone. It is giving allowance for chance when a debate takes place with such titles as, “if so and so had not happened, what would have been the situation today?” An example is the question: What if Abraham Lincoln was not assassinated? Under the laws of chance, such a situation has no probability of occurrence.

²⁷Carnot, Nicolas Leonard Sadi (1796–1892), was a French physicist and military engineer. In 1824 he conceived the ideal heat engine, called the Carnot engine, which used all the available energy. Here is where he discovered that heat could not pass from a colder to a warmer body, and the efficiency of the engine depended upon the amount of heat it was able to convert into energy. This discovery was called Carnot’s cycle in heat engines and paved way for the second law of thermodynamics. The second law makes use of the concept of entropy that states that in an isolated system any change is accompanied by an increase in entropy. Entropy, under chaos theory, is not restricted to thermal engineering alone.

³⁰Rastrigin. Ibid.

4.5 Counterpoint: Threat, Risk and Uncertainty

In the discussion so far, threat, risk and uncertainty are considered as parts of a decision triad. It means they are inclusively dependent on each other. The dependency factor will be the firm criteria to treat them together in decision-making. The triad cannot be formed if they are mutually exclusive. The triad or any dependent network won't exist if one of the elements is removed from it. Hence it is important to revalidate the claim of mutual exclusiveness of the three aspects of decision model—threat, risk and uncertainty.

The game starts with threat that makes the target attractive to threat. That is when risk steps in. There is no threat that is risk free. A risk can give a gain or loss and one has to act on it by facing it or moving away from it. It is an action plan. An action will be time oriented. Standing down inactively in the face of a threat is also an action in threat management. Standing down is an action based on decision. The next parameter is uncertainty. Uncertainty ideally can make an entry anytime. Normally it is when least expected. That is why it is uncertainty. Eliminating the unexpectedness in the game plan will dilute uncertainty by exploring the probability and randomness. The time to nail uncertainty need to be ascertained as certain as possible. That is the game to play with uncertainty—to make it as certain as possible. There are various methods of diluting uncertainty. They are situational. Uncertainty is separated from chance in this appreciation, and the principle of uncertainty is considered as law of chance. The principle of uncertainty means that there is inherent uncertainty in the act of measuring a variable. In the theory of Heisenberg³¹, the principle of uncertainty in physics is applied to the position and momentum of a particle. The principle states that the more precisely the position is known, the more uncertain the momentum is and vice versa. In national security governance, it could mean a lot more. The bouquets a government gets for a deed considered good by some may follow with brickbats or stone pelting from another side. The uncertainty principle is part responsible for the law of limitations.

This shows all the three parameters, threat, risk and uncertainty, that have different identities but are linked in decision-making for governing the target. The target minder has to dabble in all the three parameters as an integrated triad in problem solving or independently taking them separate from each other. It is individual expert choice. But where does one place them when they are bounded by a fourth element that remains a puzzle to the sapiens ab initio—chance, the fourth aspect of appreciation? Chance will not give a free run to decision-makers, especially when it invokes the law of uncertainty (chance, by this study)—the more one focuses on a topic the more chances for something least expected to go wrong.³² In fact, chance covers the entire triad.

³¹Werner Heisenberg (1901–1976) was a German theoretical physicist.

³²Rastrigin quotes this law using the cathode ray tube (CRT) where the more one focuses on the precision of emission the more it will slide at the hit point of the screen. This principle, the

Except for the sapiens, no other living things are bothered about chance though every one of them is subjected to it. But threat, risk and uncertainty have a say in the case of a life form whether they are aware or not. Watch lions hunt, monkeys warn and snakes build up speed in the flight mode. Chance stands separate, not part of uncertainty. For example, natural selection in evolution is a chance inflicted element. It is there for the lowest living thing, which according to the author is the living dead—virus, a noncellular zombie of sort that carries a DNA or RNA and replicates inside a living thing. It can infect a variety of living organisms. For many the smallest living thing could be bacterium, unicellular life form, to be precise as of now, *Mycoplasma genitalium*. That doesn't matter as long as there is no difference of opinion about the highest along the road so far—the sapiens. In natural selection an interesting fact that supports the chance theory is that there is no break in the chain of evolution in spite of new forms that have been selected naturally. Everything and everyone who were there from the beginning to end still live together as succeeding generations in the planet of all. That means from the virus to the sapiens. It is not that after the evolution the one from whom the superior one evolved quit the ground. Some of them may have gone (temporarily) as endangered since the time is not suitable leaving their life traces behind in another form. The dialogue here is not about life and theory of evolution or natural selection. It is about chance—creation without destruction of the cause. And chance is also causeless. Of course that is what this book has been mentioning a few lines ago—absolute contradiction. Chance remains the force of everything because there is no life or no life form that is not affected by it. Chance becomes chance when the cause of an effect is not known. But the effect subsequently becomes the cause for the next effect. Humans are the only ones who may at least see the ghost of chance. Chance is much larger than threat, risk and uncertainty as long as the law of limitations of knowing prevails. Therefore chance has to be seen far distinct from uncertainty. Law of limitations can play havoc to human intellect and life.

4.6 Knowing the Unknown: Data, Information and Intelligence

Knowing the unknown, rather what is going to happen, is the fretful need of the sapiens. No one else among the billions of living things, in fact “hell of a lot” of them (did somebody count?) including present day *Homo sapiens*, wants to know how the future looks like from the next moment onwards. And they survive under the four predicaments discussed in this chapter—threat, risk, uncertainty and chance, as if they don't exist. Every living thing other than the sapiens follows life, self-placated and more or less withdrawn into the existential mode as if that's all about everything.

uncertainty principle, is called the Heisenberg uncertainty principle or indeterminacy principle as articulated by Heisenberg.

They do it using their respective default mechanisms for survival. Then what is the difference between humans and the rest of the “hell of a lot” minus one living things? The problem with humans is in their own default mechanism for survival. That demands looking into the future. That is the high price one pays for being in the high place, the sapiens stasis. There lies the catch. But before getting into the default survival mechanism of humans, it will be interesting to look at an instant method (something like instant iced tea) humans have developed to see things before they happen—the abracadabra of intelligence, where intelligence referred to is not the astuteness of human mind in the neural sense but information processed to know what is going to happen. Simply speaking, counting the chicken before they hatch. The problem is that the humans think that much is sufficient.

What is intelligence? Threat perception and analysis can be carried out only by effective intelligence beyond the accepted cornucopia of information. Mere information will not be sufficient to break the complex code of threat, risk and uncertainty integrated by chance. Even information has to come from data. Neither data nor information (refined data) can be the basis of decision-making. It has to be pure intelligence. Here intelligence is the “intention” of the threat agent that generates the threat. Intelligence gives the direction and measure of threat against time not threat per se. This has to be used to create the TID cell or analyses by the actionees. The intention is important to decide countermeasures. Intention also includes time dimension. It is all the more important, therefore, to be supported by an extremely well-managed and well-designed form of intelligence in every faculty of national security. It is a big job indeed.

Threat has certain duality in it. This duality calls for accuracy in actionable and real-time information without which the threat gains advantage (of course, for the opponent who or what it may be). Such information is intelligence, though intelligence is a much wider term in its practicality. There is a difference in intelligence in threat perception and assessment and intelligence related to operations. In operational intelligence, secrecy is the keyword where intelligence is denied to the opponent. In threat perception and assessment, one may sometimes let the adversary know about the threat—by overt activities, warnings, etc. Often it is done when the perpetrator is trying to save cost and effort by achieving the result otherwise. A threat that is exposed by the perpetrators in human-induced situation is a sign of weakness on their part unless it is a planned psychological operation. Often it is not, though most of the analysts believe it is, because, the desired psychological results can be achieved, even at a higher degree sometimes, by actual action.

These observations can apply to any field of competition, not in a conflict situation alone. The aim here is to understand threat as a general perception with respect to national security, not from the conflict point alone. These are the points the planners of national security should know. An intelligence system makes planning effective. It will acquire, collate and process information from sources and will evaluate processed information to appreciate intelligence. Planning as a process starts with evaluation of the characteristics of the threat and the shape and nature of it. The next step is to identify its likely momentum and position in the TMC as appreciated. The various points before it reaches the target are evaluated, and the

most convenient position to engage it or nullify the impact is identified subsequently. As mentioned before, this activity with respect to a threat may last seconds, days, years or even centuries. Secrecy is essential. In certain cases transparency stands to advantage. Deception could be of advantage in a conflict situation, except when a win-win scenario is required to achieve the objective. In most of the cases of national security, a win-win scenario yields better results. That is for the sapiens to note.

4.7 Sapiens Forte: Seeing Through Time

Humans are the most advanced form of life on Earth (according to them). Before someone counters this statement, it must be said that human intellect has been taken as the factor in deciding it. Here also there are other living things that may stake claim for the post of supremacy, of course through humans, like ants. But it is the human who has, perhaps, the simplest of all tools and shields in the living world with a fine edge that is advancing with time—intellect—and not jaws, claws, toxins, muscles, quills, fangs, antlers, horns and so on. Somebody name them. Every living thing has something in its armoury to defend itself without which it would not have been there. All in all, there is something interesting about the survival tools of life forms.

Until now, no studies have directly tested whether those weapons perform better at the animals' own style of fighting than they would, using the survival combat style of differing species. Simply put, are they meant for survival among own species or cross-species? For example, can even the most intelligent animal use intelligence as a survival tool against human intelligence? In all respects, species-specific survival tool should be for endurance within, not across to gain supremacy. An ant cannot win over an antelope with its survival weapons or an antelope against an ant. Because it is not in the list of minimal needs of either the ant or the antelope to survive. The survival kit of an ant should be normally exclusive to its own species as its design parameters cannot appreciate the prospective adversary from another species. Researchers recently discovered that the weapons of each species are structurally adapted to meet their own functional demands of fighting for survival.³³ The argument here does not mean that the survival tool cannot be used against another species as a scorpion can kill a human with its toxin. But it has to be seen from the living instinct more than a cross-species survival. Tools for own survival means survival within own species. That is actually what balances nature—survival within one's own species increasing the potency of the species as a whole to survive. If that is the rule, then humans need advanced intellect to survive as a human among humans, not "weapons". Intellect for human, therefore, is not a weapon but a tool for existence. But when intellect is used to convert into weapons, it becomes a let-down,

³³“UM Research Reveals Secrets of Animal Weapons”. https://www.spacedaily.com/reports/UM_Research_Reveals_Secrets_of_Animal_Weapons_999.html. Accessed 20 March 2020

a kind of retreat from the standard. This can be argued saying that humans are at their primitive best, not advanced at the moment, acceptably so.

Interestingly human intellect can be used against cross-species. That is how the immigrants used it to kill the buffaloes to eliminate the indigenous people who cornered them against gold deposits. Things have changed today again using human intellect. It further clarifies that human intellect is more than a weapon even if it is. It is an endowment to the sapiens systems guaranteeing continuance.

Under this argument and looking at life systems as a whole, survival tools will be semantically a more acceptable term than survival weapons. Weapons denote deadender existentialism. It sounds negative in a limited life. The fact remains that humans feel their lives are highly limited. It is a relative feeling but absolutely acceptable in the rhythm of life according to evolution. Rather, that is how it will be. This also means decision-making will have a logical limit. Therefore risk for some can be uncertainty for others.

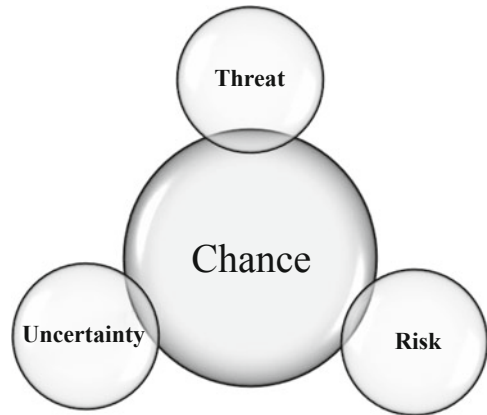

Chance accordingly is a multi-conceptual occurrence without cause (imagine!). Chance is ever present in life systems being the possibility of something happening. And they have causes that are not possible to decipher considering human limitations. Chance generates many names—luck, shock, fortune, surprise, windfall, omen, curse and so on. It also leads ways to thriving businesses and dealings. If not understood clearly, the triad elements, threat, risk and uncertainty, which are anything but chance get caught in many decision models.

Ultimately the human survival tool, the intellect, is about the mind game unlike in other living things where it is more “physical”.³⁴ There are two points for validation here (meaning in this study): 1) if human intellect is compared with physical survival tools of living nature, the sapiens world is at the top of life forms; 2) like any other survival tools, human intellect as a survival tool is meant for survival of human species, not destruction of others or one’s own species except for positive survival and advancement of species.

This is where the game changes in sapiens—they can see the future. Explaining this concept is a bit difficult. This is against the background of the much talked about (so far) triad. All the elements of the triad—threat, risk and uncertainty—are active only in the future, the time yet to come. But “seeing” through time also means seeing through the time that has gone by (the past), the irreversible entropy faction. And whatever a sapiens sees through time in the future has to be firmly established by fact which is a combination of threat, risk and uncertainty. Even if one doesn’t visualise or appreciate in advance the things of the triad, time is bringing them towards the subject, like advancing flood water carrying the flotsam to deliver with it or something similar. This is just for explanation. If that is so, only then, the threat, risk and uncertainty assimilate into one, a unitary model for decision-making. If not, if this assumption is not true, the game of future vision has certain constraints by nature limiting sapiens saying that you can’t go beyond this. Does it limit

³⁴More physical means just to explain nothing works in a living system without intelligence or neural prime movers which is the highest in humans.

Fig. 4.12 The TRU triad and chance

intellect then? Something like an apple tree bearing fractional apples? Well can't say until some of them fall down and scientists pick them up to observe.

Whatever, it is better to make out threat, risk and uncertainty separately wrapped as a triad model in chance for making decisions until such time humans can distinctly see into time as clearly as across the windshield and rear-view mirror (irreversible) of a car they are driving. Till then the ability of humans to see into time can be kept as a blessing continuously fine-tuning for survival and carrying forwards to generations with the new prints, in the charade of life. The triad and its interplay with chance (Fig. 4.12) will be guided by the human intellect in the quest for survival beyond generations. That is the law of a life for all. It is the next generation that matters in every life.

4.8 Summation

The objective of governance is to maximise national security, the well-being of people. It will fail if the threat hits any time the collective centre of gravity of the target of national security where governance is ideally focused. In this statement, the connotation of threat is the associated negative factor in popular semantics that can damage the excited stasis of the target. Interestingly, threat has to be there for the target to remain dynamic shining in threat attraction. Threat is vital for the target, but not in active mode of mutual annihilation. Keeping the threat at bay is the game plan in national security governance. Threat is an indicator that the target is attractive to it. That is the desired situation. Target exists, attractively. The ideal situation in this stasis to keep the target dynamically firm is to ensure threat remains but doesn't hit it. The mythological heart of the dragon or, rather, the Achilles heel of the target is situated at the centre of gravity of the objective in national security. It is guided by a mix of threats, risks and uncertainties all in a gumbo thickened by pods of chance.

Perceiving a threat in the concept of national security can be as misgiving as perceiving risks and uncertainties. The threat is not to the concept but to its objective. The authority concerned—the government—decides the objective. In an ideal situation, the objective is to maximise national security. The centre of gravity of a target can shift with respect to time in certain cases while dealing with national security. The threat that causes maximum damage is the one that aims at the centre of gravity of the target. In this analysis, the topic of threat perception and assessment is examined in general and not specific to the concept of national security. It is important to understand the concept of threat by itself before appreciating the threat in relation to national security or, to that extent, any specific subject. The overall requirement is to prevent the threat from meeting the target—the objectives of national security.

In national security, a threat is a force that may hinder the objective of governance—national security maximisation. For this the identified threats come in eight different dimensions. Each of these dimensions has its own characteristics. They need to be identified and calculated precisely. The threat-target encounter is eliminated either by moving the target to deflect the threat away or by destroying the threat. The threat is destroyed by engaging it in the time span available in the threat-to-target passage time or by pre-emption. While pre-empting, the profile of the threat will be different. It will be the prime mover mechanism of the yet to happen threat. The threat profile in pre-emption can be human or otherwise.

In the study of threat perception, it may be thought that one of the methods could be reducing the threat attractiveness of the target. But it is not practical. The threat attraction of the target is always by default in national security. It is a reality. An interesting find is the system entropy that is the measure of the disorder in a closed system. Entropy always increases and is irreversible. Reversing entropy is impossible according to studies. That is why miracles do not happen.

Risk is the other element of the triad. The government will have to deal with it exclusively. The first principle is to understand that all the three elements of the TRU triad have their exclusive characteristics and behaviour patterns. Therefore they need to be handled exclusively as well as under combination while making decisions.

Unlike threat, risk is indifferent to the attractiveness of the target. Risk induces mounting and abrupt ineffectiveness in system performance or a trade-off gain. The loss due to ineffectiveness will be varied, the ultimate being constructive total loss. That is when the last of the possibility of a constructive gain in the event of a loss is shattered. Loss happens when threat exploits the attractiveness of the target. The exploitation can be natural, accidental or purposeful. Risk, thereby, becomes the situation where there is a credulous or astute exposure to danger or a gain by return. Risk is a case of make or break. It is a kind of single-player two-sum game—one

could be a winner or loser in the game of risk, nothing in between. To think of it, the whole life is a uni-player³⁵ zero-sum game—risky.

Uncertainty too is associated with situations. Uncertainty behaves like a logical black box denying access to information and knowledge. It needs to be penetrated to make things as certain as possible. It is a limitation under the law of limitations. “We don’t know, but we need a decision”—a confirmation of what next, without knowing it—a shot in the dark. Uncertainty is associated with survival emotions such as anxiety, stress and so on. Uncertainty can be threatening, but it is not a threat in the true sense as it is also not a risk. Decision-making under uncertainty is not similar to decision-making under risk. Is life uncertain? No, if one uses the intellect to see through time. But yes, if taken as a shot in the dark. Decision-making under uncertainty demands the ability to wipe out the fog from the shield of time to make it as certain as possible.

Chance is the possibility of something happening. Interestingly, chance skips cause—the possibility of something happening. The world is chancy. Chance plays around with threat, risk and uncertainty. Rather, chance enjoys it as long as the godfather of all permits it—time and its associated relativity. They are further peeped through.

In the overall examination of threat, risk, uncertainty and chance (TRU-C), chance stands a bit separate as if at the door but with a foot in it. It can be used to steer the TRU paradigm by manipulating the triad positively. Though there are many limitations in the application of TRU-C in decision-making, the pocket TRU-C (Box 4.10) may be drawn on while making decisions.

Box 4.10 Pocket TRU-C

1. Never mistake one for another.
2. TRU and C are mutually exclusive, but application to decision problem could be in hybridity.
3. Handle cautiously:
 - (a) Threat: prevent, pre-empt or allow and mitigate if opportune.
 - (b) Risk: hedge.
 - (c) Uncertainty: see through and increase probability of certainty.
 - (d) Chance: create chance before it induces itself.

³⁵ A term to mention single-player zero-sum game which is not a part of game theory but exists in the case of handling unknowns in governance and even life as a whole. The so called “risk-takers” are uni-players in a zero-sum game—“win I rise, lose I fall”.

5.1 Introduction

Governance is a game with a purpose—an objective that takes the protagonist to a targeted goal. The protagonist is the government in national security studies. Government has to govern being the harbinger of well-being. The government is not only an agent of people for governance but also a kind of responsible and dedicated human whisperer based on advanced intellectual and modern productive power centre etiquette. Governments come and go in different forms, shapes and characteristics like agents or agencies of people for governing them. They are accepted by

people under permission to govern the particular human system with or without the latter's consensual and active participation. All governments are democratic in form if democracy means "peoples' participation" in governance for this study, because what the modern system calls democracy is actually an ancient term and even in the present-day democracy (as called for the type of government) it is the powerful (majority) who rules that too prioritising their part of the well-being selectively. It is evident in the most modern types of governments in democracies. There is no difference from the ancient and modern in people governing people. It is part of the law of invariance. Governance is always by the people, of the people, for the people, hence democratic in form.¹ No other type in any which terms is relevant in the study of national security as long as people are aware they are governed whether they like it or not.²

Linking what this author calls democracy in this study with what the rest of the entire world of billions call democracy is not difficult. It is done here. India and the United States are examples of most modern democracies which they call electoral democracies. There are others too where democracy is by a set of people ruling under consensus by majority with an equally strong though not in equal majority resisting it in the name of checks and balances though in reality gaming for power. Hence this study concludes there cannot be any government with absolute peoples' *consensus ad idem* in the human system. It is a natural fact and therefore acceptable. Peoples' rule under absolute consensus is technically an impossible fantasy. Utopia is not the name for this impossible fantasy. In fact under the clashes of checks and balances by default in human systems, utopia will always be a fantasy. Humans are not made that way. They decide under clash and conflict. As long as this lemma exists, either every

¹This term would have been very well any other suitable one. But humans are familiar with democracy as a term associated with the typology of governance by a government. The conditioned appreciation is that it is the best and most modern type of governance appropriate to the advanced (civilised?) human as what they consider themselves today. But it is not so according to this study. In the larger sense, democracy is not strictly a type in the larger sense but one of the two forms of governance. This consideration satisfies its antiquity and the social cooperation requirements of the humans as a species parameter. It got mixed up like the ball of wool that the playful cat mischievously knotted up. No, not a Gordian knot; don't have to invite Alexander to cut it and govern. The term democracy is retained in this study for the form as well as the type without cutting the knot in usage and familiarity among people. It sounds modern though ancient and also rooted in the people for people concept. Democracy in this study, thereby, is a new term in the old style meaning rule of the people by the people through an agent called government, as there is no other way to rule except changing the "types" of government in many different ways all under the nine letter word democracy, the form of governance by people through an appropriate and identified agent. Miss it, there is a choice which is worse than democracy—anarchy. Democracy as what it meant to be in this study is reiterated further in subsequent chapters for reinforcement of the idea as governance is at the core of this study. As a scholarly friend mentioned to the author, years back, every type of government is similar with respect to those who govern and whom they govern. All are part of the form of governance called democracy including democracy, one of the types with many subtypes.

²There are also people in many countries that are not aware they are governed or even if they are aware never think about it seriously to recognise those who govern them.

form of government is democratic or what is being called democracy under the pseudo-theory of peoples' choice is an absolute farce. It is fine if the latter is called elected democracy for the moment.

In the meantime this study resolves any form of government is with a set of people agreeing to it and another opposing silently, submissively, rebelliously or vociferously. If that is acceptable, this study reiterates that it is focused not on the form of governance or type of government but the role of government which is governance for well-being unified under it. This way the study concludes that all governments are unified in desired role. It is only a question of how much they can provide. The only other form of governance is by the people without an agent called government. That is anarchy. Anarchy too is governance; it could be fine if people mean business and are serious about peoples' well-being in the absence of an agent.

The targeted goal of governance, the well-being of people, is the end objective which is never attainable in toto as human systems evolve under the law of invariance limited by the law of limitations. Well-being thereby becomes moving objective leading governance towards a horizon recalibrated on course or a variable horizon where the maximum variability is moving away by equal amount of progression. Yes, this is mathematics for explanation of the moving end objective—well-being—in governance. Human system governance in its overall sense falls in the variable horizon category, where variability is not the maximum limit but an expression to emphasise restrictions in the total achievement of the objective. That is the way of the sapiens world of singularity against the shadow of differentiability. That is the way human intellect is configured against time—progression under imperfection. Limitations abound all through.

The protagonists have “no choice” but to govern the human system as they deem fit within their capability to provide well-being to the people. The well-being will be hinged on apparent security, but the expectation of the people will be based on perceived security. The protagonist has to take on both—maximising apparent security and preventing the virtual minimisation of perceived security. Before looking at the aspects of how one could govern the system, it will be better to establish the “turf” or field in which the protagonists have to play the game of governance. Here it is important to understand that the type of government may be different but the role of governance is similar under unified objective of well-being under the concept of national security. So, why worry about the form of governance or type of government?³ The terrain may matter more. People realised it very early.

The *Vedas*,⁴ considered the most ancient scriptures, deciphered human thoughts engaged in knowledge generation, knowledge retention, knowledge distribution and

³A friend from a responsible family of rulers once told the author when there was a query and debate on the ways of governance in different countries, “Yours suits you; mine suits me; what is the problem?” He was right. What we both didn't realise at that time was both types of governments were alike and fell in the same groove—democracy.

⁴Microsoft Encarta Online Encyclopaedia. 2001. Vedas are the ancient hymns and incantations in Sanskrit compiled in four collections: *Rig Veda*, *Yajur Veda*, *Sama Veda* and *Atharva Veda*. Though their exact periods are not known, it is estimated to be around 1,500BC. Initially

knowledge regeneration. In this process they identified five fundamental gross elements: earth (*prithvi*), water (*jala*), air (*vayu*), space (*akahsa*) and fire (*agni*).⁵ This, perhaps, is the earliest separation of the overall field of human activity. The field comprises five segments, each bounded by its own characteristics. They were called the *pancha bhoota* (five full-size elements). There are various explanations for the classical elements in different knowledge originations. It is natural as the concepts found way into human minds as belief systems linked with reality and represented by known forms of perception. In the wisdom of the ancient, the five key elements governed everything about human lives and destinies in the universe.⁶ Obviously this knowledge development is by sensory perception, specifically in the “see and feel” mode with the involvement of other senses. Knowledge is what the sentient could feel and distribute. But these elements do not help one to identify his or her way through the maze of national security governance but show the conceptual thinking in terms of the elements that the protagonists have to look towards for governance. Further, they are not identical to the elements of national security that will be considered later in this study. But four of the ancient idea of *pancha bhoota* (Box 5.1) virtually and amazingly fit into the “terrain specificity” that could be used to explain the fields where the game of national security is played. The idea of the five elements can be borrowed for examining the concept of terrains of national security—the bounded domains where everything happens. The concept being evolutionary in its process is also time functional. The fields of governance were also evolving with human progression. The evolutionary aspect of terrain specificity makes the terrains compatible with national security intervention studies.

Box 5.1 Reverence to *pancha bhoota* (Five Elements)⁷

Reverence to the five elements (*pancha bhoota*) is to explain how Indians dealt with nature in the earliest days by classifying them. But the elements mentioned as *pancha bhoota* are “terrains” (*khsethra*) in national security studies. The typology of nature indicates the earliest attempts in how-to-think format in knowledge management. This is also highlighted in the ways of Hindu reverence to nature. Each of the elements of *pancha bhoota* is worshipped as gods in five temples in different locations in India:

transmitted orally, the hymns were collected and compiled in written form much later. *Veda* in Sanskrit roughly means “knowledge”.

⁵Rishi Kumar Mishra. (2000). *Before the beginning and after the end*. Rupa and Company. p. 66. The author mentions about Sun (*Teja*) in place of fire (*Agni*). The words in brackets are in Sanskrit.

⁶The actual term could be multiverse. The ancient Indian scholars mentioned about multiverse. Cosmologists today identified 11 universes under the M-theory which state ten dimensions for space and one dimension of time. See Stephan Hawkins. (2018). *Brief answers for big questions*. John Murray. p. 57.

⁷Mishra, R.K. (2000). *Before the beginning and after the end*. Rupa and Company. p. 66. The author mentions about Sun (*Teja*) in place of fire (*Agni*). The words in brackets are in Sanskrit.

Box 5.1 (continued)

1. Earth (*Prithvi*) *Ekambareswarar* Temple in Kanchipuram, Tamil Nadu
2. Water (*Jala*) *Jambukeswarar* Temple in Tiruchirappalli, Tamil Nadu
3. Air (*Vayu*) *Kalahasteeswara Swami Vari* Temple in Srikalahasti, Andhra Pradesh
4. Space (*Sky*) *Nataraja* Temple in Chidambaram, Tamil Nadua
5. Fire (*Agni*) *Arunachaleswarar* temple in Tiruvannamalai, Tamil Nadu

The first three of the fundamental gross elements are geophysical dimensions⁸ where activities are performed—land, sea and air space.⁹ The next is outer space that could be taken as the physical outer space, which is the expanse beyond the air space. Presently major human activities in outer space are restricted to the space contiguous to the outer limit of air space. It could be considered geophysical since it is connected with continuing human activities as a global commons. The contiguous space, therefore, is the part of outer space where human activities are primarily focused. The vastness of space has the potential to be divided into a multitude of terrains as the humans pursue their quest driven by the forces of evolution. It is too early to think of dividing outer space for national security studies.

The concept of outer space was evidently known to the Vedic scholars. There is a mention of outer space in the ancient Hindu scripture *Ramayana*¹⁰ when *Lord Ram* (an avatar of Lord Vishnu, the preserver of the multiverse) explains to his consort *Sita* (an avatar of Lakshmi, the goddess of prosperity and fortune) while returning victorious from *Lanka*¹¹ the island kingdom of the demon king *Ravan* who abducted *Sita* and held her captive in his palace. The return was in *Ravan's vimana*, a flying vehicle that could cruise in outer space. *Sita* was surprised to see the utterly dark sky. *Lord Ram* explained to her that since they were cruising through outer space what she saw was not the sky but the vast empty space beyond the sky where light never reflects. Therefore the empty space looked dark. It shows the ancient perception of terrain specificity even beyond geophysical terrains to a reasonably good accuracy. There is nothing mysterious about it though.

⁸Dimensions in mathematical sense starts differently with the x , y and z axes, the three different facets that humans perceive in reality. Scientists also believe there will be many more beyond the three axes. In national security study, the dimension is about the terrains that constitute the singularly integrable field for human governance.

⁹The word “geographical” is deliberately avoided here to give a larger meaning to the concept of terrains within the realm of all identified terrains of national security.

¹⁰An ancient epic of India in Hinduism which is an exponential treatise to examine national security governance. The characters are still reflected in governance almost as frequently as the political personalities in a government.

¹¹This name is strictly mythological and should not be misconstrued for the great island nation of Sri Lanka.

The fifth element in the *pancha bhoota* context—fire (*agni*)—perhaps could be there beyond all these and can be visualised when it happens one day in the deeper space of the universe or when dug deeper into the earth. But more than that, fire would have been thought as a separate element by the ancient scholars for the mystery attached to it. Fire is a perceivable chemical reaction associated with combustion.

What is important here is not the Vedantic idea of terrain specificity or physical aspects of matter and energy but the similarity of human thinking that defies time and space—one of the explanations behind the theory of invariance. This also can be used to hypothetically explain that the shortest period in time could be either the evolutionary pace in life on the planet or in human intellectual development, also on it. Where else?

Examining the peripheries of a dimension in a multidimensional system perception can also be seen as a comic book idea, like the robes that make a normal human change into a superhero or the team of multidimensional superheroes all collected in a single audiovisual show. The conversion is from normal to super. It is abnormal. But knowingly, the idea of multidimensions, in a believable mode, has resided in human perception since aeons. There are multidimensional worlds in the aeonspeak all over—the concept of heaven and hell; the group of earth, sky, ocean and underworld existing exclusively; netherworlds below the surface of earth and water; the *atma* theory of souls dancing out of the bodies especially humans; and so on.

The Incas¹² of Machu Picchu built 60% of constructions underground.¹³ For them the underground became the second terrain, though strictly domain under land. The terrain specificity has undergone from imaginary but believable perception to the reality of the knowledge world today. But the concept of multidimensional terrains stands changed. So where do the governments and the governed have to focus their pickaxes and pitchforks for constructive governance today? The answer is, “in the concept of terrains”.

There were many such ancient principles and thought processes that mentions about other worlds mostly on the planet and some beyond. All are pickled in belief. They linger prominently in human thought process all over the world. Watch the footballer looking up the sky and thanking someone up there and beyond after scoring a goal. Watch the believer disposing off painful reminders symbolically or otherwise in the sea after a ritual of ablution or throwing stone at the evil as a mark of respect to the almighty and benevolent, too many terrains in the layers of belief systems, all of them perceived security gestures that are very much necessary for individual survival through the rigours and pains of life. Governments and every

¹²Original American Indian tribe of Andes. They were almost wiped out by Spanish invaders of the 16th century.

human may respect it since life is interactive. Interestingly terrain specificity is also metaphysical and psychological. Those do not interest this study.

5.2 Concept of Terrain in National Security

The concept of terrain in this study is based on perceived and informed reality of national governance. National governance is a dynamic process being an activity. It has to be performed in one or more terrains. The results need to be integrated for national security maximisation. Every activity is result oriented. Therefore an activity is competitive. Chasing the goal is the overall objective of a dynamic activity ultimately to achieve it. The activity thus becomes a game that will have to have a specific turf to play. It is the terrain. The terrain has to be real, defined and present. The *pancha bhoota* or any other ancient principles of segregation cannot be the basics for identifying the terrains in modern governance. But they can provide hints on ancient thought processes and point out to the alterations in the evolutionary survival processes of the humans. It also means time converts modern thoughts into ancient one day.

Acceptance of a terrain needs to be based on realistic appreciation and assessment. The terrains can not only increase in number as humans advance but also expand in their scope and capacity. Playing the game of national security in the appropriate terrain, within the limitations, and maximising results competitively and integrating them towards human well-being are the roles of governments.

In its originally identified form, terrain meant land, ground or topography. According to *Art of War*, Sun Tzu's¹⁴ much-revered classic on military strategy, terrain is the immutable and real entity in a confrontation. The rest are variables with abstractionism and uncertainty sprinkled in judgment and understanding in strategic appreciation. Understanding the terrain clearly is an indisputable quest in any game plan in strategy. Chapter 10 of Sun Tzu's *Art of War* deals with positioning during confrontation.¹⁵ Confrontation takes place in a terrain that can be identified and well defined for strategic appreciation. Understanding the terrain is, therefore, important for success and ultimate victory in any situation that needs a decisive ending. Since "confrontation" takes place in a terrain, the capability to enter the terrain is an overriding requirement. Only those who can enter and survive in a terrain can confront the threats in that terrain. The classic document in the name of Sun Tzu is believed to be more than 2300 years old. Its importance is in the fact that, even after

¹⁴Encyclopaedia Britannica. 2001. CD-ROM. Ultimate Reference Suite, 2004, CD-ROM. Sun Tzu was a Chinese military strategist of the fourth century BC. *Art of War* (Ping-fa) was the earliest known treatise on military science and war. It is not clear whether Sun Tzu, the individual, existed. But there are scholars who believe he existed and perhaps was a Chinese general who wrote the core of the book that bears his name probably n BC 512. Whether Sun Tzu was an individual or a scholarly group is unknown.

¹⁵Wing, R.L. (1988), *The art of strategy*. Doubleday. p. 125.

centuries, it is a valid document in strategic appreciation and thinking. Its principles have transcended from military strategy to many other fields. Important among them are management, business, trade, politics, sports and international affairs. These strategies are also being advocated lately by proponents of spiritual issues on how to fight with the evil within.¹⁶ This study only takes the point of terrain specificity and extends it to other terrains for ease of appreciation. The author is sceptic on the serious application of the unitary terrain based on, though consummate, *Art of War* in the present-day warfare and similar conflicts. This is not to question the strategic content of the ancient treatise of wisdom.

Many scholars and experts on the subject have translated Sun Tzu's classic to various languages. These translations, however, have certain variations in the basic principles appreciated by the authors. It is natural in cross-border semantics. Chapter 10 stands apart among all the translations of the diminutive classic by its title that remained common to most of them.¹⁷ Authors Griffith (1963), Giles (1910), Cheng Lin (1969)¹⁸ and Clavel (1998)¹⁹ titled it "Terrain" and amplified the fact that, according to Sun Tzu, the terrain was one of the four elements of detailed planning in strategy. The other elements are the enemy, the self and the weather. "Know the enemy, know yourself, and your victory will not be threatened. Know the terrain, know the weather, and your victory will be complete", Sun Tzu stated in his principles of detailed planning.²⁰

Physical combats that later turned into well-developed and better-organised military operations were the preoccupation of the human systems during the early periods. The battles were fought over land in the days of Sun Tzu barring some exceptions²¹. A war is normally concluded in the primacy of land. The reasons are obvious. Humans cling on to land for survival. It is called the land-clasp syndrome of humans.²² For these reasons, the word "terrain" evolved and established as the "area over the land". The ground as a terrain decided operations based on various factors:

¹⁶Schnarr, G. (2000). *The art of spiritual warfare*. Alchemy. The book speaks about attainment of inner peace by using the principles of *Art of War*. Its relevance here is only with respect to its mention about spiritual security, a filler of the vacuum in apparent security of the humans as explained in an earlier chapter. The practicality of the subject of spiritual security is what is important here.

¹⁷Sun Tzu's *Art of War* is a very short document on military strategy in 13 chapters in classical Chinese literary writing.

¹⁸Wee, C-H., Lee, K-S., and Hidajat, B.W. (1996). *Sun Tzu: war and management—applications to strategic management and thinking*. Addison-Wesley Publishing Company, 1996), p. 297-98.

¹⁹Clavel, J. (ed.). (1998), *The art of war by Sun Tzu*. Delta. p. 50.

²⁰Wee, C-H., Lee, K-S., and Hidajat, B. W. (1996). *Sun Tzu: war and management—applications to strategic management and thinking*. Addison-Wesley Publishing Company, p. 16.

²¹This is based on an assumption that some of the conflicts were linked with sea also during the period of Sun Tzu. But for Sun Tzu, land (ground) was a terrain.

²²According to the author, the land-clasp syndrome reflects in every human activity but is much more amplified in national governance. See Paleri. P. (2014). *Integrated maritime security: governing the ghost protocol*. Vij Books. p.3.

- (a) Compatibility of the ground for operations
- (b) Nature of the ground—open or constricted
- (c) Distances that will affect operational logistics
- (d) Threat from the terrain
- (e) Scope the terrain can provide for operations and manoeuvres
- (f) Tactical advantage of the terrain for attacks and withdrawals

These factors and their transformations are applicable to every terrain that could be identified in the effort to maximise national security. Even then, there is a difference. For Sun Tzu, the term “terrain” was different from the characteristics of a ground.²³ Here lies the deviation in terms of time. A terrain need not be the characteristics of an area over a land. It is a domain. Ground was the medium on which the terrain existed as per Sun Tzu’s appreciation. The terrain was fixed once the operation began. The idea that stands out in this classification is appreciation of the concept of “terrain advantage”—the good and bad aspects of terrain.²⁴ The term is also relative to the players and their visualisation. Once the decision is locked on to a particular terrain, it will have to face the consequences the terrain offers and also facilitate the support the terrain provides relative to the advantage of the player. The threat occurs relative to a terrain. It is also where it has to be settled, well, mostly.

The quantum of terrain property is important for decision-making in governance. The terrain property is the resultant of favourable and unfavourable conditions with respect to a terrain. The expression is relative. It can also be construed that decisions with respect to a terrain and the capability to manoeuvre within its domain will be complementary to terrain advantage. This argument makes all realms of operations as potential terrains for manoeuvres and hence a favoured topic for managing national security. The concept of terrain in national security has a major constant characterisation like in any system with a boundary. It need not be strictly geographical.

Apropos to these statements, there is a caveat. Unlike many scholars on the subject, who are the proponents of Sun Tzu’s principles, in all strategic situations, this study does not consider them acceptable to workout national security strategy. The advocacies are simply not suitable. The primary reason is that this study does not advocate national security as a subject of defeating, but winning. Winning does not mean defeating. A winning plan is not necessarily a defeating plan. In national security, defeating does not guarantee victory. Though the concept of terrain in national security is identical in character with that explained in the classic in Sun Tzu’s name, it is not a land- or ground-based concept. It means much more.

²³ Ibid. p. 24.

²⁴ Here the word “advantage” does not mean positive benefits alone. It also includes disadvantage which in tactical expression is reduced advantage. Terrain advantage when decreases below hospitable limits turn the terrain hostile and, further down, inaccessible. All these can be expressed in a model by indexing the term “terrain advantage” at varying degrees.

5.3 Meaning of Terrain

According to dictionary, terrain means ground, a tract, regarded as a field of view for operations or as having some sort of unity or prevailing character. This is the original meaning. The word terrain came from Latin *terrenus-tera* which means earth, natural features and configuration of land, its topography. Terrain is also a region characterised by common ownership or geographical features. It is an area, field, realm, province, territory or domain. The meanings are many, but all of them underscore the term as an expanse, geographical or otherwise, important for competitive operations or activities.

In Kautilya's *Arthashastra*,²⁵ terrain is a vast area for carrying out open warfare if favourable. A careful study was needed to understand the terrain to make it advantageous in strategic planning. This statement is in agreement with Sun Tzu's observations. But in national security governance of modern times, terrain is a similar dimension with specific characteristics for manoeuvring national governance.

Principles of terrain specificity originated from land warfare.²⁶ The nature of war changed immensely since the nineteenth century. Scientific and technological thoughts and advancements added new dimensions to war fighting. War deviated from land, the original terrain, to other facets. Various types of wars were added to the traditional formats.²⁷ But the basic tenets of warfare remained identical. One of the identifiable commonalities was in the terrain specificity of warfare. Humans became capable of fighting war in other terrains. More terrains came in combo with the original—the land. The concept of unitary terrain shifted to multi-terrain specifics.

From the very beginning, land warfare depended upon topographical elements for tactical and strategic manoeuvres. Sun Tzu is not alone here. Among other period thinkers, this concept was highlighted by Kautilya in *Arthashastra* and, much later, by Clausewitz (1780–1831)²⁸ in *On War*. Land warfare is fought neither in a vacuum nor on a uniformly checkered board. Instead, it unfolds over a tangible terrain, including roads, passages, elevated ground, cover and obstacles of every kind. Though over a unitary terrain, the land, also called the ground, the winning recipe in war since the time it began, demanded thorough understanding and utilisation of the terrain to its fullest advantage.²⁹

²⁵ See Chap. 1.

²⁶ As seen from Sun Tzu's *Art of War*

²⁷ Wee, C.H, Lee, K.S. and Hidajat, B.W. (1996). *Sun Tzu: war and management—applications to strategic management and thinking*. Addison-Wesley Publishing Company, p. 272.

²⁸ Encyclopaedia Britannica. 2001. CD-ROM. Carl (Philipp Gottlieb) Von Clausewitz was a Prussian general who in his works *On War* advocated total war that meant attacking everything about the enemy—territory, people and property. His work is a subject of major study in military strategy. An important aspect of his work is his explanation of *coup d'oeil*.

²⁹ Encyclopaedia Britannica. 2001. CD-ROM.

Understanding the terrain is a decisive factor in any operation. This factor, though very ancient, is applicable even today. Terrain incongruent decision-making can upset the object of an operation. There are many such terrain-bungled operations in history. Clear understanding of terrain specificity is paramount in an operation of any kind. There is an element of terrain incongruent planning behind every blunder in a conflict situation. It is applicable to all the identified terrains and those that may come up in the future.

The specificity of a terrain is relative to the operation. The operation is planned according to the terrain and its specificity. Victory or loss is decided according to the plan of operation congruent to terrain specificity. In national security the terrains are at the macro-specific constituents of the field. That can be explained once the terrain is defined after identifying its characteristics.

5.4 Characteristics and Definition of Terrain

Terrains are purpose specific. That is where interventions take place based on the purpose in any action. The purpose in this study is governing national security. The terrains have to be identified for that purpose. It means defining the terrain for governing national security is essential because the protagonist has to understand the overall field and its differential aspects to play the game of national security at any given time. The field for national security intervention at any time is the realm of human extent or reach for governance. Originally, the field comprised the unitary terrain—the terra firma, where people could exist without any exclusive survival pod or platform. The terra firma was the dry ground and the associated environment—the original terrain and the unitary field of operation for the sapiens of the period. The terrain in its original sense was the geographical lay of the land. It is different in national security studies. The field has widened beyond the unitary terrain with exclusive terrains within systemic peripherals where humans can manoeuvre and negotiate. Humans can reach and operate in these terrains. The terrains are inclusive in application but differentially separated from each other defined by precise boundaries. Integrating the terrains for national security governance is an exclusive and expert task in the widened field of multiple terrains. There are many other terrains other than land today. But they are all centred on the land, the original, where people live, clasp on precariously.

Recognising the constituent terrains of the field of national security for governance is not difficult by their sheer expanse and differentiability in singularity. Characteristics of a terrain are embedded in the latter—differential dimensions contributing to a unified field for a purpose. This study identifies the following characteristics for appreciating a terrain and associated specificity in national security:

- (a) A system entity of expanse within an exclusive boundary capable for intelligent and competitive human intervention for survival

- (b) Corporeal or otherwise with a distinguishing character
- (c) Definable by exclusive features
- (d) Preponderantly distinct from each other
- (e) Absolutely integrable over the whole field of governance of which it is a part, in spite of distinguishing system boundary
- (f) Strategically and tactically decisive for “manoeuvres” in governing national security towards human well-being
- (g) Directly alignable with the strategic interests of the concerned human system
- (h) Qualified “threat attractor” for conflicts
- (i) Capable of closing and opening at will by the players for their respective activities

Accordingly and subject to the conditions laid out by the characteristics, a terrain for the study of national security is defined as, “a domain or combination of multiple domains, geophysical, physical or otherwise, that has the capability to decisively define the governance of national security towards maximising human well-being by influencing the concerned element or elements of national security in the process of governance in an integrated process”.

To quote an example, human mindscape³⁰, considered to be an influencing factor in competitive governance, is not an exclusive terrain for national security as it doesn’t satisfy all the identified characteristics during the period of study. Human mindscape carries the intellectual factor, rather proprioception³¹ of the intellectual self, in support of decision-making in national security governance applicable in all the identified terrains and hence not an exclusive terrain now and not likely to be in the future. It was considered an influential factor in governance in the past, especially during the Cold War period.³²

A terrain, therefore, is not the field but a constituent of the field of national security governance. In ancient times, as mentioned, humans survived through wars and other-than-war situations in the unitary terrain—land. Today there are more terrains. An important deduction here is that a terrain from national security point of view need not be strictly a geophysical entity. It is the overall strategic and tactical

³⁰ Understandably experiments are on by those who can afford to control human mind as part of the usual game of supremacy. The author feels they are wasteful if conducted taking mindscape a terrain of national security (see informational security element of national security).

³¹ Proprioception in the lexicological sense is attributed to the body. It is the sense of self-movement and body position. Sometimes it is referred to as kinaesthesia. It is sometimes described as the “sixth sense”. But here it is used as the general awareness of the body of which “mindscape” is also intricately and absolutely interlinked.

³² The paranoia associated with the mutual destruction at one period in time led the associated forces to engage in huge and expensive research process to use mental faculty for destructive purpose. It was weird. The experiments led to the imagined realms of telepathy, psychokinesis, premonition, witchcraft, paranormal under the title of parapsychology, etc. It is possible that many systems and societies are still engaged in such abnormal behaviour in the normal way. These kinds of activities actually fall in the two laws explained in this study—law of invariance and law of limitations. It also leads to the study of unitary civilisation in a closed and dynamic human system worm tunnel.

space in which the applicable element of national security is manoeuvred in governance. A terrain influences an element of national security decisively. Being a strategic space, a terrain also influences the elements of national security in tactical manoeuvres for attaining the desired objectives. Terrain is fundamentally associated with strategy and associated tactics in the achievement of an end objective, the goal.

Identified terrains fall in the geophysical and non-geophysical categories. While land, air space, ocean and the contiguous space form the four geophysical terrains, deep space, cyberspace, genome and microbiome (presently human microbiome) are the identified non-geophysical playgrounds for hunting down the threats to national security. This is further examined below. Operations in these terrains encompass all activities of human survival through human system governance. Therefore, they are to be governed under the terrain specificity principle. The terrains of national security are mutually inclusive of each other in a continuum context.

5.5 Classification of Terrains

The terrains are classified as geophysical and non-geophysical, where humans are capable of active operations in the process of human system governance towards the well-being of people.

- (1) **Geophysical terrains.** Geophysical terrains are those that are directly associated with the human system in this study. The people and other life forms depend on them for physical survival. They are congruent and directly perceptible to human senses. They undergo dynamic changes under the geophysical phenomena that are continuous. The four-dimensional profile of geophysical terrains comprises the land mass, the ocean, the air space and the outer space contiguous to air space. The geophysical terrains together define the planet Earth from the governance point of view for the land-clasping human system. The geopolitical entities are on land extending to ocean and air space with legally defined boundaries between them. The boundaries are the way they are evolved in history with disputes and all. The contiguous space is a global commons shared by all.

The geopolitical entities will micronise or macronise in course of time as have been before the present day changing “ownerships” and titles under conflicts or agreements. Boundaries between these nations are lines on paper that could become volatile over its geophysical specificity. Disputes are normally over land and sea; air space is collateral to the way they shape up. This can change in course of time. Borders are sensitive entities in a geophysical terrain from the point of view of national security.

- (2) **Non-geophysical terrains.** There are four other identified terrains—deep space (beyond contiguous space), cyberspace, genomic space (genome) and microbiomic (microbiome) space.

The outer space as a non-geophysical terrain shot into prominence years back when humans began venturing into it. Part of it as a relatively infinitesimal where humans venture out and return after the activities is considered geophysical as contiguous space for the convenience of this study as a global commons. It is an interfacial border between air and space. Another terrain is “cyberspace”. According to author James Adams, computers are the weapons, and the front-lines are everywhere.³³ It is a kind of silicon expansion where the world today has potential activities related to both offensive and defensive capabilities. It can also become the focus of nations waging wars.³⁴ The silicon expansion of the cyberspace can be replaced in course of time by more advanced media that may even include live cells. Genomic space is another terrain. It will not be far when humans in search of the secrets of life get entangled within the complicated terrain of genomic signatures and genome security. Another expanding terrain is the complex and presently not-so-clear microbiomic domain, especially that of humans at the moment. Accordingly the terrains are classified as follows before examining individually:

- (1) Land
- (2) Ocean
- (3) Air space
- (4) Contiguous space
- (5) Deep space
- (6) Cyberspace
- (7) Genome
- (8) Microbiome

5.5.1 Land: Terrain #1

Land is the “dry” ground or the dried heights on which humans exercise the land-clasp³⁵ personality, in this study. The land under the sea is the seabed. Land where humans live is the primary terrain for them. Humans perch on dry land. They clasp their land for survival. They were using land for diverse activities since the beginning. The total land area available to humans to clasp is estimated to be 148,940,000 Km². Russia has the largest area (1,708,242 sq km), and Bassas da India, a French uninhabited territory (atoll) in the Indian Ocean,³⁶ is the smallest (0.2 sq km) (2020). It goes under after and during the high water flood and dries up during low water. The smallest country is Vatican City (0.44 sq km), also known as the Holy See. But

land as a terrain is more than just a holding. It is the prime resource for national security as humans can survive only over land permanently. But land does not define the nation exclusively. There can be nations without land (Chap. 1). Such nations are not governable independently under the concept of national security elaborated in this study, hence not a nation for it.

Human psyche is innately associated with land. Land is the most vibrant and sensitive terrain for humans. A person or nation without land is totally dependent on other or other nations for survival. Land is also the smallest of all geophysical terrains with the possibility of reducing further in area. The chances are that it may get smaller as the sea level increases. The land is divided as global commons, national, joint or personal (individual human) property. Land has the unenviable status of being the only terrain that is not comparatively hostile to human existence. In other terrains humans can endeavour only on “platforms”—physical, virtual, scriptural³⁷ or micro and more—designed appropriate for activity and under restrictions of special kind. Some of these platforms are modelled on the vehicles of the land, the familiar terrain. Mostly, the interplay of elements of national security is over land because it is the terrain where people are most comfortable in their natural habitation. Land is the command platform for humans in their quest for national security. The importance of land as a terrain in national security is governed by different factors:

- (a) Ownership—geoproperty rights: whose land is it?
- (b) Contour and geoprofiles: geographical characteristics—high, low, embedded, submerged and so on
- (c) Life sustainability: habitable, uninhabitable, temporarily habitable, hostile and so on
- (d) Historic impact: human activities over land and changing values—ethnic security, demographic security and so on
- (e) Arability: food security compatible and so on
- (f) Resource availability; resource compatible and so on
- (g) Changeability: ethnic compatibility, demographic security and so on
- (h) Connectivity: internal and external and so on
- (i) Environmental compatibility: environmental security, life sustainability and so on
- (j) Threat attraction factors: disaster security, border security and so on
- (k) Vantage lead for threat prevention and pre-emption: strategic application of national security principles
- (l) Geolocation: in terms of resources, climate, human movement and so on

These factors, including the quantum holdings of land—geoproperty rights related to land—have an important role to play in national security governance of any geopolitical entity. Land property is a common contention in conflicts. This is the only terrain that is also owned by people of a nation either as individuals or in

³⁷With scripting statements (client-side script).

groups and not by the government alone.³⁸ People do not own any other geophysical terrains, at least not yet. Human struggles relating to land are notorious in some cases. Most of these struggles have been carefully recorded as part of human evolution through the ages. Many military aspects were related to land property. Their vestiges continue to remain in border and island disputes all around.

Another issue is the ownership of property. It is different under different systems of governance. According to Vladimir I. Lenin (1870–1924)³⁹, the one who held land property was a bourgeois. A big bourgeois was the one who owned a large property. Certain political system advocates that only government will own land. Abolition of private property was the theory of Karl Marx (1818–1883)⁴⁰ and Friedrich Engels (1820–1895)⁴¹ as per *The Communist Manifesto*.⁴² In some systems land is owned collectively. Each system has its own arguments that ultimately points out to human welfare. In a kingdom, seldom the common people owned land as freehold. There were multiple owner identities.

Humans settled down in concentration in the so-called Neolithic revolution that witnessed growth of towns and cities. Land was reclaimed, where possible, from seas and forests for cultivation. They were owned by the residents under communal distribution. Land placed pressure on energy and capital. Technology replaced animals, and where it did not, the animals continued as cheap sources of energy. Where cost was important and animals scarce, there was alternate use of energy. An example is the windmills of Holland. There was no limit to human innovation through seemingly simple but extraordinarily dynamic individual perception. It was not just the crops, but even intellect originated as the way of life from land. And soon population threatened to outstrip all that was made.

The sense in communist ideology that individuals have no right to land property stems up from the fact that the land is not made by human beings. They inherited it. It belongs to the entire species as a common property according to the ideology. That is how the oceans are visualised today—global commons. It is not known how the outer space and distant planets will be seen one day from the point of view of the individual, group or government ownership rights. But in course of time, this reasoning may not stand. The force is lost in human needs. The people who came early took over the land. No space is left for the newcomers unless they pay and buy

³⁸There may be in this statement based on faith and belief systems of people.

³⁹Encyclopaedia Britannica. 2001. CD-ROM. Vladimir Ilich Lenin was the founder of the Russian Communist Party (Bolsheviks) and the revolutionary leader in the Bolshevik revolution (1917). He was the first head of the Soviet State (1917–1924).

⁴⁰Encyclopaedia Britannica. 2001. CD-ROM. The author of *The Communist Manifesto*, the most celebrated document in the history of socialist movement.

⁴¹Ibid. German socialist philosopher and the closest collaborator of Karl Marx in the foundation of modern communism.

⁴²Ibid. Today communism does not insist on a communist (believer in communist ideology) not holding private land as it is not practical to follow such manifestos.

the land from those who already own it in eight continents.⁴³ Common properties are owned by the state. The state may sell them in certain cases or acquire from private holders in some other situations. It is a flexible scenario. States have sold or gave away land to other countries as extension of their borders or as a place for their settlement for official or diplomatic businesses within their geoproperty perimeters. Antarctica is an exception. Most part of Antarctica is frozen freshwater ocean.

Property rights are not supreme. They go in tandem with human rights which takes precedence when there is a conflict.⁴⁴ The right to property in Global Human Rights Law is declared by Article 17 of the Global Human Rights Declarations, 1948. Everyone has the right to own property alone as well as in association with others. No one shall be arbitrarily deprived of his property. Property rights depend on the principle that one owns oneself and that of his or her labour too. This also shows the deviation between human rights and communist ideology that the land is owned by the party and not the people individually. Property rights are fundamental to human existence.

The observations of the US Supreme Court Justice George Sutherland sum up the human being vs. property debate effectively. “It is not the right of property which is protected, but the right to property. Property, per se, has no rights; but the individual—the man—has three great rights, equally sacred from arbitrary interference: the right to his life, the right to his liberty, the right to his property.... The three rights are so bound together as to be essentially one right. To give a man his life but deny him his liberty is to take from him all that makes his life worth living. To give him his liberty but take from him the property which is the fruit and badge of his liberty, is to still leave him a slave”.⁴⁵

Land firmly establishes the relationship between the individual and the geo entity of his existence whether he or she owns a part of it or not. It can be called the state-individual citizen relationship. It is here nationalism becomes an assertion of preferential rights. Land, as property, is also associated with national power. In economics land is one of the factors of production. Territory and population can be called as the critical mass in power equation. A nation or its people without land are denied this power. Land reforms are basic political-individual relationships. It is a property-focused strategy in national security. This is especially so when the land is at a premium. An example is Israel. The Zionist leadership has acquired settlement areas for furtherance of agriculture and, of course, national solidarity and power.

⁴³The eight continents are Africa, Antarctica, Asia, Australia, Europe, North America, South America and the new one: Zealandia. Zealandia comprises New Zealand and New Caledonia comprising French overseas territories. Zealandia is considered the eighth continent according to certain studies based on the characteristics of a continent: elevation, crustal structure, geology and total area and structure limits.

⁴⁴Demarest, G. (1998). *Geoproperty*. Frank Cass, p. 22. As quoted by Theodore Roosevelt, in his 1910 speech at the university of Paris on 23 April 1910.

⁴⁵Foundation for economic education. (2014). “Human rights are more important than property rights”. <https://fee.org/articles/9-human-rights-are-more-important-than-property-rights/>. Accessed 12 February 2020.

Much of it was reclaimed land. Large areas were classed as state property. In this game, Palestine became a failed experiment of the British. The British understanding was to have a Palestinian identity with integrated Jewish and Arab identity. Little they knew that was impossible since the Arabs had a nationalism to keep intact while the Jews had a historical identity to retain.⁴⁶ The national and religious polarities are also factors that will infringe integration of two different systems. The law of limitations is at play in such cases. It is surprising how the British miscalculated the alliance of people with entirely different genesis in spite of their globally acquired astuteness. Land, shortage of it, is the key stake basket in this conflict. It is terrain based and perhaps the best example of terrain specificity and its importance in national security.

A major question surfaces here. How much land does a nation need? What should be the type and quality of the land? What is the optimum size? How is it calculated? How much should the government own? What should be the proportion for arability, urban limits, industrialisation, environment and other needs? In the olden days, it was presumed that the more the land, the more the power. It may still be perceived that way. But, then, how did the British Empire and other empires collapse? Was it because of more holdings than what could be managed or because of other reasons in which over holdings too reflected? This can be examined through various models. It is not attempted here. But the concept of national security, in accordance with its definition, does not fluctuate by land acquisition and holdings. It is not necessary that the NSI of a nation will be proportionate to its land holdings. But still will it have an impact? Can that be assessed? Yes, the author believes so.

The next question is which land area in the world is the best for setting up a nation? One would have heard about the “promised land” and so on. Does choice of location to set up a nation matter in national security? These questions are only hypothetical. As long as a nation state is in existence, in whichever form it may be, it is its exclusive responsibility to govern its national security concerns in the best possible way towards maximisation. It is possible. In that, the land terrain is one of the playing fields. Within this paradigm lie the questions: how much land an empowered nation needs for maximising national security, what is the optimum, and what type of land? Answers can be varied.

Human existence is fixated to land. Disputes over land holdings separate individuals, families, communities and nations. It often turns violent as clashes or agitations that need intervention of state and, sometimes, international organisations. Land disputes are not just border disputes but also disputes over resources. Water is an example. Expropriation of the land for public use is another cause of dispute within a state. The same goes with pastoral land. Pastoral life is not nomadic. Still these people are called nomads in some parts of the world. For them, the cattle are

⁴⁶Demarest, G. (1998). *Geoproperty*. Frank Cass, p. 172

important—like the transhumant people, the Barabaigs, of Neyrere's⁴⁷ Tanzania. Food comes from cattle. East Africa had one of the greatest communes of pastoralists. They became endangered for reasons not recorded clearly. The cause was made to be developmental projects. For a pastoralist, the guiding principle is land, not development or money, because land nourishes their cattle that in turn nourishes them.⁴⁸

The closeness of humans to their land in whatever hierarchical status they are is an important issue in their welfare. People are attached to their land physically, mentally and emotionally irrespective of their position and geographical location. They are close to their land and next to their environment. Take them away, the humans suffocate. In places where land or environment is not available, they will find it symbolically. The trees are dwarfed so that they can be kept on their windowsill. They are called the bonsai. The trees may not grow, but the art becomes a massive industry and an expert field of human creative activity. There is no problem even if the objects of land-based nature are made of plastic, clothes, paper or any other suitable material. They are displayed in a city skyscraper to bring the feel of land that the humans cannot separate from their psyche. It is too close to their consciousness, and they become restless when a threat is envisaged to their earthly possessions, imaginary or otherwise. Their well-being depends upon protection of their land and environment more than anything else. The terrain is strong and inseparable in their psyche. People all over the world are also close to their native land even if they were not born there, because their ancestors are buried there. People separated from their place of birth are conditioned in the early years of their life to be close to their land where they grew up. Under this argument, for some, there may be a duality in their mental land holdings. Any attempt to sell, divide or ruin by development means violation of their souls.

There are traditions followed by people that no government can understand in its developmental planning. Developmental planning can be interpreted as exploitation. Construction of a dam that may bury villages under water can be heart felling to people who live there. It is painful for people to vacate their land where they and their ancestors lived for many years. A government planner may not understand such feelings. The feelings are emotional and emotions affect well-being. No local "Barabaig" will be able to express the feeling. They can only resort to aimless agitation under opportunistic or insincere leaders from elsewhere for their agony in the name of development. Development sans well-being has no place in national security. Quantifying the feel of earth is impossible in economic theory. Pearl S. Buck's (1892–1973)⁴⁹ classic *The Good Earth* just draws a line under to show

⁴⁷ Encyclopaedia Britannica. 2001. CD-ROM. Julius Neyrere (1922–1999) was the first prime minister of independent Tanganyika (1961). His name, the author feels, is permanently associated with the country. Hence the usage, Neyrere's Tanzania.

⁴⁹ Encyclopaedia Britannica. 2001. CD-ROM. Pearl S. Buck was an author noted for her novels on China. She was awarded the Nobel Prize for literature in 1938.

what the concept of land is for humans in their drama of destiny.⁵⁰ The land is at the centre of every class struggle, conflict and decline. For all these reasons, land becomes the primary terrain for national security. Everything that happens is centred on it.

Partition of land territories can bring havoc in the ethnic psyche of the human population. Their behaviour patterns will change beyond normal. An example is in the partition of India in 1947. The injuries the partition caused to the Indian psyche will remain for centuries, probably they will never heal. They will transform and reflect in everything they do geostrategically and socially. Partition and subsequent displacement under coercion from the land one owns have their better sides too. Majority of such people become more determined and persevere for better opportunities in life, which perhaps would not have been there in the original place. Those who survive the distortion of partition succeed in every respect in their chosen locations.

Land reform is a purposive change of the use of land for agricultural and associated economic measures adopted by a government. It is nothing new. The early Greek and Roman empires, as early as the sixth century BC, had introduced land reforms.⁵¹ The land when reformed also brings deviated purposes. These deviations can cause more harm than benefit. Though reforms are meant for solving problems, they may induce problems if carried out with deviated objectives. Reforms are closely associated with land tenure that indicates the title and ownership conditions. Sociopolitical objectives of land reform are to abolish feudalism, liberate peasants and support democracy. It may, however, avoid revolts by peasants. But in general, reforms are aimed at upliftment of peasant condition. But do they really serve this purpose? The experience shows land reforms are not ultimate in resolving issues. They have to be associated with additional compatriot reforms.

It was the French Revolution that expedited formation of nation states that brought a new era in land reforms. The feudal order was abolished. The reforms over the world since then have not been unilateral or identical. Each nation had its own contribution in the principles of land reforms. The degrees of seriousness varied. While the intermediaries were abolished in India and Pakistan, China introduced village communes. In Latin America, it was based on the primary plantation economies and small units. The United States' paranoia on communism was strongly reflected in Japan's land reforms and their Southeast Asian partners. The Japanese reforms were governed by the allies who occupied it after the Second World War II. It was maintained to make it an industrial economy with high literacy

⁵⁰Buck, P.S. (1943). *The Good Earth*. Jaico Publishing House. Wang Lung, the key character of the book, rose from a simple unpretentious Chinese farmer to a wealthy landowner, glorified on the earth he worked that was more important to him than everything else. But between his love for his land (the terrain) and life stood every perceivable constraint—flood, draught, pestilence and revolution included. The book traces the cycle of life of the Chinese peasant and his family against the terrain of earth from the viewpoint of a peasant. Life ultimately ends up with meagre rewards against the agony. Wholesome well-being has its limitations and it performs on a terrain.

⁵¹ Encyclopaedia Britannica. 2001. CD-ROM.

rate. It suited the United States' interests. The objective was to sustain political order, lest they should fall under the grip of communism. In the Islamised Egyptian society, the land was divided into private and *waqf*⁵² ownerships. The *waqf* land was inalienable, whereas private property was speculated and tradable. Land reforms were different in Mexico. The reforms were early twentieth century with the revolution and were based on conversion of the lands of the aborigines to plantation and based on abolition of serfdom.

How much the land reforms all over the world have contributed towards its primary objective of agrarian revolution and making the peasants free and independent is not a question here. The aim is to establish the importance of land as a primary terrain in the national security of a country. Reforms were not just land tenure and land distribution. It is much more than that dealing with total revolution in agrarian land usage—the primary principles of national security are hidden here.

It was asked earlier—"How much land does a nation need?" There is no more land available for ownership. Is excess land an advantage unless it is resource specific? What if the land available to a nation is considered short? Can extra-terrestrial ground space—multi-city towers, city ships, ocean cities, reclamation, etc.—resolve the issue? These questions also may not be valid in national security since the age of aggressive land grabbing by countries is almost over. What is left now is disputed territories at certain border areas. Can nations consider selling their landholding like the way Napoleon (wisely for him) sold off the French area in 1803⁵³ and the Mexicans (unwisely, though under intimidation and coercion, as they may be introspecting now) sold off New Mexico to the United States in 1846? It needs serious research. It is a question a nation has to ask itself: "Does it have optimum land territory?" Can it purchase land from the neighbourhood owner state to resolve border issues as well as to balance shortage? Politics and time play heavily in these situations. The win-win situations, if any, in such dealings under geoproperty rights will naturally be attributed to the political advantage and not that of national security.

The next one is ocean, the terrain humans got into after living for a very long time over land.

⁵² *Waqf* is an Islamic endowment of property to be held in trust and used for a charitable or religious purpose. It also means a Muslim religious or charitable foundation created by an endowed trust fund.

⁵³ Encyclopaedia Britannica. 2001. CD-ROM and www.gatewayno.com. The purchase of Louisiana from Napoleon's France on 30 April 1803 was an important event for the United States with great strategic advantage. It was the greatest land bargain in US history. 2,144,520 sq km of land was purchased at less than 3 cents per acre. At the same time, it was the best sell for Napoleon. He needed money and troops to face renewed war with Great Britain, and Louisiana was of not much use in his strategic plans.

5.5.2 Ocean: Terrain #2

It is estimated that oceans formed about 3.8 billion years ago on the planet over its crust which later became the land (Box 5.2) as extended drying heights mentioned as Terrain #1. It was a long time ago. Life came much later. Humans appeared last, as if yesterday. Today these drying heights stand exposed to flooding as an extension of ocean if seawater rises.

The maritime dimension of the world is embedded in the terrain specificity of the ocean. Understanding the ocean, on its own, is an exciting journey through time. There are many ways to understand the ocean vis-à-vis the Earth and human system. One of the ways to understand the importance of the ocean is to observe in antiquity the story of the Trojan War, Greece against the powerful empires from Asia, the nineteenth-century England against Napoleon, the United States and its allies against the Soviets and Red Chinese empires in Eurasia and other gargoyles of maritime history of the world. Even if the Trojan War was an epic narration, it was across the sea presumably around 1250BC.⁵⁴ It is mythically told that more than a thousand ships were involved in the massive sealift of the period. For the United States, the Second World War started and ended with a fleet.⁵⁵ Increase in effectiveness of strength based at sea applies to almost every new development in the world. Sea power has decided all world wars so far. The total power of a nation or coalition as in the world wars can only be projected by sea. Sealift is the carrying concept of strength at sea. The ocean has profound influence on every maritime nation of the world in military and geostrategic spheres alone. According to *Jane's Fighting Ships*, in 2000, there were 163 navies in the world including the North Atlantic Treaty Organisation (NATO) that was considered a separate entity in terms of power.⁵⁶ National dependence on the seas is not a unique phenomenon; it is historic in concept and idea. Military aspect of the seas is just another edge of it. Based on a study by the author, there were 107 navies and 143 coast guards in the world (2019).⁵⁷

But in the early days, the ocean was not as expansive as they are today. Humans were virtually confined to land in the tropical and temperate climates for many years. The ocean was at a very low level around 20,000 BC. People could walk across today's continents, as they were one stretch of vastness.⁵⁸ Today's busy seaports were dry lands far from the open sea. People who lived near Shanghai, Singapore

⁵⁷Paleri, P. (2009). *Coast guards of the world and emerging maritime threats*. Tokyo: Ocean oily Research Foundation. P. 136. The 143rd coast guard was not included in the book. It came up in Sri Lanka in 2010.

⁵⁸Blainey, G. (2000). *A short history of the world*. Penguin Books. p. 24.

and Sydney never saw the sea.⁵⁹ But, according to human history, remarkable change began around 15,000 BC when the summer and winter became warmer. Ice around the world melted rapidly between 12,000 BC and 9000 BC. According to compiler Rodney Castleden's *World History*, the sea level rose by 40 m by 13,500 BC.⁶⁰ Large areas were flooded. People watched the sea level persistently rising. They could never figure out that the reason was global warming. It was not cyclic rising and retreating. It flooded the low-lying areas. Rivers changed courses. By 7500 BC, the seawater rose to the level that was about 30 m below the present altitude and continued to rise rapidly. By 3800 BC, the level reached 8 metres below the present level.⁶¹ The temperatures immediately were higher than they are today.⁶² According to author Geoffrey Blainey, the sea rose as much as by 140 metres with the rise in temperatures during the prolonged period, though he states the rising was complete by 8000 BC.⁶³ In his assessment, it was the most extraordinary event in human history during the last 1,00,000 years. It was far more influential than all the combined events of the twentieth century. The rising seas transformed human life forever. The ocean terrain came to stay and influence human life considerably thereafter. It also has the potential to extinguish majority of life on Earth one day if it further rises uncontrollably. There is only 29% of earth left for habitation. It could reduce further by sea-level rise.

Oceans cause proximity and isolation—the powerful determinants of history.⁶⁴ Today, oceans cover 360 million square kilometres, about 71% of the Earth's surface. The land adjoining the oceans has a total coastline of 504,000 km (continuously changing).⁶⁵ Though the sea appears to divide the nations, from a different perspective, it unites them geographically. It binds the continents. It is a medium that humans have ventured out for centuries to discover, conquer, trade and harvest. The average depth of the ocean is 4 km. It is a common challenge. Those who traversed it depended on each other, helped and developed special bonds.

The contents of oceans of the world are yet to be calculated accurately. It is expected to contain:⁶⁶

- (a) 328 million cubic miles of water
- (b) 58 species of sea grasses
- (c) 1000 species of cephalopods: squids, octopi and nautilus
- (d) 1500 species of brown algae
- (e) 1000 species of sea anemones

⁵⁹Ibid., p. 25.

⁶²Ibid., pp. 30–31.

⁶³Ibid, p. 31.

⁶⁴Ibid., pp. 41–43.

⁶⁵Discovery Channel, TV Quiz, 2002.

⁶⁶Compiled from the Internet, Food and Agriculture Organisation (FAO) and Indian Coast Guard sources.

- (f) 7000 species of echinoderms: starfishes, sea urchins, sea cucumbers and sea lilies
- (g) 13,000 species of fishes
- (h) 50,000 species of molluscs
- (i) Oil
- (j) Gas
- (k) Metals
- (l) Minerals

The facts about the oceans are yet another way of understanding them.⁶⁷

- (a) Global fish production exceeds that of cattle, sheep, poultry or eggs and is the biggest source of wild or domestic protein in the world.
- (b) Two-thirds of the phyla, the major grouping below the kingdom level, are predominantly marine.
- (c) 85% of fish landings in 1985 were marine.
- (d) 15 of the world's 17 largest fisheries are over fished or in trouble.
- (e) Less than 30 of the coral reefs in Japan, the Philippines and Costa Rica are in good or excellent condition.
- (f) The great auk, Steller's sea cow, Panamanian fire coral, San Diego mud snail and eelgrass limpet are now extinct.
- (g) The ocean floor is an exact replica of land.

From the point of view of national security, the following oceanic components are identified as the factors that historically contribute to the development of the regions around the oceans:

- (a) Ocean resources
- (b) Ocean advantage
- (c) Ocean environment
- (d) Oceanic islands

These components are jointly classified as "ocean property" by the author in a research carried out to study the maritime component of national security.⁶⁸ Threats to ocean property of a maritime nation can affect its national security. Maximising ocean property is the objective of maritime security for a maritime nation. Today, the world is aware of the importance of the oceans for life on Earth. It was with this purpose the United Nations declared the year 1998 as the "International Year of the

⁶⁸Paleri, P. (2002). "The concept of national security and a maritime model for India". *Doctoral dissertation*, Department of defence and strategic studies, University of Madras, India. p 137. First introduced by the author in his article, "Maritime Security and the Concept of Ocean Property", *Journal of the Society for Indian Ocean Studies*, Vol. 10, No. 1, April 2002, pp. 15-25, and subsequently in his book, (2004), *Role of the coast guard in the maritime security of India*, Knowledge World, pp. 90, 103-107. The concept of ocean property constitutes ocean advantage, living and non-living resources, ocean environment and oceanic islands that a nation has under its sovereign rights.

Ocean". Oceans will remain critical for national security of maritime nations. The ocean, by itself, is a unique terrain. It is over the land but not the land. It makes the planet look round and blue, though the real planet is a rock shaped by gravity. It is heavy but still supported by the ocean bed under varying heights of the water column. It is multidimensional. It has the surface, the ocean layer, interfacial zones with air and land, the deep abyss and the floor—the seabed that takes the varying pressure exerted on it by the water column as well as the air column above the surface. Wealth and stealth are the key factors of the oceans. The stealth factor has been greatly advantageous for military security from the time of the submarines. The submarine is a weapon by itself to counter asymmetric threats. It proved its worth as the classical *guerre de course*.⁶⁹ Submarines can penetrate deep littoral waters immune to nuclear, biological and chemical warfare, if well equipped with counter-measures to face the threats of attack submarines and mines. They can provide an efficient platform for a counter-attack on the second strike mode for balance of power in a nuclear scenario and force the world to resort to conventional warfare. A submarine is a unique combination of mobility, stealth, endurance and versatility for offensive operation. Surface and air forces are more vulnerable than submarines. Ocean is the only geographical terrain that provides such advantage of stealth.

Box 5.2 Isn't Ocean Part of Land?

Technically, yes. Ocean has a bed like a riverbed deep down along gradients on ocean floor. The bed can be probed for resources for human survival depending upon technological feasibilities. The Earth is covered by the "land" over the crust surface, which actually is the land. This can be seen from the cross section of Earth passing through the centre. Ocean from this perspective is part of inundated land over the planet. This also means ocean covers three-fourth of land area on the planet. Ocean has specific characteristics when compared with other water bodies called lakes, rivers and so on that cover other parts of land. For example, ocean water is saline and contains minerals and dissolved gases with relatively high pH values. The law under which the ocean is governed is different under international law and appropriated domestic law. Ocean doesn't have to be large or expansive. There are water bodies over land that is similar in characteristics to the expansive ocean. They were part of the prehistoric world ocean. But from the national security point of view, ocean is a different terrain and thereby different from land terrain. It is the first terrain into which humans ventured when they learned to make a live-in vessel.⁷⁰

⁶⁹Meigs, M.C. (1990), *Slide rules and submarines*. National Defense University Press. p. 3.

⁷⁰Evidences suggest Neanderthals took to water in boat much before humans did. Bob Yirka (1 March 2012). Evidence suggests Neanderthals took to boats before modern humans. <https://phys.org/news/2012-03-evidence-neanderthals-boats-modern-humans.html>. Accessed 20 August 2020.

5.5.3 *Air Space: Terrain #3*

Humans were so preoccupied with the land for their survival that it took them ages to understand that the oxygen they were breathing came from the air space over it. They never realised the importance of air space as a terrain and its impact over them for their existence. Today, people know more about it. The air space envelops the world as its armour. It is over the land and the ocean over it. No life form on Earth can survive if exposed to the vagaries of the sun. They need to be clothed by air space. Even a small opening in this garb can invite deadly consequences. And, the day the robe vanishes entirely, there will be the ultimate apocalypse.

Since the time the Wright brothers⁷¹ created a vehicle heavier than air but could move through it by levitating under speed, the air space never remained the same. An aircraft provides the virtual “high ground” in the dimension of air. Invention of a flying machine that was heavier than air was an event in the process of accelerating the rate of change. Air space became an element of national power. Airplanes and air warfare, commercial transportation and all other activities changed the world. Air space has its own threats from the point of national security. The world’s most daring terrorist attack so far came from air space on 11 September 2001 in the United States.⁷² For the terrorists, it was a matter of “knowing” the terrain: the air space. It was this knowledge that helped them to manoeuvre freely without resistance in that terrain. Understanding the terrain was much more critical than learning to fly a commercial airliner. They studied it painstakingly before the act.

Air space is not a security terrain alone. It is the churning machine that produces climate variations, though it originates from the oceans. Air pollution is a major cause of concern for the communities, because the impact can be felt beyond the point of origin across national boundaries. The environmental security of a nation can be seriously hampered by air pollution even if the origin of its cause is somewhere else. Air space is the only terrain that has continuity with all the geographical terrains. Each interface is peculiar by its own characteristics. While the land terrain is uneven and spread with characteristics of profiling, air space is with respect to interfaces and varying associated physical and chemical characteristics.

Air space also governs other factors related to national security elements. For these reasons and identifying other realms of operation for the humans towards national security, air space is considered as one of the geophysical terrains. In aerial warfare, the control of air space is essential to control land. In a situation of war, there is a need to destroy the air power of the enemy. A terrain, therefore, is complementary to another. Air space can also be closed or brought under regulations, as in Iraq after the Gulf War or in the United States in the aftermath of the 2001

⁷¹The Wright brothers, Wilbur (1867–1912) and Orville (1871–1948), invented and flew the first practical airplane on 17 December 1903.

⁷²In this attack, terrorists crashed their hijacked airplanes against the World Trade Center in New York and the Pentagon in Washington, DC, causing heavy casualties and spreading terror.

terrorist strikes. Air space has been visualised as a terrain with an advantage much earlier in military aspects. Military security was overwhelmed by the term “air power” coined by Douhet Giulio (1869–1930)⁷³ an Italian army general trained in artillery. He brought a revolution in utilising the air space as a terrain of advantage and was later known as the father of strategic air power that too when his contemporaries were mocking at the idea.⁷⁴ He propounded the theory of air power and enhanced its applicability in the face of tremendous resistance. Because of his efforts, strategic air power became an accepted part of military thinking. He advocated creation of an independent air force and unification of armed forces besides reduction in ground and sea forces. Some of his ideas were followed and some dismissed.

Air pollution affects humans directly and indirectly. Its effect could be immediate and long term. Pollution level depends upon the extent the agents can be transported. More indirectly, passive air pollution is experienced miles away from the source. Air space provides the armour for the greenhouse effect—in simple terms it means the potential increase in the average global temperature. This happens with an increase in carbon dioxide level when the Earth’s surface and lower atmosphere get heated up. Air space is Earth’s atmosphere. It allows large part of the sun’s visible light to reach the Earth and heat it. A part of this energy is reradiated as heat, invisible longer wavelength infrared radiation. Much of this radiation is absorbed by carbon dioxide and water vapour and reflected back to earth as heat. This is analogous to the greenhouse where the glass panes let in light but hold the heat. The greenhouse effect is required to keep the Earth warm and to prevent an ice age situation where even the oceans can freeze. The temperature could be as low as -70°C . Alternate to that is the runaway greenhouse effect where the temperature can soar and melt the ice caps causing floods that have never been seen before by the modern human. Temperatures can soar as high as 500°C . The temperature of the Earth will increase if the greenhouse effect gets out of control. And, all these will happen in the air space transmitting to the land and ocean terrain. The immediate result before the ultimate ice age will be climate change. A modest prediction is that the temperature will rise by 5°C by the middle of the twenty-first century. The polar ice caps will melt raising the level of the oceans. New patterns of draught and rainfall will result. Food production can fall. All these are based on the changes in a single terrain—the air space.

⁷³ Encyclopaedia Britannica. 2001. CD-ROM. Douhet Giulio was in charge of Italy’s first aviation unit from 1912 to 1915. He was responsible in getting the three-engine Caproni bomber for the unit during the First World War. He grasped the potential of air power and used it wherever he could. He was court-martialed and imprisoned for being a critic. But when the Italian defeat in the war was analysed, it was found that Giulio was damn right. His conviction was reversed and appointed head of aviations service.

⁷⁴ Advertisement by the Confederation of Indian Industries, *The Hindu*, Chennai, 7 February 2005, p. 21. Marshall Ferdinand Foch (1859–1929), the French strategist, was quoted as saying in 1911, “Airplanes are interesting toys but of no military value”. He was the commander of the allied forces at the closing end of the First World War and much credited for the allied victory.

5.5.4 *Contiguous Space: Terrain #4*

Contiguous space is taken as a geophysical terrain and a global commons for this study because it is related to the human survival systems in the physical world. It is the band of outer space directly used by the global communities as a global commons adjacent to the geophysical terrain of air space and extending from its outer limits into outer space as far as the global nations agree by consensus for the purpose of segregation of terrains for national governance relative to the planet Earth. The outer space otherwise is a non-geophysical terrain because its features are distinct from that of the earth. But it is considered geophysical only from the perspective of national security governance, and this study urges the nations to consider it when an international law of the space related to ownership and exploitation rights is ever prepared on the subject by a recognised global authority.⁷⁵

The contiguous space for this study is separated from deep space for the convenience of human system governance on Earth at any given time through global legal understanding. This classification can change subsequently. Within the contiguous space, the nations together may exercise authority to govern their national security matters respecting the principles of global commons under international law.

Space has become an important component of the international world in strategic thinking since 1957 when the first artificial Earth satellite was launched.⁷⁶ In the twenty-first century, space systems will be under the nexus of economic, diplomatic and military elements of national power.⁷⁷ Therefore, it is a terrain by itself. Efforts are there to control this medium by various nations who are developing the requisite capabilities for it.

5.5.5 *Deep Space: Terrain #5*

Deep space (Box 5.3) is the vast expanse of outer space beyond the contiguous space in the outer space where outer space is the physical universe beyond Earth's

⁷⁵ A possible UNCLOS (United Nations Convention on the Law of Space) on space similar to United Nations Convention on the Law of the Sea (UNCLOS) is just a thought about idea here. The base line or the altitude as well as the variable extent of contiguous space mentioned here and the limit of heliopause for the event horizon of interstellar space are prime matters for the future terrain specificity to avoid clashes and conflicts. There cannot be territorial space but space can be considered geophysical in the contiguous part which can extend to heliopause in centuries from now. The space between contiguous outer space and heliopause from where the interstellar space starts will be required to be defined legally as human interventions are increasingly visible and outright in space. Interestingly relative to space the ocean remains a bigger mystery for humans today.

⁷⁶ Institute for National Strategic Studies, *Strategic assessment 1999*. National Defense University. pp. 301–308.

⁷⁷ Ibid. p. 301.

atmosphere. The outer space is a vast continuum of a different dimension and perception. It borders air space into infinitude at the current level of human erudition. This aids Earth-centred perspectives of the study since it is about the well-being of people on Earth as citizens of different geopolitical entities. Hence the outer space is seen from the Earth—outward as a terrain.

Box 5.3 Clarity of Perception: Contiguous Space and Deep Space—National Security

The term contiguous space in relation to outer space is not expressed anywhere else except in this study with the meaning as the band of outer space extending into deep space where human activities related to national security governance are extendable without terrain limit until such limit is consensually defined under international law. In the absence of a definition or related regulations under international law, a nation may decide its limits as required for its national security requirement without prejudice to the requirements of any other nation maintaining the good order and discipline of outer space as a global commons for governance.

The term deep space is used for that part of the outer space that extends from the contiguous space and is used for exploratory studies with exclusive scientific intentions that is projected and not related to the direct national security governance of a nation. The terrain definition of deep space, thereby, differs from the existing exploratory definitions. For example, International Telecommunication Union (ITU) defines “deep space” to start at a distance of 2 million km from Earth’s surface, whereas National Aeronautical and Space Administration (NASA) used deep space criteria of 16,000–32,000 km from Earth. In some contexts deep space also refers to interstellar space. The study here is limited to national security governance. The definitions are subject to change in the future.

5.5.6 Cyberspace: Terrain #6

The root “cyber” originated from the word cybernetics meaning the theoretical study of control processes in biological, mechanical and electronic systems. Cyberspace was an imaginary domain originally invented by a science fiction author (1984), William Gibson, and mentioned repeatedly in his writings. It was only a matter of time when the domain became a reality with the advancement of information technology and reaffirmed with the introduction of the greatest web of all so far, the Internet. Cyberspace, in the imagination of Gibson, was a computer-simulated reality that showed the nature of information, foreshadowed by virtual reality technology. It is considered his major contribution to the genre.⁷⁸ In the initial

⁷⁸ Encyclopaedia Britannica. 2001. CD-ROM. It appeared in Gibson’s book *Neuromancer* (1984).

days of his publications, the term cyberspace was widely discussed and debated in public. By 1995, there was a growing consensus that cyberspace could significantly affect the structure of nation's economies, the development of communities and the protection of citizens.⁷⁹ The boundaries of cyberspace are still expanding to envelope human activities of all sorts. In this matter cyberspace for this study qualifies well as a non-geophysical terrain for national governance.

Cyberspace is an expansive terrain within the realm of computers, more specifically monolithic integrated circuits on semiconductor platforms. Today they are in computer chips.

The cyberspace is a new existential dimension, hence a terrain, a virtual world of computers. It exists in the realm of computers. It is a notional communication environment over computer networks. The biggest and most familiar network is the Internet. Cyberspace describes a widespread, interconnected digital technology. The term entered the popular culture from science fiction. It is real today and lies within the scope of the Internet and more.

People know what cyberspace means. The vehicle is the computer, and the terrain dimension presently is inside the silicon chip and associated configuration, and the driver is the software programmer who is needed to get into the terrain dimension.

5.5.7 *Genome: Terrain #7*

Genome is more recent, though with an early beginning. It is a terrain within the body of a living thing that keeps records of its lineages and instructions for centuries and more. It is the hereditary information of the organism encoded in a sort of "time capsule"⁸⁰ what the experts call a DNA⁸¹ or for some viruses, RNA⁸². The genome of a haploid chromosome set is merely a sample of the total genetic variety of a species. The genome has records of the human being identical to those today that walked the Earth in Central Africa 60,000 years ago. It has records of the Mongol conqueror Genghis Khan's (1162–1227) spin-offs from his genetic conquests in the world after years of his departure.⁸³ Genetics grew as the cutting-edge science only recently. But it has opened up a rare insight into a never-seen-before terrain that may affect the future of humans in a way that was never envisaged. It is the terrain of the genome.⁸⁴ Genomic studies will reveal the truth of the original father and mother of

⁷⁹Ibid.

⁸⁰Author. DNA is much more.

⁸¹Deoxyribonucleic acid

⁸²Ribonucleic acid (in certain viruses). Viruses are noncellular.

⁸³It is important to mention here that there are no specific records of Genghis Khan ever indulging in rape or abnormal procreative pastime during his conquests. He respected women, some say.

⁸⁴The author feels that the terrain of genome is just the beginning of diversion of terrain specificity into the biological realm. It is poised to grow further in the distant future where the entire aspect of

the entire humankind. And also about the ancestors that followed them. The studies so far reveal that there was a real father and mother of the entire humankind. But what is fascinating is that the mother came first—about some 150,000 years ago—and the father followed her after another 80,000 years. They never met. There was no need for the original father to meet the original mother in the sexual politics of the genome. Intriguing?⁸⁵ Yes. Never before there was a terrain that was more gripping in suspense.

The future of the world may perhaps lie focused in this terrain, and it will be the next revolution in human development after information technology and knowledge age that the world is currently creeping through. It will be amazing and dangerous to tread at the same time. The revolution is just waiting to explode. Genome is the microworld of DNA—deoxyribonucleic acid that carries information, which determines individual hereditary characteristics. The DNA is identical for all organisms. It is the sequencing of the DNA that makes the difference between the organisms. The genome is an organism's or, more specifically, a life form's complete set of DNA. That is the terrain the humans are invading for knowledge about the process of life itself. They have made enviable progress in this regard making the genome a separate terrain itself as the playground where the need to be monitored strictly to avoid unexpected consequences and to games creates situations by which life can be made more comfortable.

5.5.8 *Microbiome: Terrain #8*

Presently, biomic space or biome is a mystery terrain for matters of national security. This study being a revisit to the concept of national security after a considerable period, post defining it in a previous research (author, 2002), intends to extend the terrain specificity to the human microbiomic dimension after serious and thoughtful examination. The appearance of this terrain, however, in national security studies is a distant activity, as the descriptive use of the concept for national governance will remain a selective and partisan activity for a very long time. Microbiome applies to all living things. The human microbiome, inside and outside the human body, is introduced for the first time as a terrain in national security study. As the fog on it is clearing slowly, the author believes it is time to look at it or rather through it urgently.

In the original sense, a biome is a macro-concept. It means the flora and fauna occurring naturally in a major habitat. The plants (flora) and animals (fauna) in the

biosciences may come under one terrain—the bioterrain—into which genome will assimilate, taking along with it the element of genomic security with others related to health—health security, food security, environmental security, etc.

⁸⁵Wells, S. (2002). *The journey of man*. Penguin Books Ltd, p. 54. Wells explains the reasons with a clear understanding in his book. In this book, the author prefers to keep the intrigue going.

natural habitat will have common characteristics. The flora and fauna will have their respective biomes—deserts, forests, tundra, grasslands, swamps, ocean and so on. Each biome will comprise specific ecosystems. Here it is important to understand the difference between a biome and an ecosystem. A biome is an area of the species living there, whereas the ecosystem is the interactive aspects of the living and non-living things there. A biome within this meaning is a part of the geophysical terrain.

Humans live in biomes over the land with their natural characteristics as explained. Similar to other living things, they too adapt to their respective biomes.

But the whole concept changes when the biomic space as a terrain for this study shifts to the body of a living thing. It becomes micro compared to the natural biome of the physical world just explained. To understand the difference, the term microbiome is used. The microbiome can be further elaborated with respect to the specific living thing—the ecosystem as in human microbiome.

On the other hand, the human microbiome is the aggregate of all the genetic materials of microorganisms living inside and outside a human body. This biota comprises viruses, bacteria, protozoa, fungi and others for which the human body is the ecosystem. The genes of the microbes in a person's microbiome are roughly estimated to be 200 times the number of genes in the person's genome. That is something which even a national security practitioner cannot afford to overlook. The microbiota has made themselves comfortable by adapting perfectly with the human body in case of human microbiome. They live on or within the human tissues and body fluids in their respective anatomical sites—skin, mouth, vagina, intestines and so on.

Microbiome is a vital thing for life forms along with other elements that are terrain specific—land, air (oxygen for humans) and water as per design. Microbiome is taken as a separate terrain because of its differentiability from other terrains and at the same time being vital to life. The microbiome should not be mixed with genome which is not separate from human body. Biome is external to human body, whereas genome is integral with it as far as the studies show. Integration of microbiome with genome as a combined terrain may not be a desired idea in the study of national security because of differing terrain characteristics. The time will show. Human cells are much less compared to human microbiome in terrain vastness dimension. According to studies (2014), there are about ten times as many microbial cells in the human body as there are human cells.

Still here are strong connections between human microbiome and human genome. The relationship between human microbiome and human genome is an important topic of research. Researchers have been exploring the involvement of human microbiome in health matters. The impact of human genetic factor on microbiome constitution is found intriguing by the researchers. The use of

genome-wide association studies (GWAS) to identify specific genetic variants associated with microbiota phenotypes has proven challenging.⁸⁶

5.6 Terrain Hierarchy and Future

The chronological hierarchy of the eight identified terrains in this study is important to appreciate the dimensional shift in human system perception and governance in the course of time since the bipeds in human figure danced around proprioceptively under natural gravity confused but in frenzy of survival. That is the game of singularity in differentiality. Well, they are still the same today; that is another matter. One can disagree with this statement and say humans today are far more comfortable than the aboriginality primitive and laterally static Flintstones. Just like intellectual inventions moved humans from fire to (the frying pan of) modern technology on a continuous but stepped up track changing their bioception,⁸⁷ the terrain specificity too followed the same track to enhance the domain of governance from land to (human) microbiome.⁸⁸ The terrain hierarchy is the way the terrains have been identified with respect to their evolution. The interesting findings are as follows:

- (a) Terrains evolved along with human development.
- (b) They evolved into positive consideration one at a time in a sequence.
- (c) The time gap between activation of each terrain was considerably long.
- (d) The gap between the evolutions of terrains has been narrowing.
- (e) No terrain has become unimportant in the process of development.
- (f) The importance of identified terrains is increasing.
- (g) Geophysical terrains already existed; only their development took time.
- (h) Non-geophysical terrains are evolving along with developments therein.
- (i) Terrains evolved one at a time in their own pace.
- (j) More terrains are expected to follow in a limited way.

The terrain hierarchy is seen from the period of time the particular terrain assumed prominence. The land being the place where the humans live is the basic terrain, and everything that happens elsewhere in other terrains is land-centred. The

⁸⁶Goodrich, J. K., Davenport, E.R., Clark, A.G., & Ley, R. E. (2017). The relationship between the human genome and microbiome comes into view. *Annual review of genetics*, 51, 413–433. <https://doi.org/10.1146/annurev-genet-110711-155532>. <https://www.ncbi.nlm.nih.gov/pmc/articles/PMC5744868/03> September 2020. Accessed 19 December 2020.

⁸⁷The quality changers in life patterns using the bio survival tool of humans—the intellect. Bioception is the term used here for the sensory perception of intellect and its pressure to invest in humans.

⁸⁸The terrain recommendation at the moment is restricted to human biome, whereas the original recommendation is to expand the terrain to the microbiome of all living things.

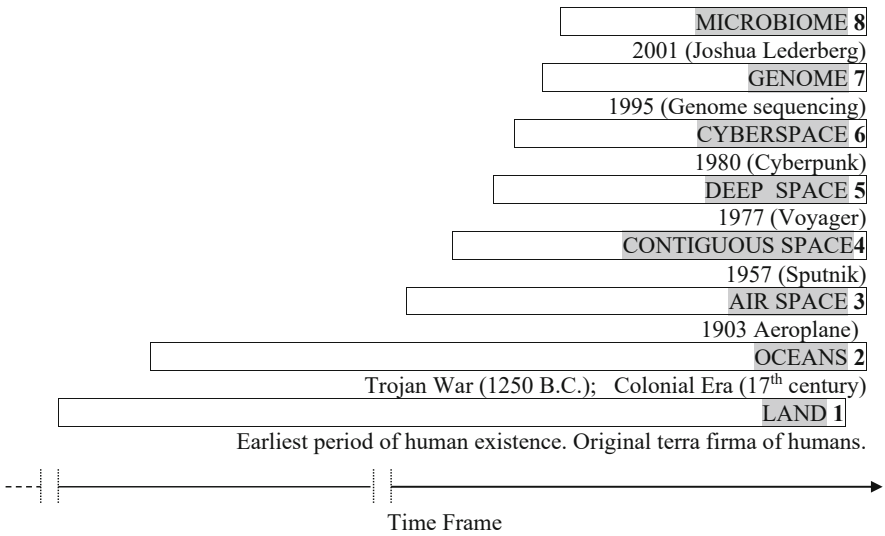

Fig. 5.1 Evolution of terrains

oceans come close to the land terrain in the history of warfare. Importance of oceans in war was recognised as early as major land warfare.

Importance of the oceans graduated further when the pirates and buccaneers clashed for the right of way and colonialism picked up momentum. The concept of air power brought the air space into prominence, and thereafter it was the strategic defence initiative (SDI) that almost made the space filled with satellites, laser pointers and missile stations.

The terrain hierarchy in the line of evolution, as examined, is given in Fig. 5.1. The mental space is not included as a terrain in this evaluation.

The hierarchy of terrains, therefore, is with a base on land and upgraded periodically to a new level with new terrains added to it. The hierarchy is based on the period of introduction of the terrain and not its relative importance. Figure 5.2 gives a hypothetical picture of the hierarchical concept based on the evolution of terrains on an inverted time frame, with the earliest period at the base.

Land will remain the universal terrain for the humans under the land-clasp syndrome. They belong to it. In the hierarchy of terrains, the chosen base of the pyramid is the land terrain on which other terrains are built for this reason. All these terrains encompass national security as integral unit with overflowing elemental activities, though some of the elements may not exist in a particular terrain. The fresher the terrain, the lesser may be the number of elements involved in it directly. This situation will change as and when time passes and the national security concept evolves further.

The microbiome is a future terrain. The issue that needs to be clarified at the moment is whether it is better to see it as a separate terrain or as part of the genomic terrain. The arguments can vary as biome and genes have certain business together.

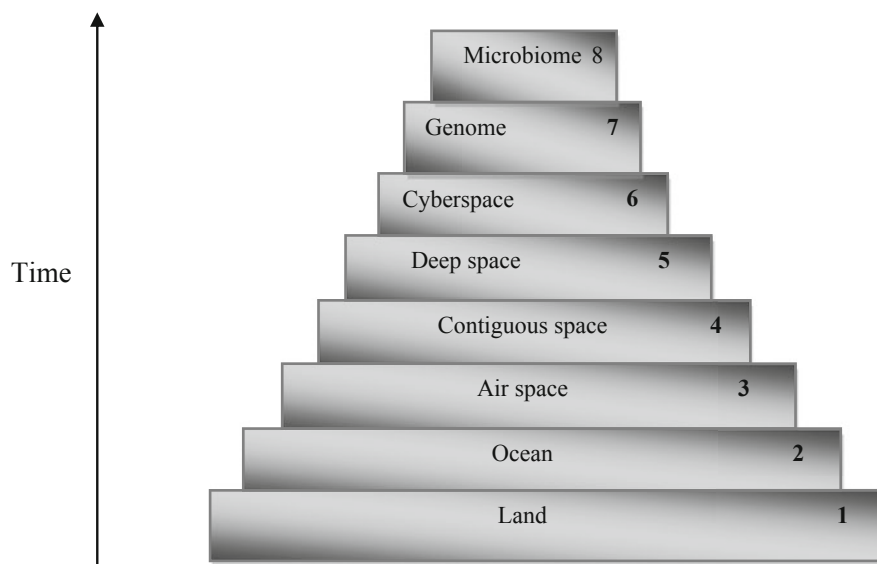

Fig. 5.2 Hypothetical hierarchy—terrain concept

The author prefers to view it as a matter of governance. It means in the executive sense microbiome is different from genomic terrain by system boundary but needs to be integrated as in the case of all other terrains for national security. That makes it the eighth dimension as a terrain in human advancement. Predicting its entry into active governance and government policies and regular practice at this stage will be possible under separate research investigation.

5.7 Terrain Specificity and Application

All these terrains are “macrodomains” of intrigue in one way or another. Humans are yet to understand even their prime terrain, the oldest—the land. Within this calibrated maze of terrain specificity, humans continue to churn and govern national security to maximise the benefits. The terrains are calibrated together as parts of the global turf in which governments play national security. The calibration is based on the human system segregation within geopolitical entities. Majority of them are calibrated as nations in the political sense. Some among them own the rest of the entities with or without murmurs of dispute.

Within this unitary arena of global human existence the concept of terrain specificity needs to be examined by aligning with the contemporary beliefs in the sphere of influence and application for decision-making and operational execution of national security. What is identified as a terrain is a consistent entity that has the characteristics of continuity and interconnectivity though undulated. These domains

are of specific nature on which the operations sustain. These are land, oceans, air space and outer space, emerging entities such as cyberspace and genome and the futuristic microbiome. Any programme for upgrading national security standards will have to go through all these terrains jointly or independently.

Each terrain is distinctive with its multi-characteristic influence on human affairs. They are exclusive from terrain specificity but inclusive within the concept of national security and governance. This distinctive character is the highlight in a study related to terrain specificity and its application. The concept of “terrain specificity” is with respect to a specific problem that may need a solution. The terrain is the domain in which the activities will unfold. Sometimes the terrain will be more than one. Terrain specificity is imperative for strategic assessment as well as planning manoeuvres. Developing a strategy without understanding the area of operation can cause difficulty in its appreciation. The area of operation can be understood well in a terrain specific format.

It is imperative that strategists understand terrain specificity from the global outlook. “One globe, eight terrains” is the format. The purpose is for governance for well-being of people. Governance is nation specific though national security ideology is central to humanity. It is global. The sum total of national security of the global entities will be the global well-being. This cannot be seen in isolation, though nations are free to calibrate and validate their respective national security game plan and accrued result. The terrains specificity of nation, therefore, has to be seen as part of the global terrain specify.

5.8 Terrain Maxima and Terrain Advantage

Out of the eight terrains, land belongs to the home turf of the humans. In the language of grounds in competitive games, land is the home ground where the players are comfortable from the Neanderthal combatants to Napoleon et al. It is the terrain where humans can move around on their legs a la wheels for relatively easy locomotion for a kill or getting things done. They can’t easily do it in other terrains. Therefore they have to integrate the terrains by maximising their properties, the terrain property, for GBNS towards their well-being. The maximisation process in this study is termed as terrain maxima. It means maximisation of terrain property. This means the governments should identify the terrain properties of the respective terrains for maximisation. The results should be included in the strategic appreciation as ocean maxima, air maxima, space maxima (for both contiguous and deep space), cyber maxima, genome maxima and microbiome maxima in governance. Land as mentioned is the home ground and terrain maxima. In the case of ocean maxima, it will be maximisation of ocean property that includes ocean advantage, ocean resources, ocean environment and oceanic islands of a nation relative to the ocean. Other terrain properties need to be identified, and the common terrain property in all the eight terrains strategically will be the respective terrain advantage.

Terrain advantage is a term used to define the strategic aspects of a particular terrain, whether geophysical or non-geophysical, to a particular nation. The term terrain advantage is one of the terrain properties. According to this study, terrain advantage is viewing a terrain from its positive and negative aspects as a whole for a particular task associated with the national security of a particular nation under a particular government as decided by the government. A positive advantage is supportive to the nation whereas a negative advantage is non-supportive. They are variable expressions relative to national security perception. An interesting aspect in the study of terrains is that a negative aspect of a terrain could lead to positive advantage in the overall terrain specific application. For example, a snow-clad mountain where an operation is difficult will also be difficult for infiltrators to create a breach in border security. A heavy weather condition at sea may prevent a piratical attack or landing by sea difficult for transnational criminals. A cyber block may keep deadly hackers away. In such case the snow, heavy weather or cyber block could turn out to be an advantage and not a disadvantage under the principle of terrain advantage from a relative angle. The terrains mentioned are applicable to all human systems, not a selective group alone. For example, a landlocked nation could contribute seriously from maritime activity and benefit from it by investing people in sea going jobs, running shipping lines and developing expertise in maritime-related activities jointly with coastal states. A nation can join a space advanced nation in space-based activities geostrategically or commercially. There is enough room for all in every terrain that is so far identified to maximise national security in the interest of their people.

5.9 Summation

Terrain is the domain where tough strategists play. It has to be identified before the game begins. In national security studies, there are geophysical and non-geophysical terrains. Land is the original terrain and the basis of all other terrains since humans are based on it. They need appropriate platforms or interfaces in other terrains. The concept of terrain is important in the study and applications of national security.

As a physical terrain, the entire universe spanning 156 billion light years in diameter is at the disposal of the tiny bipeds of the planet Earth, theoretically.⁸⁹ The super macro level does not end there. Scientists say there are 11 universes. The seers of the Hindus had said years back that there are 14. Nobody is sure. But at least this study uses the term multiverse to depict all in all. At least it is to the credit of the tiny biped with a brain that can see through time to some extent, especially considering humans stand on the first rung of the new evolution. But at the less reduced level, down to Earth and firm on the ground, there are terrains where the

⁸⁹ Full Measure of the Universe, *Hindustan Times*, New Delhi, 26 May 2004, p. 19. As known now from the primordial radiation imprinted on the cosmos that is 13.7 billion years old.

games of governance are played. Terrain advantage plays a key factor in governance for resolving problems, provided it is appreciated correctly. This facet is applicable to every perceivable terrain, whether geophysical or non-geophysical (Box 5.4).

Box 5.4 Reiterating Physical and Non-physical

“Physical” by definition has to do with the body movements using kinetic energy. Non-physical are basically other human characteristics such as human emotions, personality traits and so on. This characterisation is relative to humans. The genome of an organism or the nature of a microbiome is a dynamic physical entity relative to them, but not for humans. The physical and non-physical explanations in this study are based on terrains.

Cyberspace is virtual and unbounded though it remains in matter-energy concept of physics. It allows action through it, but not physical transportation within it. In cyberspace there is no physical movement. It is a dimension in which only information can be transferred.

In national security governance, every terrain is equally important and thereby critical for a nation even if it gives a feeling that a particular terrain is not relevant for decisions in governance. It will do well for the decision-makers to explore the terrain and conclude as null in decision-making, not negative. This is a common mistake governments make.

Chapter 6

Elements of National Security: Gravity Centres

The centre of gravity of national security shifts within the configuration of its elements relative to national governance at any given time

6.1 Introduction

An element is a fundamental part within the entirety of a thing or concept discernible to human awareness. The element reflects the character of what the perceptible thing or concept “wholesomely” represents remaining inclusive of it. National security is a concept. It can be defined wholesomely. It is multi-elemental. The elements hold exclusive characteristics. They compound and format the concept of national security as an extending or rather moving goal of governance. Therefore, the concept is time functional. Accordingly, the elements undergo variations in a mutually inclusive manner in time though they remain inclusive for compounded application in governance. Variations in governance of one element can cause variations in another ultimately impacting the overall outcome. The elements are not mutually exclusive. It is to be understood.

6.2 Elements of National Security

Elements of national security are identified from chosen parameters by examining their fundamental nature and characteristics in support to their vitality. Elements form the nucleus in the structure of national security of a nation. The centre of gravity of national security lies in the elements and will shift depending on priorities of government from one to another. A hit to the centre of gravity of national security will impact all elements as they are mutually inclusive as a nucleus.

There are varied elements. The definition and references to national security mention a host of parameters that govern or influence them. They continue evolving according to the style and experimentations of national governance by various governments. The elements have certain properties and periodicity. The hierarchy of elements in this study is considered based on their appearance with identifiable characteristics. The elements develop and may even vanish as an independent entity by integration or disintegration on a larger timescale. Periodicity is a constant property of elements. Hierarchy of the elements can be determined by the period in which they were identified and endorsed for national security governance or with respect to their interactive superiority in relation to another in a matrix. The choice can vary. It means the chronological order also can change.

The art of distinguishing various elements of national security is based on their contribution towards national security singularly and jointly by interaction. The author identified 15 elements in a serious research as the fundamental constituents of national security.¹ This study identifies one more element as the concept of national security is evolving. It is yet to come up in the common agenda of governance and also in human appeal (2020). It will. Governance becomes more composite with the increasing count of terrains and elements. The properties of the elements reflect the period of origin. The elements develop over a period. They enhance the concept as and when attempts to define national security progress through the period of its evolution. More elements may be added, and some may get merged or removed by redundancy or transformation as time passes.

The elements are highly cohesive and closely binding with each other. No element can stand alone. The “binding energy” (Box 6.1) of the elements contributes to the outcome of national security through the process of governance. All the elements are equally important, being mutually inclusive, in the overall national security governance. Hierarchy of elements is for academic appreciation of their genesis. There can be priority shifts in element maximisation based on situations and needs assessment.

¹Paleri. P. (2002). “The concept of national security and a maritime model for India”. *Doctoral dissertation*, Department of defence and strategic studies, University of Madras, India. This was subsequently published in his book *National security: imperatives and challenges*. Tata McGraw-Hill Publishing Company Ltd.

Box 6.1 What is Binding Energy of the Elements of National Security?

The 16 elements of national security are closely and cohesively adhered to each other in an inclusive manner. The binding energy is the force that binds them. The aim of governance is to release this binding energy between elements rather than maximise a particular element. This can be done by optimising associated elements cleverly in governance. The acuity of a government is based on the effectiveness in releasing the cohesive binding energy of the elements. The difference between governments is hidden in their capacity in releasing the binding energy of national security elements among others.

6.2.1 *Qualifying Characteristics of Elements of National Security*

An element of national security will possess all the identified qualifying characteristics. The characteristics will be distinctive. Therefore, it is important that the proposed aspect is tested for the characteristics before considering and validating as a national security element. Wrong appreciation of an element can lead to uncertain results in governance by shifting the focus. This is a common problem in national governance in almost all the countries. In such cases governance may not be centred on the particular element of national security.

The element should exhibit all characteristics associated with the concept of national security. The characteristics, as identified in this study, of national security element are as follows:

- (1) *Definable as an element* in the exclusive context. The factor should be pragmatically definable sans any kind of abstraction or supposition.
- (2) *Directly influences human well-being* as a system entity within its own boundaries at the highest level and not as part of another superior elemental entity or a subsystem. The factor should not be a part of another factor considered as an element.
- (3) *Characteristically in equal status with other elements* in relation to national security. There is no hierarchical difference between one element and another. However they can be chronologically separated with reference to their entry and acceptance as an element.
- (4) *Cannot stand alone* as an element. No element can stand alone exclusively in national security governance. They are seen as mutually inclusive in decision-making as one impacts another. They are collectively congruent in end objectives.
- (5) *Fundamental whole of the concept* which is definable and appreciable within a system boundary. The factor should support the functions of governance as fundamental ingredient of national security.

- (6) *Independent threat attractor* which is sensitive and attractive continually to threat that may be in any one or more dimensions of the eight forms of the threat matrix cube, in varying intensity (see Chap. 4).
- (7) *Periodic in origin and appearance* in the evolution of the concept of national security as a governance model. The entry of the factor in the governance model should have a definite time period though the factor should have been in usage and mention for quite some time. Elements of national security will not come up all of a sudden. The factor matures slowly into an element of national security. Acceptance of the factor as an element decides its hierarchy.
- (8) *Continuous and uninterrupted since origin as an ongoing factor* that influence national security. An element interrupted in between will be a new element when it re-enters the governance model.
- (9) *Independent variable* with a profile so that the indicators of the element can be ranged on a minimum-maximum scale in its applicability to national security governance at any given time relative to the nation. For example, maximising military security or preventing minimisation of it may be one of the aims of governance.
- (10) *Mutually interactive and well interfaced with other elements* for effective integration in the national security matrix. There is no stand-alone element in national security. The prime requirement of governance in maximising national security governance today is integration of the terrains and elements. Therefore the mutual interactive capability and compatibility are necessary for them, especially for the elements.
- (11) *In vogue in its usage in national security* that should be known and easily comprehensible to the public, the people, not a select few. It is important that the elements will not cause any semantic dissonance. People involved should understand them clearly and definitively.
- (12) *Should impact at macro level of the society* as national security is a macro level concept. The element should be acceptable at the same level of national security.
- (13) *Specific to the terrain* thereby identifiable with one or more terrains (Chap. 5 for terrain specificity). The elements should be capable of migrating into all terrains as terrain integration is a must for national security.
- (14) *Capability to maximise national security* being governance friendly. The objective of governance is to maximise national security. The elements, therefore, should be compatible with the process of maximisation.
- (15) *Universal in character* as national security is a universal concept. Its elements should have the same appeal. Elements should not be specific or exclusive to any particular geopolitical entity. The element should be capable to absorb the exclusiveness of an entity.
- (16) *Transnational permeability*—elements are universal. Therefore, they are permeable across borders of nations. Besides, national security is not about just any particular nation. The elements are common for all nations in varying importance with respect to situations and national objectives. Therefore the element has to have the qualities to permeate across nations. It also means an

element in one nation can affect the same or other elements of national security in other nations.

- (17) *Impossible to maximise* because of their interactive nature and hence can only be optimised through national security governance. This also validates the law of limitations and makes the target (human well-being) a moving end objective that can never be reached, but only maximised.
- (18) *Compatible with mathematical modelling* as national security needs to be measured to appreciate the state of governance and also to compare between entities compatible with mathematical modelling for overall assessment of national security.
- (19) *Governable* aspect in national governance within the rules of law and governance. The element should be governable by being compatible with the procedures of naturally followed formats of governance acceptable to the constitution, people, social systems, international order, national order, normals, practices and so on.

An element is an integral part of national security tested from among all considered factors for the appreciated characteristics. The effect within an element directly impacts national security, whereas a condition or a threat impacts an element. There are many situational factors widely in use in assessing national security that can be misrepresented as the elements. Considerable efforts and money go into managing them as elements by wrong diagnostics.

6.2.2 Charting Elements of National Security

This study identifies 16 elements of national security under the definable characteristics. They are placed under a hierarchic order of convenience below and charted at Fig. 6.1.

1. Military security (Milsec) (m_{s1})
2. Economic security (Econosec) (e_{s1})
3. Resource security (Resourcesec) (r_s)
4. Border security (Bordersec) (b_s)
5. Demographic security (Demosec) (d_{s1})
6. Disaster security (Disastersec) (d_{s2})
7. Energy security (Energysec) (e_{s2})
8. Geostrategic security (Geosec) (g_{s1})
9. Informational security (Infosec) (i_s)
10. Food security (Foodsec) (f_s)
11. Health security (Healthsec) (h_s)
12. Ethnic security (Ethnicsec) (e_{s3})
13. Environmental security (Envirosec) (e_{s4})
14. Cyber security (Cybersec) (c_s)

1 Military security (Milsec) (m _{s1})	2 Economic security (Econosec) (e _{s1})	3 Resource security (Resourcesec) (r _s)	4 Border security (Bordersec) (b _s)
5 Demographic security (Demosec) (d _{s1})	6 Disaster security (Disastersec) (d _{s2})	7 Energy security (Energysec) (e _{s2})	8 Geostrategic security (Geosec) (g _{s1})
9 Informational security (Infosec) (i _s)	10 Food security (Foodsec) (f _s)	11 Health security (Healthsec) (h _s)	12 Ethnic security (Ethnicsec) (e _{s3})
23 Environmental security (Envirosec) (e _{s4})	14 Cyber security (Cybersec) (c _s)	15 Genomic security (Genomicsec) (g _{s2})	16 Microbiomic security (Microbiomicsec) (m _{s2})

Fig. 6.1 Elements of national security with short forms and symbols (Governments and national security strategists can change the symbols and short forms of the elements with reference to their approaches to governance as they are not universal.)

15. Genomic security (Genomicsec) (g_{s2})

16. Microbiomic security (Microbiomicsec) (m_{s2})

The short form and the symbol recommended are given in brackets. This hierarchy is based on their appearance in the scene of national security governance even before the concept was accepted by discussion and usage.

The hierarchical order of the elements of national security in this study is approximated primarily for academic purpose. Shifting places in the chart is not expected to make any difference in modelling governance except in their universal appreciation. Governments are free to shift them if required for classification. This sort of flexibility is needed in national governance as there is no standard format for governing a geopolitical entity. The order is established taking into consideration in the beginning the enduring human system. They are explained briefly in this chapter and amplified in exclusive chapters subsequently.

6.2.2.1 #1 Military Security (Milsec) (m_{s1})

Originally and even today, national security is perceived by majority of people and their governments as the protection of a nation from alien invaders and those who support them from within, and the associated sight and sound show in the society—the blood bath, human displacement, et al. It percolates to defending oneself and others who matter relatively. That belief, perhaps, bungee drops the concept of national security to its lowest line of perception. People perceive military related

to war. Wars never stopped in their memory caches. The world always remained at war. More than from active and declared wars, the evidence for this statement comes from the continuing research, development, production and legal and illegal distribution of military logistics. War is a behaviour aspect for human systems. Other living things don't go to war. They don't have a Genghis Khan or Clausewitz equivalent. The business of war and associated conflicts and crimes are thriving globally. According to the law of invariance, it will in the future too. The lull between the war and the other-than-war situations will be covered by conflicts of different kinds and intermediary preparations for war. Military forces will be in continuous demand during this gap also. That is the ongoing story about war and military. What if the war is over? It is natural to imagine it will be filled with equally dreadful conflicts as it is in the human nature by default. Military is required for that too.

So, military is here to stay till the end ("the end" is used as a term of convenience; hence not defined). Military security was the lonely element of national security from the beginning of the universal human system. It is, hence, the oldest element of national security. The first ever war in human history dates back to prehistoric periods. Interestingly humans even clashed with their inferior cousins in evolutionary design, the Neanderthals, according to social researchers and scientists. Military security still remains the key element because it carries with it the power to influence the fear embedded in human psyche. The element will lose its importance only if the humans understand and agree with the limitations of war and dare to handle fear with intellect instead of reflex trepidations. It is not easy since it is a conditioned behaviour carried forward in genetic signatures over the years impacting the survival psyche. This study strongly suspects death and destruction in the human alleys could be by default as a survival requirement for human life itself, not that of individual humans.

6.2.2.2 #2 Economic Security (Econosec) (e_{s1})

Economic security is a nation's economic strength, not economic power. Normally these two terms are used together, for example, a statement such as "economic strength of nations, businesses or individuals is their economic power to improve their standards of living. It increases their freedom to make decisions that benefit themselves alone and limits the ability of any outside force to reduce their freedom". But economic strength in this study is the economic stasis that gives the confidence to a nation (others not included) that it can ensure the economic well-being of its people. Economic power is derived from economic strength. Hence a country should focus on economic strength through balanced economic gains. It is imperative the country should also master the art of deriving economic power with its acquired economic strength. The economic power, thereby, is the ability the nation can acquire to control others or resist the control of others using their economic strength. This means, by effective governance, a nation with less economic strength will be able to acquire more economic power than another with a higher economic strength.

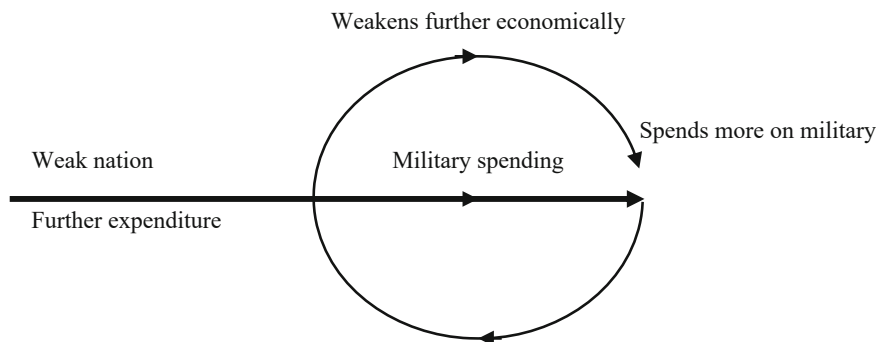

Fig. 6.2 The military security—economic security interactivity diagram—standard situation (An idealist representation meant for academic purpose only. Nations can acquire substantial military wares under geostrategic compulsions with the support of other nations and also increase their economic strength and thereby economic security. Wars can make nations economically strong. There are examples.)

Nations invaded others in the past to boost their economic strength by plundering or dominating. It is necessary to see economic security in relation to military security on one hand and to the international rating of a nation in its economic capabilities on the other. An economically weak nation² cannot protect its territories and interests militarily. In such cases, it feels feeble and threatened. The threat perception forces it to spend on military that further reduces economic standards continuing the cycle in the standard situation (Fig. 6.2). This is in case that country believes military strength is an alternative to economic strength. It is not.

In a hypothetical situation, an economically weak nation is considered to be vulnerable to external pressures and therefore embarks on upgrading its military security status (creating military and other armed forces and continuously upgrading them). In this effort, ideally its economic security should decline slowly. The economic security is downgraded by upgrading military security. The cycle continues since its feeling of being weaker makes it spend more on military. This leads to a generic hypothesis: “In the diminishing correlation between economic security and military security, there is an optimum point that could be termed as economic defence spending (EDS) which is the optimum balanced spending for military security for a particular nation, variable in time”.

The diminishing correlation becomes a law in defence spending. Economically weaker nations tend to spend more than they can afford assuming their fear factor and higher compulsions. Thereby they increase the spending rate. The point of EDS has to be identified through calculations for each nation state—the stronger nations not excluded. But those at the political polarity and aspiring to be there may have to see it with respect to their specific targets—to hold on or to nudge out.

²The other side of economic strength where economic security is minimised

The hypothesis considers that war and conflicts are acceptable realities; therefore, military security has a counter effect on economic security as expenditure. It has to be optimised by turning around by governance. Powerful nations attempt it. The optimum expenditure for maintaining military security is the point at which economic security is balanced—the point at which spending stops. It is a variable since economic standards of nations can vary. This calculation is not attempted in this book and is open for research. But military spending is not on defence alone. There are nations that spend heavily on dubious offensive objectives as a matter of policy. There are also wars that are profitable for a nation economically. Offensive activities include limited wars, pre-emptive strikes, surgical strikes, state-sponsored proxy wars, insurgency supports, etc. In such cases the economics takes a different turn, with money accounted from some other sources—secret spending, secret borrowings, money laundering, drug sales, arms smuggling and trafficking, hidden oil futures, etc. Such money is used to encourage terrorism, insurgency, sleaze deals and more that sometimes come to light in the public much to the embarrassment of governments. Economic security as a concept has not been valued much in the past; instead it was focused through various ideologies. The theories of political philosophy—liberalism, communitarianism, capitalism, communism, socialism and so on³—are all based on economics. They are not strictly on political studies. Economically weaker nations counted on military security either directly or by submitting to protectionism, which is a continuing trend.

6.2.2.3 #3 Resource Security (Resourcesec) (r_s)

Wars were fought over resources since ancient times. Perhaps the first resource on which people fought would have been fire preserved by the more affluent rag-tag communities in prehistoric times. Fire was a strategic resource that was rare. Quality life depended on fire in those days. It is easy to visualise such scenario. Scarcity of resources led to colonisation of resource-rich countries by the strong and adventurous. Strategic control of resource-rich but poorer nations has been an ongoing

³Audi, R. (ed.). (1999). *The Cambridge dictionary of philosophy*. Cambridge University Press, 1999), pp. 718-720. Political philosophy deals with the study of coercive institutions that range from family to nation state to the United Nations. It uses sometimes, force or threat of force to influence its members. This legitimacy is a question that has been often examined by political observers. Liberalism in coercive institutions is based on liberty to its members. In other words, it is a commitment to individualism. Opposite is communitarianism. Fascism is the extreme to which communitarianism can reach. Capitalism advocates capable members of the society owning the money production methods and reaping the benefits out of it. Opposite to this is communism where production methods are controlled by the community. Socialism, strictly, is a contrast to liberalism and communitarianism and takes equality as the basic ideal. These philosophies are basically the underlying principles in which coercive societies have to work. But the concept of national security goes beyond all these and provides a universal acceptance rule to people to maximise their needs towards apparent security. Economic security is an element of national security and not a hidden entity of any of the sociopolitical philosophies practiced today.

agenda for the dominant. This is also an aspect that validates the theory of invariance. Resource colonisation is prevalent even today and is expected to continue in spite of global reforms and awareness as long as conflict resources are in demand. They will be, ever. Nations will assume rival positions across the tables in more advanced communities. Water is a major cause for the Arab-Israeli conflicts. Nearly half of Israel's water installations are located in areas that were not part of it pre-1967.⁴ The scarcity of water causes rivalry between countries in the neighbourhood. One of the hidden issues in the Indo-Pak conflict over Kashmir is water. Interestingly, the word "rival" derives from Latin, meaning "one who uses a stream in common with another". According to the UN estimate, there are about 300 potential conflicts over river borders and drawing water from shared lakes and aquifers all over the world.⁵ The potential conflicts for resources are not only between nation states but also within them.

6.2.2.4 #4 Border Security (Bordersec) (b_{s1})

Borders around a geophysical terrain originate from the territorial instincts of animal kingdom as signposts that read territorial sovereignty is non-negotiable. From a dragonfly to a nation, territorial possessiveness is a primordial instinct. The boundaries are important in protecting territorial integrity. The border is the geopolitical boundary of a nation. It has to be recognised internationally for validation. Nations are actively engaged in defending their borders in every possible way to uphold their sovereignty and values. Human history is full of legends of people crossing the borders into alien territories either to invade directly or surreptitiously or in search of opportunities. It continues today. But borders, however hostile they may be or are made—mountainous, icy, oceanic, sandy or never-ending expanse of plain nothings, walled and so on—failed to deter the determined. This also shows the power of the human instinct to penetrate into the presumed to be greener pastures.

In national security studies, borders are not for geophysical terrains alone. They also apply to other terrains. These borders are the system boundaries of the associated terrains. The boundary becomes prominent and important for governance when the game is played in or on it. Governance is a game that is played always in a terrain and continuously without a gap. It means boundaries are permanent and should never be allowed to breach. But every boundary can be breached in the game of survival. This requirement endorses border security, as an element of national security.

⁴"Now World Wars over Water?" *The Times of India*, Mumbai. 21 March 2001, p. 13

⁵Romm. J.J. (1993). *Defining national security: the non-military aspects*. Council of Foreign Relations Press. p. 21

6.2.2.5 #5 Demographic Security (Demosec) (d_{s1})

Unplanned and imbalanced growth in population density impacts the overall well-being. It is interlinked with ethnic, environmental and resource security among others. But, demographic security is not concerned with population growth alone. It also deals with human migration, human breaching, human smuggling and trafficking and similar socio-economic issues. Constant flow of world population over the ground can upset the stability of nations and their economy as if on a plank over a fulcrum—the seesaw effect. Among the socio-economic issues of unplanned demographic shift, human smuggling and trafficking in various forms are considered alarmingly nefarious and heinous. It is estimated to be the third largest illegal transnational crime after drugs and arms⁶ with a stake of US\$7 billion (2001).⁷ But the author recommends the three crimes not to be viewed as a unitary transnational crime—Crimes3. They are interrelated.

6.2.2.6 #6 Disaster Security (Disastersec) (d_{s2})

It is important to understand a disaster occurs when there is loss to or of property and life. The incident is not disaster. But it is a human practice to consider the incident—flood, drought, fire, earthquake and so on—as disaster. An avalanche in a glacier is a natural incident if there is no life or property affected by it. Hence it is not a disaster element for consideration in national security governance. It may be taken up under the element of environmental security or other for governance. While in the beginning there were only natural disasters, disasters caused by natural incidents, the humans have grown sufficiently competent to induce “designer” disasters or accelerate natural disasters directly or indirectly by their cultivated escapades.

Disasters induce deep trauma and anguish among people. The agony would be reduced if disasters are prevented or damages after a disaster are mitigated. It is a daunting task. The difference between natural and human-induced disasters is marginal. No part of the world is free from disasters of some sort. The collateral damages of disasters can be equally serious and cascade into the social system. Economic growth, health, development and resource will be victims of disasters. Disasters, like environmental issues, can also cross borders. The impact may even affect geostrategic environment and change the maps of nations. The loss due to a disaster is socio-economic and generally irreversible. According to a study, two

⁶Crimes3 (author). According to the author, the three crimes regulate the world money flow and its velocity through the power generated by them. They are evolving and may include other smuggling and trafficking crimes in the future such as organ trafficking which may change the term to Crimes3+ (Crimes3 plus).

⁷Advertisement in the *Times of India*, Mumbai. 23 April 2001., p. 18

billion people were affected in the last decade by disasters globally, and 90 per cent of them were Asians.⁸

6.2.2.7 #7 Energy Security (Energysec) (e_{s2})

The element of energy security finds a prominent place in the strategic map of a nation concerned about growth and development. The importance of energy security can also be seen from the problems faced by many nations during wars and subsequent turn of events. Energy is synonymous with oil today though there are other prospective energy resources. Energy policy of a government has strong military emphasis as well. Energy consumption causes emissions of carbon dioxide that is responsible for ozone depletion and global warming greenhouse effects if the source is carbon oriented. Those who are concerned look at various sources of energy including nuclear power. Security for energy production is another concern. Environment friendly power sources will be more attractive in the future.

6.2.2.8 #8 Geostrategic Security (Geosec) (g_{s2})

Geostrategic security is about the power of persuasion, understanding and goodwill a nation enjoys in the community of nations and its people in modern times. It is also seen as a situation when it has to muscle its way through international aggrandisement to retain its position of power without breaking the rules of international law. From the earlier times, invaders and colonial empires lacked this security, and the result is seen in their state of affairs today. Geostrategic security can be misconstrued as military security. The problem in geostrategy is also that of the image: regional bully, ugly American, Red China, Taliban Afghanistan, militant Islamist, rogue states, tar babies of Africa, big brother Indian, etc. All are cases in point. Geostrategic security is depleted under these pseudonyms, and the nations will have to substitute it with other ingredients of security elements. Image building is not an easy exercise in geostrategic context. It is also not part of power projection. Carefully cultivated image helps in geostrategy. Geostrategic security, though strictly not interrelated with goodwill, cannot attribute to strengthening international relations only on power. Goodwill laced with power is the right ingredient in the knowledge-empowered and emotionally charged world. Power never flew through the barrel of a gun in relation to geostrategic security, if anybody cared for it. It also flows through goodwill. It is the combination of power diplomacy and communication in a timely and sagacious form that will ensure geostrategic security. Political

⁸Datta, D.K., Disaster Management, Proceedings of the World Conference on Disaster Management Infrastructure and Control Systems, Hyderabad, 10-12 November, 2003, p. 32

power grows out of the barrel of a gun⁹ is a statement attributed to the Chinese communist leader Mao Zedong (1893–1976)¹⁰. It is a period statement of 1938. Power never grew through the barrel of a gun or the tip of a missile. But it was perceptibly true as a period statement (1938) when human capacity was not as developed as today. Besides, Mao had a need to communicate with his people who were in dire state of coercive slavery.

6.2.2.9 #9 Informational Security (Infosec) (i_s)

Information, whether right, wrong or partially correct, holds the key in human engagement. It applies to interpersonal as well as intrapersonal interactions. The decision-making process gets swayed accordingly. Within the conundrum of information lies intelligence. Intelligence has been espoused by all strategists from the ancient time onwards. But intelligence is not information per se. It is information that calls for action. It is information about the intention of the subject in question.

Espionage and intelligence gathering were accepted norms by Sun Tzu, Kautilya and other strategists as strong points of nations. The argument whether intelligence is intention, information or both can be answered if we consider informational security as an element of national security. Information that affects national security including intentions can be seen here as intelligence. Information that affects sovereignty, integrity, elements of national security, scientific or economic interests, conduct of international relations, etc. may require to be classified. That means they need to be reserved and secured. Opposite are citizen's rights for disclosure of information. These rights may strike a discord with national security objectives, if not balanced properly. This is more so in a democratic scenario with a high-profile free media. Human rights laws may call for certain amount of liberalisation that is only natural justice. The government has to have a say in information security in a balanced manner and appropriate to national interests. These are to be cleared and clarified through enactments on freedom of information. Another issue is the growing gap between the information rich and the information poor. Information rich are the people with easy access to information. Information poor are those with less access to information. This difference can affect social inequalities and cause negative consequences, therefore a matter of importance in the overall strategy for informational security. Information equity is important. Another disturbing aspect of informational security is information trafficking—a serious matter that deals with free travel of information that can cause damage to vital interests of a nation or its people. Containment of information trafficking is as crucial as controlling other criminal traffics.

⁹ A portion of the 1938 speech was excerpted and included in Mao's Selected Works, with the title "Problems of War and Strategy".

¹⁰ Also Mao Tse Tung

6.2.2.10 #10 Food Security (Foodsec) (f_s)

Access to food for all is a requirement of healthy life. Food security as an element of national security evolves from this basic need of life. The Food and Agricultural Organization (FAO)¹¹ is emphatic about it. Poverty among population causes food insecurity. Sustainable progress in poverty eradication is critical to improve access to food under the FAO's findings. Large number of people around the world is short of nutritional food in their daily lives. Access to food is the solution that could be improved by various means. Food security, aimed at nourishment of the population, is a vital planning objective for any government. Food is not only to arrest starvation but also to provide nutrition.

6.2.2.11 #11 Health Security (Healthsec) (h_s)

There are general opinions the world over that little is being done in the approach of public health by governments. Such voices indicate the importance of public health in the well-being of people. Eliminating diseases through governance is one of the essentials of governance besides ensuring healthy living environment. All spheres of life impinge upon health. It demands inter-sectorial planning for health. According to experts in public health, the parameters include air and water quality, control of child and old age mortality rate, worsening of health and social indices of the conglomerations.¹² While efforts are taken by governments, the utility of such measures will depend upon public satisfaction.

Many nations were serious about health security from the early times. In Europe, public health arose as a special area of activity in the mid-nineteenth century. In industrialised cities health consciousness arose with the realisation that the health of one particular section of society was closely bound to that of the other and that health of each section was determined by its conditions of life. Improving the abysmal living and working conditions of the poor was undertaken, realising that these lead to rampant malnutrition and communicable diseases and also posed a threat to the health of the better-off through epidemics and social delinquency.

In independent India, the Bhole Committee Report in 1946 set up the tone for health services development. It insisted that the tiller of the soil should be at the centre of planning and health care should be available to all irrespective of their ability to pay. India had initiated mammoth projects highlighting women's health. There was movement on gender sensitisation of public health. Another area is public hygiene. In a country with high democratic density, improving hygiene is a difficult

¹¹ FAO is a specialised agency of the United Nations established in 1945. Its objectives are aimed at alleviating food insecurity in the world, a matter that was found very serious at the time of formation of the United Nations.

¹² Priya, R. (2001). "The two faces of public health". *The Times of India*, Mumbai. 12 April 2001, p. 12

task for any government. But, India's latest project for clean India, *swatch Bharat*, was a clarion call for cleaning up India and the mindset of people for whom hygiene was not a priority.

Public health also provided rationales for the Nazi acts of genocide (as eugenics) and barbaric experimentation on human subjects (as scientific knowledge helps humanity). Public health concerns seemingly motivated the extreme act of forced sterilisation during the internal emergency in India in 1975–1977 according to some findings.¹³ Public health experience has also shown that simplistic single-pronged technology-driven programmes have never fulfilled their promise.¹⁴

6.2.2.12 #12 Ethnic Security (Ethnicsec) (e_{s3})

The term ethnic, for the purpose of this study, is taken as all matters of disparity that could be identified among people and usually used to compare one with another, often in relative terms—national, communal, cultural, racism, majority-minority, religious, tribal, caste, gender, origin, age, colour, language, sex and a million so on. It is only going to increase as human density on the plane increases. According to Human Development Report (HDR), one of the seven freedoms is “Freedom from Discrimination—by gender, race, ethnicity, national origin or religion”.¹⁵ Ethnicity is shown different from other manners of human separation. According to the Genocide Convention, 1948, and in general lexicography, ethnic groups are considered separate from three other identified groups—national, racial and religious.¹⁶ This study deals with all types of human separations as ethnicity, which is the underlying basis of the element of ethnic security in national security governance. Gender, race, national origin and religion as given in HDR and all other forms of human differences that may or may not lead to discrimination are included in the term “ethnicity”.

It is from ethnicity issues that threaten the integrity of a nation or a human system originate. As an element of national security, the expression, ethnic security, covers all differences under which the humans are classified or perceived. When there is an identified difference between one and another, the ground for ethnic breeding sets in. Ethnic discriminations and associated campaigns existed throughout human life. It will continue in the future and may take different formats.

¹³ Ibid.

¹⁴ Ibid.

¹⁵ United Nations Development Programme. (2000). *Human development report 2000*. Oxford University Press. p. 1

¹⁶ Roberts, A. and Guelff, R. (eds.). (1989). *Documents on the laws of war*. Clarendon Press, p. 158. Genocide means, according to the convention, certain definite acts mentioned therein committed with intent to destroy, in whole or in part, a national, ethnical, racial or religious group. Ethnic security as an element of national security means protecting these groups and employing them gainfully for the nation under the principles of equality as per the constitution. It is much broader in its sense.

Ethnic conflicts are attributed to lack of statesmanship and governance, paucity of reasonable leadership among various ethnic sections of society and the persistence of inappropriate military bureaucracy. It is one of the built-in human characteristics arising from survival anxiety. It is a cruel predicament for the world. The end of road in an ethnic conflict is breakup of the nation state. Little attention was paid to ethnic issues and conflicts during the Cold War. The developing world was misguided and ethnic issues overtook in a stunning fashion. Ethno-nationalism, fundamentalism, militant secessionism, militarism, territorial disputes, national chauvinism, economic deprivation and gender-biased insecurity, religious polarity and conflicts within are all factors that affect ethnic security. There are millions of victims of such conflicts all over the world.¹⁷ The result of xenophobic nationalism that breaks into ethnic security is militarism and suppression. Ethnic security is maximised when marginalisation within human species is minimised.

6.2.2.13 #13 Environmental Security (Envirosec) (e_{s4})

Environment holds the key in sustainable development though there are various other factors, environmental degradation issues like deforestation, acid rain, depletion of the protective ozone layer and global warming among others. Environment is closely related to resources. Romm¹⁸ has divided environmental security in two categories: (1) transnational environmental problems that threaten a nation's security and (2) transnational environmental or resource problems that threaten a nation's security. In the first case, the issues when broadly placed can be identified as issues like global warming that can affect the quality of life for the inhabitants of a state. In the second, the issues are those that affect the territorial integrity or political stability of a nation such as disputes over scarce water problems in the Middle East or the question of what to do with refugees fleeing a degraded environment.¹⁹ This scenario deserves a relook at this moment as the world has gone much forward. There are many environmental agendas that have been initiated nationally in various countries and also globally.

Environment is transnational, much more than mere butterfly effect. It can be damaged by war and military preparations and deliberate modifications among many other human activities. The Environmental Modification Convention of 1977 forbids hostile use of environmental modification techniques having widespread, long-lasting or severe effects as the means of destruction, damage or injury to any other

¹⁷ Beauchemin, E. "Child Soldiers of Liberia". www.mw.nl, May 2001. According to reports, there are 300,000 child soldiers in 30 countries in the world (2001). A report in 2020 says there are 250,000 child soldiers in the world in 40 countries. Among them 40 per cent are girl children. Most of the girls are used as sex slaves or wives by male fighters. <https://theirworld.org/explainers/child-soldiers>. Accessed 28 November 2020

¹⁸ Romm, J.J. (1993). *Defining national security—nonmilitary aspects*. Council of Foreign Relations Press. p. 15

¹⁹ Ibid.

state party. Environmental modification means deliberate manipulation of natural processes over the composition of the planet and its subsystems—the dynamics, composition or structure of the Earth, including its biota, lithosphere, hydrosphere and atmosphere, or of the outer space. Global climate change is considered to be one of the major issues related to environmental security today. This was due to the alarm caused by the discovery of a hole over Antarctica in the ozone layer in 1985. Chlorofluorocarbons are considered to be the principal cause of ozone depletion. Secondly, the seven hottest years of the century all occurred in the 1980s (and the ten hottest have all occurred since 1973). Public awareness of climate change became particularly acute in 1988, a year of heat waves, fires, floods, drought and super hurricane. The greenhouse effect was said to be responsible for this warming trend. There are no studies relating global warming to war and military preparations so far. There are also nations and governments who disagree with the findings on global warming.

6.2.2.14 #14 Cyber Security (Cybersec) (c_s)

Cyber security play-offs are in cyberspace which is an exclusive terrain. It can be turned proactively turbulent by a few strokes on the computer keyboard directly or indirectly. It can provide and support a high-quality life or unleash panic and devastation in the cyberspace that virtually controls the information matrix most of which are vital for national security. The panic buttons can upgrade to cyberterrorism or take possession of information warfare. The cyber world has the potential to be fatal as much as it is life-giving. According to Barry Collin, today's terrorists may look primitive when compared with the cyberterrorists of tomorrow.²⁰ But, such statements have already outlived their prediction period without much damage but for the routine deviations in expected reality. Humans are alert on them. Cyber security is an evolving element of national security that needs to be studied carefully. As of now cyber security is considered a singular element in the terrain of cyberspace.

Barry Collin is not alone. There are others too who warn cyberspace can be fatal. The Central Intelligence Agency (CIA) of the United States considers computer-generated terrorism is the “ultimate precision-guided weapon”, and this capability already exists with a number of terrorist organisations.²¹ Experts say that computer-generated attacks are much easier to carry out than other terrorist attacks.

Cyber security in this study is about the terrain-specific element that when maximised supports national security along with other elements. Protecting cyberspace from digital attacks in the name of cyber security as often mentioned is only a part of the larger game.

²⁰“Nando.net and The Sacramento Bee, New Security Threats Rest in Cyber Terrorism”, infowar.com, February 1997

²¹Ibid.

6.2.2.15 #15 Genomic Security (Genomicsec) (g_{s2})

Ever since the world witnessed the secret of life unfolding in front of their eyes with the double helix, the twisted ladder, deoxyribonucleic acid (DNA), the human life could not be expected to remain the same.²² Deoxyribonucleic acid holds the instructions for making all the proteins. The turnaround in bioscience happened in 1953. Today, the world is quite advanced compared to the initial days. It is with this concern the new and latest element of genomic security is added to national security concept. It is also a fast-unfolding terrain similar to the other non-geophysical cyberspace.

The subject of genetic research is currently in the ethical mould. It deals with advancement in biological sciences related to biogenetics, informatics and genomic research. The world does not seem to be in a hurry to estimate its security aspects. But it is only a forewarning at this stage that a silent revolution like genome research also has to have its darker elements that can strangle the humankind. It has opened up all sorts of possibilities. Biotechnology is an instrument of development that can improve the quality and quantity of plants and animals quickly and effectively. In the reverse, these alterations can cause havoc among forces that balance nature. For example, killer algae created with bio-modifications can wipe out fishery sources at sea by asphyxiation. Genomically created transgenic weeds can obliterate food stock. The scientific community has reasons to worry about “super weeds” and “super viruses”. There are protests on ethical and ecological grounds. The safety, effectiveness and necessity of biologically modified food are also questioned.²³

On the human front, the issues associated with genetic research and testing can be far reaching. Genomic security, therefore, is a matter of serious study in governance as an element of national security.

6.2.2.16 #16 Microbiomic Security (Microbiomicsec) (m_{s2})

Microbiome has been identified as a terrain in this study for the first time, though the subject has gained attention of researchers and research centres for a considerable period. Its importance in governance is recent. The research is focused mainly on the human microbiomes and interventions for supporting health including treating diseases. Microbiome is closely interactive with the health and survivability of a life form—from metabolism to immune systems. An imbalance of microbiome can turn health in disarray. There is more to it; researchers have understood.

²²The British-borne Francis Crick (1917–2004) and the American James Watson discovered the DNA in its twisted ladder form as they first explained.

²³“Insight, Concept of Genetically Modified Food”. *The Navhind Times*, Goa. 24 August 2001, p. 10

The element is termed microbiomic security though it may include microbiome of other life forms also. However it is too early to say how national governments will view the subject as it is presently of research interest (2020). For example, will there be a ban on surgical child delivery in place of natural birth because the newborn tends to lose tremendous immunity in the absence of interactive vaginal human microbiome in their birth process? It is a decision applicable to governance for healthy children and subsequent adults that will impact on health security, economic security and others. Secondly the interest of government may fall on other microbiomes only when the subject picks up momentum and influence in governance.

Basically, the research in microbiome is focused of human health for the time being. They are undertaken by national research centres or institutes under government funding in countries that are in it. Those who got a handle on it have much to contribute towards microbiomic security as an element of national security. As an element, microbiomic security needs to be treated together with other elements in an interactive mode and not in a stand-alone mode for integration. The scope and range of microbiomic research needs to be enhanced for this purpose.

The interaction between microbiome and genetics is a topic that may determine the terrain specificity of both ultimately in national security studies. In that case microbiomic terrain may lap dissolve into genomic terrain or vice versa. Both together may transform the terrain specificity under a new paradigm. This will depend upon their respective dependent characteristics. But the element of microbiomic security will continue firmly.

The author's view of terrain specificity is that it is likely more appropriate to keep microbiome as an exclusive terrain as the dimension of genomic terrain and microbiomic terrain are seemingly exclusive with definite boundaries. But in this study only human microbiome is briefly examined.

Considering human microbiome security as an element of national security, it is not far distant to accept animal microbiome and plant microbiome as separate elements of national security in governance once the subject and expertise advances and can be proven as drivers of NS_{max} over the terrain of microbiome.

6.2.3 Factors Examined for Elements but Excepted

Various factors were examined for validation as elements of national security. Most of them reflect in media, debates, discussions, grapevines and various informal communications almost every day around the world, often undefined or defined imperfectly. They were tested for the identified characteristics. They were taken from those that many governments, scholars, media and other originators of information consider as priority factors of national security in situational approach. They are often misinterpreted as elements of national security and treated with special attention in governance. While the governments and organisations may find comfort in choosing them as elements of national security, this study considers them as

conditions of national security as part of one or more of the 16 identified elements of national security. Considering them as elements of national security may still get the task executed sans professional governance and associated benefits. Wrong diagnostics need not lead to wrong decisions or incorrect outcome but certainly will make the decision imperfect and, thereby, costly in the ultimate output. For example, winning at all cost can lead a human system into unforeseen end results. Even a win-win situation in game theory comes out successfully only by compromise on both sides. The aim of national security is to maximise well-being on the ground. It is a professional task for any government. Governing for national security should be professional and diagnostic, not laid back and symptomatic.

The following factors, selected at random and prioritised according to their frequency of usage as estimated, were considered in the study for elements of national security to show frequency of usage cannot be an element of national security. They are graded as “conditional” activities for consideration in governance. They do not satisfy the characteristics required for elements and hence do not qualify for it. They are further examined briefly, thereafter:

- (1) System of government
- (2) Political stability
- (3) Rule of law
- (4) Welfare doles
- (5) Violence
- (6) Weapons of mass destruction
- (7) Literacy and education
- (8) Spirituality
- (9) Militancy and terrorism
- (10) Homeland security
- (11) Internal security
- (12) Judicial security
- (13) Happiness

6.2.3.1 #1 System of Government

There are various systems of government that are accepted and taught in universities in different names—(electoral) democratic, constitutional, oligarchic, autocratic, monarchic and religious—when the people want an agent to rule them. They include military rule too. It is their choice. They are all based on the typology of government. They are the types the world can choose for the democratic form of government. The other form is anarchy under which the rule is direct without an agent and hence there are no types the people can choose from. Ultimately a nation is ruled by the people who are settled for the cooperative period. Besides the people have no choice but to

accept it under the power that creates it—traditional, physical, subjugative²⁴, coercive, electoral and so on. A formal government exists only in a human system, because humans are social species and they have to rule themselves socially to survive. Today a nation is the largest formal human system. But there will be governance in every human system. Whatever may be the system of government in a nation, there is human acceptance, subliminal or otherwise within the system. The people in any nation, where there is governance by government, will comprise those who agree, oppose, submit or are indifferent irrespective to the form and type of government. But the fact remains that all types of governments are accepted by people subliminally or otherwise. It is balanced to some extent in what the political scientists call democracy by the constitution. This has been mentioned earlier apropos to this study. In the elected form of government, the individual citizen has the right to franchise. That is the only difference. Even in the franchise democracy, there will be individuals and groups that are unsatisfied. One of the differences is that the authority is not central, vested in people, single individual or a group. It is not understood what difference it made so far from the Roman senate to the world's oldest democracy, United States. The fallacy of democracy reduces to time-based multiple authority centres.

This shows that the well-being of the people does not depend upon the system of government to categorically state that people under a particular system of government will enjoy maximum well-being. It is the style and effectiveness of governance that matters. A government in any system can follow any style of governance, but the types are normally decided except in some situations and cases. The style of governance is not exclusive to any particular system of government. In addition, the subject of national security is based on human systems, not the system of government. System of government is not the fundamental whole of the concept. Therefore the governmental system is not found relevant in national security as an element. Any type of government, well, almost, can govern to maximise national security.

The ultimate end objective, goal of governance, need not be the well-being of a nation in most of the government. But in governance by national security, the ultimate goal has to be human well-being. That is the major difference. The measure of well-being even in countries where the primary objective of governance deviates from the end objective of well-being can be a measure of its national security index. It is also possible for a government where well-being is not the primary goal to achieve a higher national security index than a country which is governed under national security concept with the primary goal of maximising well-being. The system of governance, therefore, is a situational convenience as a condition.

Security has been historically a cause of concern for all types of governments. There is no specific governmental system that can be identified as the most superior form in the national security chain that comprises the links: nation-governance-

²⁴The term subjugative is used here to describe the position of people brought under the domination of superior power of individuals or groups.

people. The UN, as a world body, consists of members from various governmental systems. Not all of them are following the so-called democratic system as widely accepted.

The statements about democracy here is not intended to downgrade democracy as accepted today as a type of government. There are signs that democracy as a type is the next stop for all other governmental systems in the far far away future. It is not known how democracy, the type, will shape up further as human system advances. It may get modified, while other types may align with it under modification on the move. But there is a need to change all types of governments so as to free them from the present infirmities leading to power abuse against the interests of the human systems and humanity as a whole. It is a long way.

6.2.3.2 #2 Political Stability

A stable government is a good idea for national security governance. It seems so. Political stability balances unrest and promotes positive decisions, it is said. Political stability supports business environment and governmental execution of policies and interventions in human well-being. There is a wider impact on economy. But a close look at systems of governments, especially the most advocated democracy, shows that such stability is an idealist philosophy. Political stability will be vacillating in any system of checks and balances in government. Constitutions are designed in a manner that they support the chosen forms of governance. They are not aimed at political stability in government as the public or authorities desire. They are supportive of governance under checks and balances. Another factor is the time limitations. Governments are meant for a time period today. Political stability in the normal sense is not time limited. It is important to understand that checks and balances in a political system should not be misconstrued as political instability. In every way, political stability is more a state of affair, thereby a condition, not an element. It helps governance, though.

6.2.3.3 #3 Rule of Law

A government is not for sleuthing. They appoint sleuths and many others to establish rule of law. That is the job of a government—to make laws and enforce them. Everything associated with petty theft to treason (anything bigger?) is part of it. Laws are part of governance; they are not governance by itself. Hence it is not an exclusive element of national security.

Fyodor Dostoevsky's (1821–1881) novel by name crime and punishment critically examines the human mind that tries to justify the unjustifiable facts about crime and punishment. If the solution for poverty is committing the crime of killing, then what does the punishment for killing should be? The background of Dostoevsky's projections in his book, according to the author's belief, would have been the reflections from his exile in Siberia for a decade before that. The mental anguish

of the protagonist of the novel is reflective of his own, perhaps. But the issue here is do crimes and punishment figure directly in national security governance as an element? It doesn't as it is part of the duties of government to establish rule of law, and that is what every government do through law making and enforcing. National security governance is about governing to provide well-being for the people in which law enforcement is only a part, that too as a chartered activity of the government.

However there are lots of talks about crimes and punishments in the world, and many organisations have mushroomed to act on human rights, death penalty cautions and so on related to crimes and punishments. The governments handle them by enactment of laws that are enforcement friendly²⁵ with respect to the nations as they believe and establish. There will be a lot of variations in the subject with respect to the policy aspects of respective governments. The issue, therefore, need not be treated as an exclusive element but an all-inclusive factor of every element in every terrain.

An interesting aspect here is to see the extreme crimes that, according to the author, rules the world what he defines as Crimes3 plus or Crimes3* (Box 6.2).

Box 6.2 Crimes3*

The author firmly believes, though hypothetical at this stage, that the most heinous and horrendous crimes against humanity in the world come in the form of smuggling and trafficking in the new world.²⁶ The public is unaware of the seriousness of it. It is hideous because it is run with the tacit approval and participation of the powerful, trans-nationally, in a professionally organised manner and violating all norms of governance, human ethics and rights with the sole purpose of power maximisation within the human system. Among the transnational organised crimes (T-NOCs)²⁷, the Crimes3 comprises smuggling and trafficking in arms, drugs and humans, the most profitable traffic commodities where traffic means transporting a commodity from one location to another across borders, where it is banned and not allowable under the law. Trafficking is different from smuggling. Smuggling is transporting a commodity from a location to another where it is acceptable by paying the duties. The difference in the case of humans is that trafficking is

(continued)

²⁵ Explained further in Chap. 8

²⁶ Paleri, P. "Transnational security issues: India". Paper presented at the Transnational Security Threats in Asia Conference, Asia Pacific Centre for Security Studies, Honolulu held 08 through 10 August 2000

²⁷ Pronounced Tee-noc in singular or Tee-nocs in plural

Box 6.2 (continued)

when people are transported illegally and deceptively under coercion, fraud or without the actual knowledge of the individuals thus moved. Majority of humans trafficked remain under the control of traffickers.²⁸ Smuggled people, transported on need and payment, normally remain free and detached from smugglers. In most cases, the human conflict scenarios in the name of terrorism, refugees, ethnic cleansing, insurgency, evolutions, abnormal violence, elections, religion, change of governments, military coups, maritime piracy, disasters, etc. are situational façades or prime opportunities for Crimes3. Even peacekeeping operations can provide opportunities for Crimes3 according to the author.

In Crimes3⁺, the author adds one more organised transnational crime—organ smuggling and trafficking. It is not clear whether to include it in Crimes3 changing the term to Crimes4. The author had reasons to believe, hypothetically at this stage, that the ongoing Covid-19 (2020) scenario has opened up opportunities to organ traffickers of all kinds around the world to harvest organs from the “unsuspecting dead” away from their quarantined and credulously distanced relatives. In all said and done, Crimes3⁺ is on at any given moment in one or more places somewhere in the world. But crimes or unlawful activities still remain under the rule of law as a task for the governments to contain them and not as an element of national security. They are conditional to the role of government in governance.

Crimes3⁺ rules the world. Present systems to contain and establish rule of law globally are insufficient (author, 2020).

6.2.3.4 #4 Welfare Doles

Dole is free subsistence payment by a government to the unemployed in the original sense. It has taken a different term in every nation that more or less attributes the payment or contribution of a government through money and materials to people without any direct return and often shown as supportive benefits. A term coined with doling is welfare state syndrome. It is a kind of positive liberalism. The government or the political party associated with it uses it to stay in power by investing public money by doling in the good will of “a few” people to remain in power. Often the rest of the population complains, never heeded, though. Doling shapes into many aspects of free money that may turn out as cash or kind and often amounts as bribery for a consideration. All these get into a muddle where the actual doling cannot be distinguished from responsible doling in governance (Box 6.3).

²⁸Paleri, P. (2010). *Maritime security: the unlawful dimension*. p. 133–162

Box 6.3 Valet and Doling

Doling in any form can inflate the valet for daily purpose. The value of money in flow reduces. Doling impacts everything related to value in a human system. That is one of the reasons why the currencies blot in time.

The concept of welfare human systems existed since early times when the rulers used to dish out money and essentials to the poor or the welfare-deserving. But the welfare state idea originated and reached comic proportions. By definition the welfare state is a type of clever governance. The state protects and promotes the economic and social well-being of the citizens, based upon the principles of equal opportunity, equitable distribution of wealth and public responsibility for citizens unable to avail themselves of the minimal provisions for a good life. But then, it doesn't happen that way. It is an idealistic theory by the argument that in reality a welfare system leads to a good life for the selected. The selected may be termed in different ways as appeals to the situation and system—minority, lower cast, below poverty line, gender based, age based and so on. It can be termed.

The original idea came from Emperor Ashoka. It was round the third century BC when he tried to adopt doling out as a matter of state policy. The ideology remained as a state policy since then though it might have led to favouritism for return to remain in power for those who dole it.

Every country is a welfare state to the extent the government doles out benefits to people. Those who argue in the case of welfare state justify it by saying it establishes social security through equity, morality, economics and other ingredients of balanced governance. Many governments take care of social security by welfare measures, subsidies, judicial support, etc. It can be concessions to certain class of people, including concessions under a constitution to weaker section of the society.²⁹ It is related to national security by ethically and socially justifiable welfare measures but remains as a policy of government that may be steered into non-equitable proportions by unjust means. Being a policy and under the power of those who govern it, politically initiated welfare measures is a conditional aspect and not common to national security as an element in its universal application.

A misgoverned welfare state (Box 6.4) is generally an example of weak governance.

Box 6.4 What is a Misguided Welfare State?

A welfare state is said to promote economic and social well-being of the citizens, based upon the principles of equity, equality and freedom. This means the populations enjoy equal opportunities, equitable distribution of

(continued)

²⁹ An example is Article 357 of the Constitution of India.

Box 6.4 (continued)

wealth and responsible governance without partisan treatment respecting human rights and freedom. This study considers that quantum well-being in all senses is more important than idealistic expectations of improbable objectives. There are various definitions and terminologies besides a load of -isms and similar explanations clarifying the expected stasis of a welfare state. But in reality there is no welfare state according to this definition. There is no equity, equality and freedom to all as desired in any nation. To that extent nations may function under the misguided welfare state principles based on “selective” equity, equality and freedom among populations. It is weak governance relative to the concept of national security. People are governed under differentiation in governance all around. The evolutionary tendency however is positive. The national security index of a country when identified (Chap. 30) can indicate how misguided that state is in welfare.

6.2.3.5 #5 Violence

Violence is human. It is not so in other life forms. Violence is a behaviour pattern by default. It can appear in human systems anywhere when triggered by anger aroused by extreme dissatisfaction or motivated politically. The reasons vary. Violence is a symptom for the inherent anger in the society or disparity and helplessness in the political system. Being a symptom it is not an element of national security. Violence is an effect supported by an identifiable cause. Violence is also a social balancer. It vents emotions.

An interesting fact that the author found in this study was that violence reduces suicide rates in the society. However it is just a finding and the correlations need to be studied before conclusion.

6.2.3.6 #6 Weapons of Mass Destruction

Weapons of mass destruction (WMD) are a word of convenience coined to depict primarily nuclear, chemical and biological weapons. There are more in the making. An example is the efforts on psychotropic weapons that can control human mind. They are causes of concern for countries that face asymmetrical threats as they kill and destroy en masse. They are linked with national security through its elements. In spite of their mass annihilative capabilities, they do not qualify to be elements of national security. They are just weapons and, therefore, have to be treated as such and controlled appropriately within the threat attractors. As threats, they have to be prevented from reaching the targets.

WMDs are heavily restricted and controlled by international laws and agreements. There are also opinions that WMDs should be destroyed worldwide.

6.2.3.7 #7 Literacy and Education

It is a condition that supports ethnic security, informational security and other elements related to knowledge base in the national security regime. Education is not just clearing illiteracy; it is a condition for creating a knowledgeable society. Literacy is the base for education. Literacy and education are conditional factors and not elements of national security.

6.2.3.8 #8 Spirituality

Perhaps there is no other word that has been rung more habitually in human mind in one form or another, since human existence, than spirituality, well, almost. Then why spirituality is not an element of national security? There are many reasons. One of them is that frequent use doesn't qualify a representative term or a concept to be an element of national security. Second, spirituality is not a business of governance. No government can give it. It is a personal perspective with a common name all over the global human system explained in the way the belief system paints whatever it means. And, there is more. Spirituality is keyed in as a word from the day when someone had the intellectual misrevelation that spirit matters to all (it is another matter that spirit also means tangible alcoholic beverage that certainly does matter to many who enjoy drinking it. Governments earn money out of spirit sales. They too love it). But no one knows spirit; everyone has heard of it. No one claims to have had a direct rap session with spirit of any kind. That is if spirits are different like humans within the frame of singularity as spirits.

Spirituality is associated with spirit that perhaps means all those concerned with the goodness and well-being of spirit, an abstract concept interrelated with equally abstract soul that is expected to reside in a human with a live body and mind. Basically it is playing with the mental terrain. Spirituality is primarily involved with religious and cultural rites, ceremonies and all those activities concerned with pleasing the spirit (lucky fellow, if it exists), the perceived animating force.

In this book, a new term, spiritual security, is introduced. It is an entirely different concept but has certain ingredients of spirituality, as perceived today, included in it. In fact, religion, god and other aspects of spirituality are part of it. Spiritual security, as already mentioned, is the wholesome filler that balances the human system in the mirage of perceived security. It includes a lot of many aspects. The appreciated idea of "spirituality" is very much in it as it is bound to human psyche in more or less clear terms in reality. It is a way of comfort, a great way that carries one beyond the mundane life and associated pains. It is more a concept than a condition, that too beyond the elements of national security that plays primarily in the apparent security frame.

Spiritual security is a security wadding humans identified in the course of their existence. It comprises all factors that contribute to such a fulfilment keeping the non-existent spirituality at bay or including it in consort as the people desire. But

spiritual security is not spirituality even in distance, whereas spiritual security is a factor for intelligent retention in human systems, since, as seen earlier, national security is a target that can only be approached to a certain level and a lot has to do with spiritual security that will fill the void to balance human life. Spirituality is another word of convenience for expressing the unknown that is known to those obdurate about it. Admittedly the term spiritual security in this study is borrowed from the word spirituality that is not agreed upon in this study as an element of national security but as one of that many parts of the perceived security beyond apparent security. Governance should take care of it inevitably as it is a human matter as long as the latter exists. That is for a very long time governed by the law of invariance along with the law of limitations. Spirituality thereby is acceptable for this study as a part that gets mixed with others in the realm of spiritual security but becomes chagrin for national security when the centres and institutions in the name of spirituality become façades for power maximisation through unlawful, unethical and immoral activities.

6.2.3.9 #9 Militancy and Terrorism

The worldview on militancy and terrorism varies. “One man’s terrorist is another man’s freedom fighter” was the definition of convenience for a very long time. Many groups engage in terrorist activities, and many nations support and nurture them by providing sanctuaries and other means. They are used in ideological violence and territorial conquests. The United States got it where it really hurts, that too in front of the world that it dominates, in broad daylight on 11 September 2001. The shock and dismay made it declare the terror attack an act of war against its sovereignty. It was an irony that it took the country so long to admit the fact that terrorism was actually an act of (undeclared) war. Terrorism brings unending misery to the people and, therefore, is a threat to global peace and security. It is an attack on human lives stealthily and violently. It is a cost-effective attack by the enemy and, therefore, a tactical form of asymmetrical warfare. Terrorism gives the enemy the necessary tactical advantage and capability to override the asymmetry. It is tactics fine-tuned to the attacker’s convenience. The solution here is to identify the enemy and hit at its centre of gravity. Terrorism is linked with military, economic, demographic and ethnic security elements of national security. One of the ways of handling terrorism is by military might by bringing it under the laws of war.³⁰ Worst, it has been there from time immemorial; hence, according to the simple biomodel, it will be there forever assimilated with the human system. What next? A lot! At least, for now, terrorism is a threat, not an element.

Notwithstanding the fact of its continuity in the future, it is important to understand that terrorism never wins. It becomes a form of short-lived violence in the

³⁰Paleri, P. “The United Nations: Decision Making under Constraints in an Uncertain World”, Advanced Study Essay (Unpublished), National Defence University, Washington, DC. 1994

model. Terrorism is akin to a tactical hit and run that satisfies the hitter more than impacts on the system. Obviously, in the psychological sense, terrorism is a weapon of the weak and hurried. It will remain as long as the weedy too rules the world.

6.2.3.10 #10 Homeland Security

Homeland security is an American expression originated post the terrorist attacks on 11 September 2001 in the United States. The Department of Homeland Security that takes care of homeland security matters is a cabinet department of the US federal government with responsibilities in public security. In other countries the public security functions come generally under the interior or home ministries. Homeland security thus becomes the expression of internal security in such countries. Homeland or internal security is not an element but a constitutional function of the government. To that extent it is a term of convenience that expresses a conditional requirement.

It will be interesting here to see how people exercise their land-clasp syndrome in their national lives. Earth is important for humans and so the land of birth, the home to their ancestors. Humans personify Earth as masculine or feminine, sometimes in the divine form. In the process of such personification, one's land becomes motherland if considered feminine and fatherland if masculine. There is no difference geostrategically but will be apparent in the habituated cultural sentiment. This also interacts with their inherent self in the feeling of nationality and lifestyle. Origin and use of such words would have had association with some important incidents when the feelings of home, one's abode for life, are consciously awakened.

Homeland is yet another term that originated in the late 1600s.³¹ According to some it has Biblical connotations.³² But as now, homeland is a term that is not gender specific but conceived for domestic as opposed to foreign. It is a neutral term outside political context. The phrase homeland security dates back to 1300.³³ It reflects a much smaller term compared to national security as an embedded part of it. This term is specific to America which is inclusive home for people from various fatherlands and motherlands. The term suits them well.

The concept of homeland security, uniquely American, is a style of governance especially by the rule of law. It is not an element for the purpose of overall national security governance. According to this study on national security, homeland security concept is already invoked in the rule of law as part of governance and hence national security.

³¹“When to Use Motherland vs. Fatherland” <https://www.dictionary.com/e/motherland-vs-fatherland/>. Accessed 24 January 2020

³²Hebrews 11:13-16

³³Ibid. motherland vs. fatherland

6.2.3.11 #11 Internal Security

Internal security is a term used in many countries on law and order situation within a country. Providing rule of law within the borders of a country is strictly an internal matter of governments. It is a matter of upholding the domestic laws and the judicial system. It is a condition for the government, the agent of the people, to ensure rule of law. The definition of internal security will fluctuate according to the perceptions of the government.

6.2.3.12 #12 Judicial Security

Absence of quick legal recourse for the common people is a concern of most of the nations. This is about the countries where the rule of law prevails. It is an administrative problem. The common person wants speedy justice. The shock and trauma only increase when the procedures are long and cumbersome. The people may stop believing in the system when stumbled upon delayed procedures. In India, the Supreme Court had commented on the delay in meting out judgments and stated as a stark reality that the judges forget that there were cases pending their verdict for a long time.³⁴ Judiciary is one of the pillars of national security. It has to be ingrained in the system. It is not an element of national security per se.

Judicial security is about justice to the citizen. In some countries it means security to court people—judges, prosecutors, witnesses and others associated with the judicial system. Here again it is a matter of citizen protection and very much part of law enforcement as a governmental function. It is not an exclusive element of national security.

6.2.3.13 #13 Happiness

Happiness is considered an emotionally induced feeling or state of feeling which is strictly individualised. National security is related to group feeling of well-being under apparent and perceived security (Chap. 2). It is, therefore, a condition in national security, not an element.

³⁴“Judges are Only Second to God, Belief Must be Strengthened, Avers Supreme Court”. *The Free Press Journal*, Kolkatta. 8 August 2001, p.3

6.3 Hierarchy and Interdependency of Elements

Formally, the elements of national security do not follow a hierarchical system. At best they can be identified with respect to their period of entry or appreciation by scholars on the subject. In this analysis a new element “microbiomic security” (#16) has been identified. It is yet to gain serious consideration in the governmental functions of human well-being. It will remain last in the hierarchy of appreciation.

Based on this contemplation, it is natural for military security to be counted first being a derivative of physical security, the oldest sense of security that humans envisaged. Another way to position the elements in the group is based on their interactive preferences. It is a variable since interactiveness of elements will be based on situations. No element of national security is mutually exclusive. Mutual inclusiveness and dependency are one of the characteristics of elements of national security.

Terrain specificity works differently with elements. The elements spread out to different terrains. The best way to understand is looking at the spread of military security. It is all terrain pervading. It may even enter the microbiomic dimension. Elements are also transmutable with each other in such a way that an action in one reflects on another causing a change. The reflection can be relatively negative or positive.

The hierarchy therefore could be based on one of the following criteria:

- (a) *The period of entry of the element in national security.* Once entered, the element holds its position until totally petered out of the hierarchy. In this case the hierarchy is fixed and stable besides being universal in application.
- (b) *Interactiveness of elements.* Elements are not mutually exclusive. They are closely interactive but not exactly synonymous with each other. An effect in one will have an effect in another and jointly impact national security. The degree of interactiveness could be a benchmark for defining a hierarchical order. The more an element is interactive, the higher it will be in importance in the hierarchy. In this concern also, military security stands oldest. That is the reason why the world is fixated on it when it thinks about national security—a reasonable mistake often made in national governance.

The profile of the hierarchy shifts with respect to the period it is in. It could also be nation specific, because importance of an element could vary for each nation at a given time. Other aspects of hierarchy of elements are not clear. What happens when an element becomes extinct? What happens to the interaction with other elements in such case? It can be presumed that the interactive elements start weakening when the primary element becomes weak and slowly vanishes. By that time the interactive elements may get totally detached. Looking at the current set-up, it is not likely that any of the identified elements will weaken in the near future. On the contrary, their potency may even increase. There are also chances for more elements to join the matrix. The interactiveness of elements is of special interest to analysts and strategists, and often one may overlap the other in importance as well as activity-oriented

security discussions. They have common characteristics as threat attractors and conflict inducers. The choice of a hierarchy is best left to the governments interested in governing national security. The hierarchy visualised in this book is in the fixed universal mode—according to the period of their entry into the matrix of national security. The identified hierarchical position of elements is given below.

1. **Military security** (the earliest known period)

Military security as physical security is considered the sole security issue from the very early days. Wars were fought from the time human groups interacted. The idea that one is not secure unless one “kills” the opponent still persists.

2. **Economic security** (next in hierarchy—the early days)

In the olden days, people exchanged relatively less important things for the more important under mutual consent. It was hibernated economic security. One needed something to get something. Subsequently money took the place of something to get something one wanted; everything changed.

3. **Resource security** (next in hierarchy—the early days)

Importance of resource was known to humans very early, starting with water, food and fire. It ran parallel to economic security but considered next to it. People traversed the world for resources. It is an element closely associated with military security and economic security.

4. **Border security** (1648)

The border mentioned here refers to the boundaries of the geopolitical entities accepted under law globally. The importance of border security springs from the origin of nation states subsequent to the Treaty of Westphalia in 1648—the European model. That was when defined borders started dividing nations. It is again close to military security historically.

5. **Demographic security** (next in hierarchy—post 1648)

The idea of demographic security comes from the perception of a settled nation state, hence, placed below border security in hierarchy.

6. **Disaster security** (next in hierarchy—post 1648)

Whereas disasters were experienced from the time humans began life on Earth, the views were changed since the formation of stabilised nation states and hence placed immediately below demographic security in hierarchy.

7. **Energy security** (end eighteenth century)

World was never the same since James Watt (1736–1819) released the genie of steam from the kettle. Since then humans became dependent on external energy beyond animal power. Watt’s invention of steam engine propped up the industrial world that set the change for human society from agrarian and handicraft economy to that dominated by industrial production. It began in England in the later part of the eighteenth century. Human dependence on external energy continues since then.

8. **Geostrategic security** (1919)

The victorious allies established the League of Nations (1919) after the First World War to encourage international cooperation and avoid another total war.

Though it failed, the origin of the concept of geostrategy is taken from that date. The UN followed it (1945) and there are calls for change. Boutros Boutros-Ghali who was the secretary general (1992–1996) mentioned it.³⁵ Geostrategic security flows from the concept of internationalism that is getting reinforced.

9. **Informational security** (1927)

Dating the origin of informational security is not easy. It started figuring out in strategic conversations in the days of war. The Second World War brought out the need for centralised information on military matters. The CIA was created in 1947 for gathering such information for the benefit of the president of the United States. The informational security mentioned in this book is not strictly on military security or intelligence matters but all those related to the role of information in national security. It involves information management and sharing information with people who have the right to know in certain cases. It began with the advent of newspapers but accelerated with the mass introduction of radio. The date is taken when the British Broadcasting Corporation (BBC) was established (1927) though there were records of broadcasting earlier in a smaller way. The BBC played a major role in public information broadcasting. Information for the people, as a concept, developed fast since then.

10. **Food security** (1945)

Food security is dated to the world food programme of the UN. The FAO, established by the UN in 1945, has the mandate of eliminating hunger from the world, increasing nutrition and improving agricultural productivity. Serious thought on food security originated from this regime.

11. **Health security** (1948)

The UN established the WHO in 1948 to consider matters related to improving the health of people by international cooperation. Since then, health security was recognised a serious issue of human well-being.

12. **Ethnic security** (1949)

This book places ethnic security as a serious fallout of the Second World War genocide and subsequent activities that resulted in framing the Holocaust and Genocide Convention—1948—adopted in 1949. Though it has followed the “League of Nations” specific health concerns, it is dated on the formation of the WHO since when it gained momentum.

13. **Environmental security** (1972)

Environmental security is dated to the formation of the United Nations Environment Programme (UNEP) in 1972. The UNEP guides and coordinates environmental activities within the UN system. It is subsequent to the formation of the UNEP; awareness of the world towards environment was focused as a transnational issue.

14. **Cyber security** (1990)

³⁵ Chaudhury, N.R. “India, the Next Great Power”. *Hindustan Times*. New Delhi. 13 February 2005, p. 4

The earliest known computer was the abacus (1100BC). The cyber world originated much later. Though the computers are dated to 1943, cyber security as a serious subject could be taken at the beginning of information technology boost in the last decade of the twentieth century.

15. Genomic security (2000)

Genomic security is associated with DNA, first discovered as a chemical in 1869 but identified in the role as the miracle helix of biology carrying genetic information much later. In 1953, James Watson and Francis Crick determined the structure of DNA. The subject has tremendous potential for human well-being. It is dated to the dawn of the new century as a national security element.

16. Microbiomic security (2021)

Microbiomic research has gained attention in recent times. Among them human microbiome is considered to have potential in various fields including food, health nutrition and so on. The study of human microbiome is expected to gain momentum in the coming years and subsequently in national security studies. It is somewhat early to state whether it is a full-fledged terrain of national security or part of another. However, irrespective of terrain specificity, it has all the supporting characteristics of a wholesome element of national security based on this study (2021).

All the elements of national security are interdependent. Interdependency is one of the essential characteristics of an element of national security. A change in one element induces a change in another resulting in an incremental or declining effect in the overall national security. The idea of governance is to optimise the changes in such a way the binding energy between the elements is maximised towards overniece. This is an area that needs serious research.

The interdependency of the element makes it associative of other elements. It is also for this reason that this study considers use of the term non-military security is not strategically appropriate together with military security since the latter is an element whereas the former is a conceptual difference assuming military security is a stand-alone concept. This change is recommended in this study (Box 6.5).

Box 6.5 Where Non-military Security is a Misnomer

It is important to understand at this stage that the elements of national security other than military security are not to be treated as a singular reference format expressed as non-military security in strategic appreciation of the concept. Military security is an inclusive element of national security, not a concept, along with 16 other inclusively qualified elements in the wholesome concept of national security. Military security as an element of national security cannot stand alone from other elements of national security for governance under the definition of national security in this study. Every element plays complementing roles in national security governance.

6.4 Summation

This chapter is concerned about the elements of national security. A considered analysis based on the identified characteristics articulates 16 elements. They are integral to national security. These elements are interactive with each other at varying degrees with respect to situation and demand expert governance towards maximisation of national security. The chapter also points out many conditional factors that are often mistaken for elements of national security. They were explained briefly in their present usage only to show that they are conditional and do not qualify to incorporate in the table of elements in their present format. They could be symptoms, threats, conditions, procedures or modes of governance that are viewed by the public and government equally as elements. More such factors may originate in the future. They are all closely related to national security governance, and their conditional contributions will depend upon the style of governance. Though the elements may not form part of any hierarchical order, it is comfortable to place them in the order of the period of their entry into the realm of national security governance. In spite of the presumed hierarchy, each element is equally important in modelling national security. In national security governance, every element is equally important and thereby critical for every nation even if it gives a feeling that a particular element is not relevant for a decision in governance.

Chapter 7

Convolution of Apparent Security and Perceived Security in Governance

Why blame government? One cannot get what is perceived as want. But apparently may get what one needs under maximum governance laced with wants

7.1 Introduction

It is not an assumption but a generic truth that every human can “govern” formal human systems. This is considering governance is a survival need for a human system. The biomodel in this case is the ease at which a newborn draws milk from its mother’s nipples, even before opening its eyes, for the first time. It is not a survival option as a want. The ability to govern is the singularity. The way one governs, the “how to” of governance, is differentiability. The criticism by the people in relatively negative and positive formats on governance is a sign of singularity. Unsuccessful or failed governance will carry the activities under differentiability. Convolutions in governance therefore come from the inherent singularity along with differentiability,

because both exist together in human system. The game has been going on; it will continue.

Governance follows human principles and parameters as social beings. Humans need social groups to survive and therefore they need the ability to sustain them. Loneliness can kill; some say.¹ Social living makes it natural for humans to lead. It also makes following the leader a quality of leadership. Aristotle was said to have espoused these findings which his student Alexander understandably quoted often. Who else but a student can carry the flame of the teacher?

This makes governance systemic to human approach in group behaviour. Sapiens, the present-day humans as this study would like to declare and call for, exhibit systemic sensibility in governance. It gets diluted in most of them or rather pushed behind in active thinking by culturally acquired conditioned behaviour. Interestingly, people miss these faculties when they cannot bring forth the sensibilities of birth at critical times by sheer non-use in the absence of unrelenting requirement. They blunt it by lack of demand in routine life. The systemic sensibility to govern is one of them. Simply put, governance is the way a formal group is kept sustained in all respects. It can be done by anybody according to these statements but are practiced only by some within each organisation or formal human system. They are there in a situational commitment. They need to learn it by honing the systemic sensibility for governance because every formal human system demands governance.

This study looks at the governance of a nation. Governance is what a government does or expected to do. Government is supposed to pilot and steer the dynamic human system towards its well-being, like a ship on passage to its destination. It was said to be Plato who metaphorically attested the term governance from nautical lexis. If governance is sliced from the nautical lexicon for navigation and pilotage, it has an original probity and speaks about everything that the captain of a ship is supposed to do vis-à-vis the ship as well as the people on board.² It is no easy task and so is governance. In nautical parlance, the accountability of a captain is first to the ship and then to the people on board as crew and others. Similarly, can it be said that the accountability of a government is first to the country and then to the people of the country, its citizens anywhere and non-citizen residents? This study endorses such view. Whichever, it is important to drive home the idea that a country (the geo entity) is different from its people by identity at this point itself. They are two different

¹ There is no evidence in this statement. It is however used as a generic statement that supports joint living.

² In considering the nation metaphorically as a ship, Plato's original nautical comparison of a state with a ship, "ship of State" (Book VI of the *Republic*, dated around 375 B.C.), in the Socratic dialogue appeals well in defining governance in this study. The metaphor was followed and quoted by many scholars and thinkers subsequently to mention about nation and governance. Comparing a ship and its crew with a nation state and its people is what this study also considers an appealing way to explain about the present-day state or nation, its government and people, idea of governance and objectives of governance.

hierarchically disparate target entities in national security governance. It is nation first and people next without more ado.

This study focuses on the governance of a nation; the largest formally established and accepted human system since the seventeenth century. Governance is at the centrum. It has to be examined seriously before deciphering the peccadilloes and confines in performing it.

Chapter 3 mentions that national governance is about apparent security. Perceived security is not directly governable. Apparent security is considered the needs of the people or the members of the human system that are being governed. However, the statement deserves a more delicate examination. Adler's exposition of apparent security as what the people need and perceived security as what they want creates a kind of ambiguity in governing the aspirations of the people in a formal human system such as a nation. Never has been there any government who could succeed in it completely (Box 7.1). The result is convolutions in governance.

Box 7.1 Freedom, Says Vedanta; Freedom, Says Anteforces

According to Vedanta³, the ancient Hindu scriptures which in literary sense means end of Vedas or the conclusion of the whole, the essential nature of human being is “absolute freedom” which ultimately is liberation by knowledge. If that is so, then electoral democracy is perhaps the type of governance that provides a fleeting feel of freedom to people where freedom is associated with living sans shackles of any kind: physical, mental or emotional. But does this happen? The electoral democracy considered to be the highest type of governance (debatable) where people have the freedom to express still stops in the divide between the elected and rejected in which the elected focuses more on those who elected them as the ruling elite against those who were pushed into interestingly called the “opposition” meant to maintain checks and balances. It doesn't happen; the opposition opposes everything mostly generating anteforces. The freedom, therefore, gets questioned and turns to an impossible dream selectively with respect to the people and the situation. This convolutes governance. In every nation the quantum of freedom is selective with reference to governance. This stasis is amplified in the slogan “freedom” chanted

(continued)

³Vedanta reflects ideas that emerged from, or were aligned with, the speculations and philosophies contained in the Upanishads specifically knowledge and liberation. Vedanta contains many sub-traditions on basis of a common textual connection called the *Prasthanatrayi*: the *Upanishads*, the *Brahma Sutras* and the *Bhagavad Gita*. *Prasthanatrayi* is explained differently in yoga sciences. It is not relevant here.

Box 7.1 (continued)

rhythmically by certain anteforces in gatherings in India, one of the highly responsible nations in the world as the so-called largest electoral democracy. The anteforces seek “azadi” which originally in Persian means “freedom”.⁴ This is a paradox in modern governance where freedom and liberty is the ultimate unless considered “azadi” chanting is the proof for the level of freedom that exists. One will find it difficult to shout and call for freedom in a system unless there is freedom to ask for it. The convolution here is that there is no form of governance so far that would provide absolute, equitable and equal freedom to everybody at all times in a human system. It also means governance can provide well-being only in a limited manner however advanced it may be under the clash of human vacillations in the binary polarities of the global human system. Does this mean a global approach to human well-being is impossible? The author doesn’t believe so. But it will be limited under the rhythm (natural frequency) of human system evolution that will determine the convolution of apparent security and perceived security.

Historians may call certain periods as golden ages in the reigns of many governments of yore. It is not clear whether the people of the era ever felt them that way. Such statements are heavily opinionated and even where it had been glittering could not be linked with the well-being of people. One can see such models in the present-day world also where poverty and inequality are conspicuously hidden far from the symbols of power, abundance and affluence that dot the skylines all around. It is also a sign of the law of invariance. If the poor is essential for the existence of the rich or vice versa, then the so-called golden periods of history is a strict no-go in reality. In other words no governance can pay the toll for a perfect drive through the turn pike. It means, can it be said, “No governance is good governance?”

At least it can be concluded that no government can fulfil even the needs of the people, least the wants. It will be difficult for a government even to meet the apparent security requirement of a people. Perceived security will be a distant dream. The net result is a huge deficit in national security as defined. The deficit will create gradients among nations for the power and influence to flow. If apparent security is the minimum that a government should provide, then it is also natural the people will hunt for perceived security on their own. In this effort they will fall prey to the influence of the binary poles of human system—political and religious (Chap. 2). This translates the state of global security as a sum of the states of national security at any given time.

This hypothesis can be examined by those interested. This chapter looks the “whys” and “whats” of it. The fact that governments cannot govern beyond certain limit of apparent security not only validates laws of limitation but also brings forth

⁴The word which also means “liberty” is used in other languages, including Luri, Pashto, Kurdish, Hindko, Baluchi, Armenian, Azeri, Hindi, Urdu, Punjabi, Bengali and Kashmiri.

the truth of governance that it is not the type of governance system that matters but the style and efficacy of governance.

The best a government can do is to triangulate the needs and wants with what the people can actually hope for under a multitude of ever-changing parameters. Some of the parameters will be short living with restricted half-life. They will call for further look up in the needs and wants for adjustments. The sapiens world today is far more advanced and almost decent, yes, almost. Governance of a nation state is taken seriously. Well-being of people is a serious matter today. But, then, what is well-being? Before that, one may look at Adler's manifestations on the subject of human exactitude and vagueness (the opposites) and compare with modern governance. This chapter intends to do that, slowly.

The theory of apparent security (needs), when pitted against perceived security (wants), makes one a fidgety imp at any age insatiably urging for more. "I want more than what I need", the child in one woes. The sapiens needs something for survival and wants everything for living. Sartre's existentialism takes a histrionic beating here. "Who wants to exist; I want to live" is the actual musical and hoo-ha around the present-day Westside story of life.

The theories are based on the findings of Alfred Adler. At that time Adler was streaming one of the tracks of psychology, the study of how people behave, into social context. It happened in the beginning of the twentieth century. There were many crucial and contemporary issues involved in Adlerian studies. Adler recognised human beings as part of an indivisible whole, a system which again was part of many other small and large systems. The smallest in this process was the family (a formal social group like the Flintstones⁵ to start with). Stretch upwards, the family passes through many "larger-than-the-family-but-smaller-than-the-nation" formal human systems before it reaches there—the nation. Adler rightly pointed out that our way of responding to the smallest social system, the family constellation, may become the prototype of our world view and attitude towards life. That means what people are in a family is what they are in a nation. The nation reflects the family. The term "global" appreciated by Adler is actually the nation in the present context as there are many departures in a global scenario.

This aspect has been widely discussed since then by experts in psychology and human behaviour with substantial insights from anthropologic studies. The theories that came up with every study point out of the Adlerian principles and were frameworks for appreciation of problems in human system governance. A micro-family reflects in a modern nation and its governance. The geostrategy between nations can be modelled similar to family relations by raising the scale in a biomodel.

⁵The Flintstones was an American animated sitcom created by William Hanna and Joseph Barbera of the 1960s (30 September 1960–1 April 1966).

7.2 Governing Human Systems

Notwithstanding the historical mentions on governance and the expositions of Adler on security, the subject matter of governance needs to be examined in the modern light. The author's take on governance is based on what a government has to do to meet up with the demand of the day. In general, governance means managing a human system without limiting to its boundaries.⁶ Due concern is given to the system(s) to which it is interactive. It applies to any formal human system. Governance is the overall process of "governing" a family, organisation, nation, global systems and any other formal⁷ human groups in between with a purpose which in the case of a nation is the well-being of the people by maximising national security in the global perspective. The national security-centred approach is applicable to national governance. The governance in any such case is done by a designated authority which is accountable to the members of the organisation for their well-being under considered responsibility. For a nation, it is the government empowered by the constitution.

The sapiens world of the day comprises many human systems. Old systems move out; new systems come. Accordingly the systems and terms need to be defined and redefined for better clarity. The systems comprise humans who thrive on satisfying the needs and wants. They are both physiological and psychological (not exactly in the oft-mentioned body-mind geometry) with certain disciplined mutually understandable regimen between them. People are comfortable and feel well if these needs and wants are satisfied. Well, that's what ideally one expects to happen. Whether they will pester others relentlessly even if the needs and wants are satisfied is not easy to conclude, because it never happened so far in their lives. Ha, that is the catch on the way. Or rather, "complaining" seemingly is one of the human requirements as perceived need, and questioning is the reaction. This brings out a logical elucidation here: what one thinks a by-product can be a product; a resultant is perhaps the actual. One needs to go beyond the realm of logical mathematics to appreciate it, like drawing a parallelogram around a hypotenuse. It is possible. For example, if complaining is a need, can it be satisfied by satisfying the client not to complain? No. One has to allow the prospective complainant to complain. That means a need goes beyond the want. Social assurance of comfort is a need for the people. Quality of life may be seen as a physiological need with respect to something. It also needs to be shown and compared with others to be of quality for psychological satisfaction. People may "choose" a government as their agent for governance for it. They could feel charged when the government doesn't perform as they want. They get a chance to complain and agitate and accordingly feel comfortable under the pretext of discomfiture. "All is well" even in a mayhem and blood

⁶Paleri, P. (2014). *Business environment*. Cengage Learning. p.70

⁷It may be noted that governance of an informal human system is not taken into consideration in this study. The theories and principles associated with national security as appreciated in this study are not considered applicable to informal group governance.

bath. Many political parties thrive in government by providing need and want barriers or blocking governance as the finals. Look around seriously. One can catch a glimpse.

Governance is a broad word today. It is defined differently by scholars appropriate to their learned expositions. Governance applies to all forms of organisation in varying styles. Management is passé.⁸ Traditional management that was confined within the boundaries of an organisation focused on material gains (profit) has given way to sustainable management beyond boundaries. That's governance. In the context of national security studies, governing is about national governance to provide for the well-being of the people of a nation. It has been ongoing since the time of sovereign states progressively evolving. Governance is widely used in explaining the process of governing a formal human system, whatever it may be, including the global system. Here the convolutions with respect to the Adlerian principles of apparent and perceived security are examined against the national system.

Governance in this context is the duty of the government. The government has the authority through the constitution. The governments are free to choose their styles and, of course, profit or repent based on the outcome. Interestingly, the government by its “beyond boundary concept” is not confined to the boundaries of a nation. It has to get out of it into the world. This makes governance larger than management (Box 7.2)⁹.

Box 7.2 Management and Governance—Lessons from Corporate Governance

National governments can take a point or two from corporate governance. Management as it is processed since 1904 with the introduction of the subject to find better ways to face competition in business was about accomplishing the desired goals through people by optimising resources for the benefit of the organisation competitively. The focus is on the organisation, the human system, within the system boundary. Corporate governance evolved from corporate management with the inclusion of business ethics, transparency, accountability and regulatory measures for ensuring stakeholder well-being. The focus of business was no more insularly inwards. It turned beyond the boundaries into the business environment as a whole. It means governance as it is today demands responsible behaviour and conduct from those who govern towards the externality of the system. National governance, it means, cannot

Box 7.2 (continued)

be insular to the concerns of the respective nations as perceived by the government of the nation but should be considerate to the human systems of the world of nations in a geostrategically appropriate manner. Is it so? Does this justify passing a bill by the US Senate on Tibetan people's autonomy in choosing the Dalai Lama?¹⁰ It does if the meaning of governance is beyond the national boundary context in a densely populated world of the day.

7.3 National Governance

Notwithstanding the need of governance to look beyond the boundaries of the system, national governance in empirical studies is about governing a nation. It is governance at the highest level. Global governance to that extent is a term of convenience today. The concept may take a long time to evolve. The apex of governance is at the national level today. Similar to the concept of national security, the theories of governance too evolve depending upon the need for governing a human system. The ideal and standard formal organisations for governance as practised in modern times are the nation states. They are good models to study governance. Global governance is still an evolving topic of discussion. Global security is about collective security of nations as of now. The world is yet to be considered a formal organisation. There are many formal organisations in the present-day world, though. A nation is big as a formal human system even if it is small and thin as a geopolitical entity and supremely sovereign.

Governance as applied to national security is about the fulfilment of human needs within the applicable level continuously and sustainably. Can a government achieve this and if so how much are what the scholars and agencies have to see. Governance can be executed in diverse ways as one can see around. In fact every government everywhere in the world has its signature style of governance from the beginning. But none of the models were aimed at maximising national security as defined in this study. They urge towards it one way or another—a ticket to anywhere. Governance can be guided by the national security maximisation approach appreciating the convolution of apparent security and perceived security. This is a different approach from the usual. It can standardise governance to a measurable comparison. The author believes. This study is aimed at it—standardisation of national governance with or without the presence of the respective national signature of governance.

In this approach, the definition of national security benchmarks the process, the 8 terrains define the “ground” to integrate the game, and the 16 elements reflect the

¹⁰H.Res.697 – Affirming the significance of the advocacy for genuine autonomy for Tibetans in the People's Republic of China and the work His Holiness the 14th Dalai Lama has done to promote global peace, harmony, and understanding. <https://www.congress.gov/bill/116th-congress/house-resolution/697/text>. Accessed 12 January 2021

focus centres. The definition, terrains and the elements (as of now) influence governance in its evolution faster than any other conventional principles of governance. An observation of the evolution of the theories of governance will indicate the passage of the process through some of the elements such as the military, economics, resources, environment and so on. The concept of governance has now moved on from its theoretical framework to a more practical interventional application in national governance. The reflection of such a movement can be seen in the governance of other formal human systems and subsystems such as corporations.

The evolution has gone to the extent that scholars have been chasing definitions for various types of governance formats, the highest of which still remains national governance, which according to this study is national security governance. Global governance, though on a much wider scale, has to be seen against the definition and parameters of the concept of global (collective) security with applicable changes or seen against the background of national security where the prime player will be the nation subject to the respective national security parameters.

Where does the government get the authority to govern, how should they govern it, and how does the government interact with the governed? They are the major challenges of national governance. These can be established causatively analysing the authority, responsibility and accountability (AR&A) of government based on the theories of management applied to national governance. The advantage of standardisation is that in such governance, though country specific, the world can come together and understand the problems better on comparative metrics.

7.3.1 Authority, Responsibility and Accountability in National Governance

Authority, responsibility and accountability go together with the assigned duties in a formal organisational system or a situation in an organised human activity. In the basic activity environment in response to a duty, authority provides the power to make decisions and execute them by influencing the people while performing the assigned duty. Responsibility is the feel invoked as an obligation by the assignment of the duty appropriate to the authority delegated to execute it. Accountability is the answerability of the individual or group for their actions to the delegators of authority to perform the assigned duty. The three terms are intimate. Imbalance of AR&A in an activity environment impacts the entire process of activity. Balanced AR&A makes the activity goal oriented and objective; absence of AR&A makes the activity impossible; extreme authority makes the activity despotic. The outcome of the activity in a human system will depend upon the AR&A within the activity profile.

Governance is based on **authority**. A government needs authority to govern from the governed, the people and, in modern times, from analogous entities of the world. It is a kind of universal approval and a recognition of “the being” of a nation. The

being of a nation is an enduring concept in the present-day world. The general idea of a nation that reflects its people can be visualised in a different perspective—the people reflecting their nation. There is a big difference between the two statements. The latter can also lead to understanding various nations with respect to its people and vice versa. The two pointers in these statements are “the people the way their nation is” and “the nation the way its people are”. These projections also highlight the identity of the nation separate from the identity of the people. The identity of the nation and the people keeps moving between the two parameters that are also variables with time, though leisurely spanning generations. This also indicates nation is different from its people. Plato’s theory of the captain, the ship and the people comprising the crew and others on board attains validity in this statement. The ship is different from the captain, crew and others on board. A government has to see that both these aspects are fulfilled to the maximum in governance—the well-being of the nation and its people.

Under global recognition, governance obviously percolates beyond boundaries of the nation for any government extending globally as part of a collectivity. The collectivity theory is different from the social responsibility theory of smaller systems, especially the corporations. Recognition and acceptance by others in the collective are an ideal situation for nurturing the authority acquired by delegation by law and global recognition. The authority gained by a government induces **responsibility** in it. Responsibility is the sense of duty the vested authority brings about. Responsibility cannot be handed over or appropriated on to the government. It is how it feels. The degree of responsibility can vary from government to government even though the quantum of authority remains more or less identical. A nation becomes responsible when the sense of obligation it feels towards itself (being an individual entity), its people and the world is recognised by the community. The authority makes the entity accountable to the source(s) of delegation. The accountability also originates from the responsibility that the entity experiences.

The quantum of authority, responsibility and accountability in the system determines the style of governance. It is something like the pH value (hydrogen potential) in chemistry. The AR&A value comprises three factors that in “quantum balance” are expected to provide good governance. The measures vary with time in any form of governance. In the national security model, there are chances of AR&A balance among nations since the objective of governance gets almost standardised for all. The country specificity still prevails as each country is different.

National governments acquire authority to govern in different ways. The governments are classified based on the type of authorities that percolates to them through acceptable provisions and procedures. In a previous study of national security, the author mentioned 27 different types of governmental systems (Paleri, 2008).¹¹ The systems of government can be classified in other ways also. Within each of these systems, there will be more subdivisions. Notwithstanding the types, each

¹¹ Paleri, P. (2008). *National security: imperatives and challenges*. Tata McGraw-Hill Publishing Company Ltd.

governmental system will also have its own style of governance based on the individual protagonist guiding it and the compulsions under which it is governed. One can conveniently conclude that any type of government is fine. The type doesn't matter. This is a vital argument this study poses to the scholars. It is the governance that matters. To start with, the entire question can be summed up into finding whether the country being examined is with a government or not at a particular moment. Hence ultimately there can be only two situations in a country, whether governed under a government or direct by the people without a government. A country could be a member of the United Nations but without a government at a particular time. People govern it directly. This format is called anarchy in this study.¹² It is not absence of governance but the other form of governance. It can be counted as a form of governance system in the absence of a government as an agent to govern. In all these there will be infinite variations of AR&A. It depends on the type of government among other things, not the form of government. This cannot be changed. The world will not have a uniform format for governance for a very long time, perhaps never. It will be either people governing through an agent called government or direct as an anarchy without government. There will be different types of governments (gents) in the former. Even similar patterns of governments may not be identical with another. It is not examined here. The idea is to see whether it is possible at least to standardise the objectives of governance using the principles of national security as defined.

Authority is the power to influence people. The government needs authority to govern. It acquires the authority formally by delegation from the constitution or any other legitimate source of power approved and accepted in national governance. The government has to influence people in the execution of a governance activity. Delegation of authority through constitution or other acceptable ways may not be sufficient for governing the people for maximum well-being. It will require much more than the legal authority that is delegated from a higher position. This is applicable to every stratum of governance in every human system. The approval of people beyond the instruments of delegation is paramount here. Governments may face serious criticism and barriers if they are deficient in the sociopolitical approval of the people being governed. It is not possible to get perfect approval anyway in any human system. Mere legal delegation may not be sufficient. The sociopolitical approval from the governed is a time-related consideration. Such approval is from the people who are being governed at a particular time—the time or period of governance. This situation points out the importance of “the present” to governance. A government is generally accepted for the duration of its governance. But interestingly it may be either extolled for more than what it has been achieved or criticised for what it has done wrongly or not done correctly much after it has

¹² Anarchy is a condition of political situation as a form of governance when people decide to rule the country themselves without an agent called government. There is an absence of governmental authority or law in anarchy. It is a system of governance according to this study and not a chaotic system. Both the systems can lead to chaos; the chances are more for anarchy.

finished the time. Approbation and brickbats will be seen and heard more seriously after the change of government than while it was running. This is because the people who judge them (1) generally belong to the subsequent generations and not from those who were governed during ‘the present’, hence not privy to the actual, and (2) may have various sociopolitical reasons to support or resist for gaining power during “the present”. This is also one of the reasons why historians, as mentioned earlier, skid on the assessment of golden period or put forward deviant comments based on fixated opinions as time moves on. The authority that the governed (people) sanctions to those who govern them is much more powerful in practical governance in getting things done than those constitutionally delegated for result-oriented governance. The delegated authority allows the government to hold post and continue in governance. The authority sanctioned by the people by acceptance of the government makes the job easy to perform. It is generally undemanding on the government when the governed accepts them by providing social authority. The government will be able to appreciate and understand the needs and wants of the people more evidently.

If this is understood, the next stage is to examine the prospect of convincing governance. The vacillations in the behaviour of the people will not allow governance to maximise even if the governments intend to do that because of unremitting confines of the track. Hence one can always expect a “governance deficit” in any formal system. The deficit can be trimmed to a certain level in a standardised system of governance where the national objectives can be understood and appreciated by the people also. National security-based governance is expected to provide universal standards irrespective of the people’s choice and whims and fancies of their agents to govern. The history of governance of nations speaks of many differentialities as and when the people who admire or criticize changes. Simply put, a government should have maximum authority to govern in the most acceptable way. This authority has to be legally and politically delegated besides sanctioned by social approval, the “social sanction”. Here one can stumble upon a major point: standardising national security concept. National security standardisation for governance helps a government to overcome the authority deficit in the system by understanding the definiteness of the goal of governance. This is an important aspect in looking at national security from the overall perspective of human well-being.

In the Hindu mythology *Ramayana*, Lord Rama was depicted as the perfect human and the most venerable king for whom people’s well-being was the ultimate consideration.¹³ Even he had a critic in a traditional washerman whose comment made him to make a decision to banish his wife, Queen Sita to the forest and painfully renounce her though he loved her, as the best and perfect husband. The mythological treatise penetrates human consciousness in its allegorical depiction of the values and virtues of human life as considered by knowers, whereas the point

¹³“Rama”. Wikipedia. The entire life story of Rama, Sita and their companions allegorically discusses duties, rights and social responsibilities of an individual. It illustrates *dharm*a and dharmic living through model characters. <https://en.wikipedia.org/wiki/Rama>. Accessed 23 March 2020

highlighted here is that no ruler or government could hope for the perfect authority scenario in governance. This makes a government to deviate from the purpose by using other means of force and abuse the power. This is where standardisation of the objectives of governance can support. Handicaps under authority deficit can be overcome by unvarying objectives in a universal manner to limit governance deficit. The standardisation of governance for the well-being of the people by maximising national security as identified itself provides for authority in governance that could smother the authority deficit, if any. This is the third part of authority support. The three parts are the law, people and national security process regularised for governance. The third aspect is missing in all governance procedures today. The other two are with much dissimilarity and deficit. This makes the government in power to govern the way it needs to govern. The need is that of the government in power more than that of the people.

In a vacillating authority scenario, the responsibility, the enduring sense of duty of the government, also fluctuates. Responsibility is a diverse term. In governance, it is close to the feel of being duty bound. It is not just legal but also moral. While the legal duty binding remains fixed based on interpretations, moral bindings vary and perhaps matter more being personal in appreciation. Important to know, responsibility is not duty but the feel for the assigned and accepted duty. The best way to explain is that while the duty as well as the delegated authority remains the same without much deviation in a human system, responsibility, the feel towards it, will fluctuate based on the individual or group to whom it is assigned or that accepted it. In national governance the responsibility that a government feels towards its duties can change with the change of government or situations within, whereas the objective of governance doesn't change seriously.

So, what is the duty of the government? This can be answered in two ways: one is directly homing on to it and, the other, circumventing the homing aspect and searching for what it is not. In the first case, it is generally said that the duty of a government is to make laws and enforce them. The members of the government are addressed as law makers in some systems. There can be alternate views too. In the second, someone may say the government's duty is not running business or commanding the people by authority. This is where it is evident that the governments may be common but what they do even within a country need not be common. Perhaps this single factor alone, if accepted, makes it clear that governance systems are not comparable. If that is so, the metrics cannot be standardised, and the indices cannot be calibrated and validated. So, all the indices that the world uses to compare nations with each other today are imprecise by lack of comparability. It will not be so with national security index if formulated as a human index for well-being. National security index should follow a universal standard practice for comparative assessment of governance if established. It will also standardise the duties of the government at least a bit closer as the objectives of governance will be identical—national security maximisation. So, the duty of the government ultimately turns out to govern by maximising national security leading to human well-being. Rule of law, whether to run a business or not, or any other duties that were previously considered primary become activities of a government in the overall governance objective—

maximisation of national security. A government governs and yields maximum national security specific to the nation. That's all about it. That's all it has to do. It is from this principle the accountability of the government is assessed.

Accountability is normally proportionate to the acquired authority. Or that is how it should be. This is within the ideal system of management. In governance it may not hold the exact value. For example, the accountability of a government may decrease under heightened authority. An autocratic and highly authoritarian system may not be seriously accountable to the governed. Many governmental systems may not be equitably accountable to the people. They may show fractional accountability. Even in elected democracy, there are biased accountability issues. There are many governments in history as well as ongoing without equitable and proportionate accountability. Even those who are accountable may be on their own motives for retaining the support of people or hanging on under the support of those who keep them in power. Accountability, thereby, is related to power, which indirectly is the authority to govern. This is where interesting arguments can be developed on assessing the accountability of a government. According to some arguments, it is not accountability that the government has to be concerned about but checks and balances in the system. But, an authority has to be accountable to some system entity. In fact authority without balancing accountability is an unstable scenario.

Accountability, therefore, depends on the system of governance. If the system changes the objective of governance, then the accountability starts fluctuating and hunting to different power centres. If governance is based on national security, then the accountability is likely to remain less speckled. This is where the accountability of the government in governance turns not to the delegators but to themselves. The accountability of a government turns to itself regardless of the system of governance. Interestingly most of the governments are aware of this situation. This is where the system application can shift to the purpose of governance. By standardising governance under the national security principles, the overall accountability of the government shifts towards national security on behalf of the governed. This way in governance, the duties, authority and accountability remain standardised, rather fixed, whereas responsibility being of human nature continues to remain varied. The responsibility that a government feels will reflect further on the prospects of its continuation. This scenario of national governance, where the accountability of government vacillates between people and itself, is an interesting find in the theory of AR&A and may provide many clues in governing for national security maximisation. This also can lead to a conclusion that the larger the size of an organisation or a formal system, a large chunk of accountability of the governance system can shift to itself from the delegators of authority.¹⁴ This can be put in a very

¹⁴ Nowhere else this clue is more prominent than in conscription in the military. This was followed not only by rulers of the earlier periods but also even today by modern governance systems. Where do they get this authority? Certainly, not from people. Besides the conscription in the forces, unauthorised use of force is visible in many other transactions and interactions such as religious conversions, honour killings, bonded labours, etc. even in the so-called advanced governance systems. Such involvements need to be studied under balanced AR&A as a factor of governance.

simple statement, “A government loves itself (not the governed)”. If that is so, the alternative is tougher—anarchy.

7.3.2 *Governments and Shifting AR&A*

The AR&A of governments are not uniform, not only from one country to another but also from one government to another within a country. This is visible from the imbalances the governments exhibit in the process of governance regularly interposed with vacillating decisions, contradicting dialogues, adversarial debates and varying results of governance. Comparing a country with another or a government with another using the existing universal indices and metrics, therefore, may lack not only relative but also proprioceptive accuracy¹⁵. Interestingly the ship of Plato alters course every time a new government takes over. The comparison of governments and their governance procedures turns similar to divergence of apples and oranges in a debate, in the absence of a standard format. This causes the AR&A of governance to shift widely. Understanding the AR&A of national governance with respect to a specific country and a government (in the same country) is necessary to appreciate the shift of AR&A within the governmental system of that country.

The meaning of AR&A in its ideal sense has been already cited. It is the nature of AR&A in national governance that needs to be understood. Authority for a government is for the purpose of governance. A government needs the authority to govern even in the worst governance scenario. A government in power and position has it. Otherwise it wouldn't have been there in the first place. It will retain this authority to govern as long as in power. If that is so, is there a difference between power and authority? There are conflicting opinions on this.

Authority and power are the same for some; they are different for others. Yet others interchange the terms. Now the problem in this study is about defining power of a government from its authority. Naturally, in a research process, it has to be defined by the government not anybody external to it as it is only the government that knows it by the feel of it. Others have to imagine the feel. That is the way out in reality admission. One cannot get the feel of a government when not in it. The government knows not only its power but also the authority if it follows the first principle that both are different from each other. The government uses the idea of power to become (powerfully) authoritative or authority to become (authoritatively) powerful if they are similar to each other. It remains unflinchingly in command if it has power or authority as one calls the strength for governance when it has it or falls when it goes under. In the third instance, the government uses the power and the authority it has interchangeably to balance governance. It is governance of convenience where strength to govern is derived from the interchangeability of power and authority. But can three different situations exist? Ideally, such a situation is not

¹⁵The accuracy in relative assessments of governments in a country

possible. But practically it does. It is possible to appreciate such a situation in governance. Here is where the AR&A shift takes place. A government will have varying stasis of power and authority at any given time in which there could be a situation when both becomes identical for certain period, long or short. The separation between power and authority will keep varying in governance, closing and opening and occasionally lap dissolving one into another in the course of governance. The reflections of strength and legitimacy will be visible in power and authority at varying times in varying degrees. The bottom line is that the government needs legitimacy to be in position and strength to execute its activities and interventions. This it achieves through authority and power by balancing them on a moving scale continuously. It is similar to the longitudinal (fore and aft) movement of the piston rod connected to the cross head in a locomotive engine. Power and authority move in this fashion in a governmental system at a given time along a linear track. A government falls at a point when they both become null. That means power and authority are considered separate in this statement. But there is a rider introduced: though separate in this expression, they become identical when they come together at times on the longitudinally sliding scale. It is a continuous process in any government to the extent that it will be difficult to explain which of the factors the government has invoked for a particular decision—power or authority read as strength or legitimacy where power and authority both contribute to strength and legitimacy.

In social sciences, power and authority figure separately. Their definitions also vary with respect to the area of study. Traditionally, in governance, power and authority are interchanged for strength to influence and legitimacy to hold on or continue. While accountability is derived from the authority acquired in different ways and responsibility with respect to the advancement the governance organism has made to become a responsible system, authority is a reflection of the nature of the duty assigned to the entity, the government in the context of discussion here. Considering the assigned duty will have multiple activity functions, the authority of government will also flow from several sources. But all in all, it needs to be understood that authority can originate only from a source that has it in sufficient measure, because authority follows the gradient of delegation. It is a kind of the first law of thermodynamics which also governs most of the social gradients.

The attempt to identify the sources of authority of a government will not be exact if it is in a textbook format. The sources are very dynamic and continuously changing in shape and format. For example, in the traditional format, the people are a source. But it is a well-known fact that governments need not care about the people for the power to flow through delegation unconditionally. There can also be sources that are beyond the people of the country. The truism in these statements cannot be understood if taken literally.

It may be necessary to ask a question at this juncture. “Is there a difference between the governmental systems of yore and present in delegation or acquisition of authority?” Though the system should behave identical all throughout the yore and present under the law of invariance, there will be a tendency for the sapiens of the day to consider the argument that in the advanced world, as it is today,

governance should be better. Well, the law of invariance permits such appreciation. Better is not a change. It is a kind of difference, an alteration from the comparative stasis. Such an aspect could be verified critically by assessing the shift in AR&A since the time people started governing people. The AR&A shift remained the same as it is a sliding phenomenon of power and authority. Responsibility and accountability are associated with authority which in turn is based on the duty in active form. This will be clearer if the authority of government is examined.

The authority of government comes either from the people or from some source above and beyond the people. That statement is, of course, a simple truism. But as one can see, there are implications in that truism that are not generally understood. In the ancient source, the authority for a “government” to govern its subjects came from a source above the people. Well, that is what the governors said to the “governee” or the governed, not to make things complex. There is only God, of course, in different forms, above the people, at least for now. God in any form won’t deny or argue on anything if one quotes or puts to them. Sometimes they may send a sign, a friend told once. Of course, one can pretend to not see it. The governor knows it. It makes a lot convenient to the governor to hold on to power at the cost of mistaken legitimacy. The power to claim the approval from above and beyond is power itself. So one can understand in the ancient times the governor acquired the power from self using the situational support—born as a prince can make one the king; princess can become the queen. But if there is more than one claimant, somebody will “toss” somebody’s head and claim the chair, sorry the throne, the guddee. It is an accepted practice even today if the law is kept aside.

The world has dynastic principles and power factors even in today’s politics and other human activities. The authority flows through dynasty of one kind or the other. It doesn’t have to be strictly by parental birth signature. The protégé takes over the circumstantial mentor’s job. In all these cases, the authority is not flowing from an external reservoir. It flows from the inherent power reservoir. So the authority of self becomes an authority to govern that the lower formations of governees cannot deny. They have no other way but to approve even if not subservient to the dynasties. The rule of dynastic apparitions can be seen even in modern government systems. The splutter of dynastic bigwigs and extra-constitutional authorities of dynastic parasites are there in every governmental system. Power gives birth to power, and authority is conjured by those in power through manipulated delegation constitutionally or otherwise. Constitutions also have limitations. The most important is that they can be changed by those interested in changing it. Hence constitutions don’t limit power. They are dominated by power.

The dynastic authority is often called the hereditary lineage. It is authority beyond people. But that is not the only way a governor becomes a governor or a government a government. The source of authority can be acquired by conquest. In the past it was through military campaigns. Conquest by power still continues in different ways resulting in micronisation and macronisation of nations. The power of “might makes it right” to take over acquires authority which subsequently generates delegated authority from the governed. All in all people were ever subservient to governments with lone voices rebelling without power (heard of Spartacus?). Rebellions are

meant for quenching and suppressing in the power games of governance which continue into modern times. People have no serious part to play in them. It also shows that the authority to govern strictly doesn't flow from people—the governed—even in the best of governance system which everyone follows today barring some rogue (as stated by some) exceptions.

This way, “might makes right” in the governance of a nation all the time. The governors acquire might through various means. Might or force creates authority. It can also make people delegate authority to govern. The authority is embedded in the might. There is no change in human chase for power since the yore till now and will continue to remain the same in the future too under the law of invariance. The best deployment of power is holding control over a human system. This means the authority normally originates from itself. Power generates power. People obey and they do it in a contended manner all over all the time. Authority generates from people's submission. Legitimacy comes from this authority. This makes power different from authority. Power may not have the desired legitimacy but it can create legitimacy through authority. In the earlier times, people, the governed, worshipped the governor; they do it today also. There is not much change in the authority and the way that is acquired from the time of a pharaoh or even beyond to the time of the president of the world's most powerful entity and even beyond in the allocation for power, stasis of the governed and the culture of governance.

There is no denial that there are changes. Governments follow their respective constitutions or statutes or other instruments of legitimacy. They appreciate the rights of individuals. Natural and inherent rights are respected and protected. People can deny the rights to the governments to govern and replace them. All good things are written into the constitutional instruments. The nations draft their authority charters specific to their requirements. In some cases the difference can be radical which itself shows that there is so much deviation in allocating power to self by self in the name of people. But everyone voices in single chorus that people are the authority to delegate authority. It is a paradox if not a parody of the old system. It is not easy for something to change in a human system. Things change subject to the law of invariance. That is the reason why the global system needs to follow the principles of national security to standardise governance for uniformity and calibrated comparison.

Looking deep into the issue of governance will show the helplessness the humans face in a group while deciding who should govern them and how they should be governed. Often they do not get the chance to do it independently. It is always done on their behalf by a few who controls the power. In other words the decision “who and how” the people should be governed leans heavily on the “who and how” going to govern them ultimately. The senselessness of self-governance and other systems of autonomy in governance will be visible in this. In fact in almost all the situations, the governed follows the rule the governing system makes. The governing system comprises those who have decided to govern the system. This subject is deep and reflects on the basic personalities of people within a unitary civilisation. There is nothing abnormal about this power and authority distribution. That is how it will be. Once this fact is understood everything about governance becomes a bit

malleable; the rigidity and brittleness disappear to some extent. The task about inherent rights and people's decision, etc. starts appearing once the government is comfortable. The constitution and other legal instruments become the supporting tools rather than the governing tools. This perception may be questioned. But without inducing such sensitivity, the issue of national governance may be found confusing to the governed as well as the governing.

The inherent rights of birth that a human is said to acquire are philosophical issues artificially transmuted to be a legal right. Everyone doesn't believe in it in a society. This is evident in the treatment of the weak by the strong even in the so-called civilised societies though this study doesn't advocate multi-civilisations and the idea of civilisation as a social system of high thinking and relatively affluent people. That is why this study espouses the idea of unitary civilisation comprising the entire human system as a worm tunnel of people at different stages of thinking, intellect and development with everyone having a chance to go past another in matured advancement without getting directly blocked along an exclusive lane or the said tunnel. Whether inherent rights or human rights, it needs the support and understanding of the governments to legitimise. The ethnic security (Chap. 20) aspect is an element of national security today because the rights of humans are seen differently from one system to another as well as within the unitary system itself in spite of what is called the modern and advanced age the sapiens are in. The fundamental rights come from equality principles. But equality principles will not exist as long as one person wants more than the other. This aspect can be seen only through the socio-psychological principles laced with individual psychology as Adler stated about the apparent security and perceived security. The secret of governance, therefore, lies with the complex matrix of apparent security and perceived security and the gubernatorial games the mind plays in the individual human in the conflict of the two.

The AR&A issues in governance come with the Adlerian convolutions in governance which Adler himself would not have foreseen while declaring his formulations. But these convolutions cannot be appreciated without the AR&A understanding (Box 7.3).

Box 7.3 Authority, Responsibility and Accountability (AR&A)

Authority is the power of an individual to lead and execute action within a human system. Authority is either delegated (legal), acquired (customs, traditions, habits, practice and so on), achieved (personality, situations and so on) or a resulting combination of all the three. Responsibility is the feel based on authority within the individual towards action in a human system. Two or more people with equal authority may have different feelings of associated responsibility. Accountability is the answerability of the "authority" to the original authority real or perceived.

7.4 Idealistic, Realistic and Naturalistic: Outlining Governance

Idealistic and realistic theories originally dealt with philosophy of perfection or yearning for perfection in a human system activity. Everyone wants perfection; everyone cannot attain perfection.¹⁶ Philosophy, as a study in existential knowledge, developed at a time when perfection remained foggy in a particular subject or situation. Philosophy as a subject stood in for everything that could not be explained with precision accuracy but explained all said and done. The branch of philosophy that examines the fundamental nature of reality, including the relationship between mind and matter, between substance and attribute and between potentiality and actuality, developed as metaphysics which was anything but science. But science is not everything in a human perception. Humans came first; science was “invented” by humans later. This argument provides sufficient room for other intellectual escapades to branch out freely in a human system. After all intellect is the survival tool of humans. They can wield it any which way they want individually or collectively for survival. In this process, what could be explained and proven precisely with supporting parameters became science along a separate track of thinking. Science brimmed out of the boundaries of itself comprising three subjects—physics, chemistry and biology. Philosophy withdrew itself slowly from the practical human life as and when science and technology found meaning for everything, well almost. Here technology is the junior cousin of science that helps in the application of the latter for human advancement. Science also has another cousin, bit old fashioned, traditional and almost as old as it is, called engineering. Both science and engineering tango with the young technology for application. That’s fun; they are happy.

Physicists and other scientists today feel that the world knows almost everything that they should know, and theory of everything (TOE) is actually practical. But it won’t be unless the law of limitations permits it. It won’t as it is against its nature, obviously. But the ideas of philosophy do not hold much water in making life practical. It consoles the individual to rationalise when life fails or sucks. In the hunt for practicality, the ideas of idealism and realism too may turn to hogwash on one side and upfront on the other related to practicality life. Conversion of human existence into modern ideologies of better life sometimes seems to be the sole purpose of human life, that is, provided there is any purpose in human life. All said and done, there is no purpose in human life in which there is a part humans have to play. According to the author, the only purpose for life related to an individual is

¹⁶According to *Bhagavad Gita* every action is imperfect. The path to perfection is through imperfection. Bhagavad Gita course. Chinmaya International Foundation. Lesson 29. Chapter 18.17. According to Chap. 18.48 of Bhagavad Gita “just as fire gets enveloped by smoke, so too all actions are touched by imperfection”. This also governs the law of limitations as explained in this book.

to live it. “What is the purpose of life?” is still a question laced with philosophy. The answer is not evident. Therefore, one may take life itself as the purpose of life.

In philosophy, idealism asserts that “reality” is indistinguishable or inseparable from human perception and hence understanding. Idealism thereby becomes a corporeal perception that is mentally constituted connected to ideas. This statement lacks clarity. Well, that is how it is explained here with maximum clarity as perceived by the author. To turn around it can be said undemandingly that idealism is not realism provided the latter can be defined.

This statement summons realism for a definition. There are issues here also. In metaphysics, realism about a given object is the view that this object exists in reality independently of the human conceptual scheme. In philosophical terms, these objects are ontologically independent of someone’s conceptual scheme, perceptions, linguistic practices, beliefs, etc. Realism is accepting things in real terms of their aspects, rejecting those that are not. Realism contrasts with idealism. Under realism governments should be acting in their own interests which also include remaining in power. Expecting otherwise could be idealism. No, it is not complete here.

In a seminar discussion group at the National Defence University in the United States (1993), the author had spoken about the imperatives of the philosophy of idealism and realism. Though the discussion was in relation to international politics where realism holds serious appreciation on the behaviour of governments, there were references to other political ideologies leaning on liberalism, neo-liberalism, etc. The observation of the author was that considering the stalemate in perfection and also the ideology of idealism and realism is an origination of time-bound philosophy, where philosophy itself has undergone changes, it may be better to consider neo-terms such as idealistic realism and realistic idealism without clamouring for the other metaphysical concepts of philosophy. In this context idealistic realism means the state of affairs in which realism is originated from the idealistic thought process, and realistic idealism means realism turned to idealism in a process of governance.

This can be explained quoting many of the results of governance from the past but not too remote in time and present and applied to the future. The application to the future is what this study is interested in on the revisit to national security governance.

There are examples. One of them is the Gandhian¹⁷ idea of non-violence introduced by Mohandas Karamchand Gandhi in colonial India. It was an idealistic idea successfully employed in a realistic model. The idealism was based on non-violence. Non-violence is not a force. But it turned out to be a force in realism. It was not sans its quota of violence. Gandhi and his followers went through a lot of violence. Gandhian model of *satyagraha*¹⁸ was often disparaged as idealistic thoughts, especially in the initial days of development. But it yielded realistic dividends. Gandhian

¹⁷Mohandas Karamchand Gandhi (1869–1946), also known as Mahatma Gandhi, employed non-violent resistance to lead the successful campaign of India’s independence against the British rule. He was also considered a political ethicist.

¹⁸*Satyagraha* in Sanskrit means non-violent resistance started by Mohandas Karamchand Gandhi.

ideas of philosophy still prevail today not only in India but also in many parts of the world mingled in the procedures of national governance as well as in human system management¹⁹. It was effectively put in practice by Nelson Mandela (1918–2013)²⁰ in South Africa, the very country that ideated the man called Gandhi before he returned to India and started his campaign against the British in a way the world had never witnessed before. Initially there was no way to identify it as an idealistic process or realistic result-oriented route. This practice according to the author is one of the finest practices of idealistic realism and realistic idealism appropriate to a time that was fast advancing. It is idealistic realism of modern governance in which a new philosophy of governance was not only tested but also incorporated as a way of governing a subjugated human system aimed at their well-being. But those who use the *satyagraha* to obstruct governance which is much common today without results are following a model of realistic idealism that blocks governance rather than yields results. Hence the activity which a result-oriented team performs with the purpose of achieving result can turn out to be a combination of idealism and realism. Whichever is larger turns out to be what it is, and the hybrid model becomes the naturalistic governance as the way the things should move. The two ideologies are poles apart but works together. This example will be useful to dissect the much talked about apparent security and perceived security in Adler's terms.

7.5 Apparent Security and Perceived Security: Limitations of Governments

Alfred Adler's book *Understanding Human Nature* begins with a quote from Herodotus: "The destiny of man lies in his soul". Before this author recommends reframing the quote as, "The destinies of humans lie in their governments and themselves", one has to tread some distance traversing the realms of behavioural aspects that the sapiens have identified about them in the passage of time. Notwithstanding the psychological dilemma that may originate from learning about "self" by self and the prejudices associated with it, one has to see "what people need and what people want" before attempting to understand the wares of governance the governments can put in the flea market for their customers—the governed, the people. The wares are tried and used but can be sold and modified. In this statement the governed is seen separate from the government though in the real sense they are part of government along with their agents, those who govern.

¹⁹Gandhian theory of trusteeship is vocal in corporate social responsibility as a realistic principle though an idealist principle where Gandhi advocates renouncing materialism beyond what is needed and sharing with those who do not have.

²⁰Nelson R. Mandela followed Gandhian principles in his fight against apartheid in South Africa. The idealistic part of non-violence was supported by his supporters for ethical reasons, whereas for Mandela it was an activity immersed in realism with certain results.

Adler's book was published around 1927.²¹ That was about a century back. Herodotus (484–425 BC) lived much earlier, long time ago. History, in its written and spoken form, was about to start. Though a Greek, Herodotus was born in the Persian Empire. Something tells the author that Herodotus didn't like it, being under Persians. That also meant he was a learned and self-respecting scholarly person who could understand the difference of being a natural citizen and under some Xerxes²² or his likes within his own domain. He authored various historiographies, especially on Greco-Persian wars, the topic of the day. The Roman Orator Cicero is said to have conferred the title of "the Father of History" on him. There are also comments even in his time that he made up histories as he wished for entertainment and appeasements. Herodotus retorted to the comments against him stating that he was only reporting what he had seen and heard. The present-day historians and historical playwrights and makers also get into this bracket willingly or unwillingly at times. Well, that is the way past (history) "gets a new dress every time a new historian or playwright comes to the information and entertainment market". This has been mentioned earlier in this study. History can be distorted and historians²³ follow their ways. Whatever, history and the history of the present-day history started with Herodotus and continue the same way with concords and allegations.

Going back to Adler's quote said to have been from Herodotus, 2500 or more years back, "destiny and souls" were prominent philosophical terms which every human uttered and utter at least once a day. That is one way to say very frequently. They are important in governance, like in the statement "people get the government they deserve" and so on. The black box of "why things happen the way they happen" is still hard to crack. People mentioned about it as destiny. No one has defined destiny so far without using a word that is not definable. Destiny, by what it is meant, in a nutshell, is that what is going to happen to you in spite of what you may do. This carries no meaning. Now is the time to try another definition. The more one defines destiny, the closer he or she gets into a time path—at the end. It means destiny is where one reaches at the end or rather just the moment before death, the deadender point. Logically that too doesn't make any sense. It is interesting that humans use a hollow word that doesn't convey any specific existential sense, as if it is a survival need. It is not. If one wants to be accommodative in the usage of the term destiny and its retention in the lexicon and active knowledge domain, it is the experience or feel of time in its physical and intellectual form at any given time. That means humans experience their respective destinies (well, the author is not very comfortable here)

²¹ The book was in German titled *Menschen Kenntnis*. It was published in 1927 by Verlag Von S. Hirzel.

²² It was recorded that Achaemenidian kings of Persia ruled the empire to its territorial apex. Xerxes I son of Darius I ruled during the period 486–465 BC. He was assassinated by his minister Artabanus while on throne at Persepolis, Iran.

²³ Herodotus wrote in his *History* in one place that a horse gave birth to a hare. Xerxes I. Ancient History Encyclopaedia. https://www.ancient.eu/Xerxes_I/. 28 March 2020. Mark, J. J. (2018, March 14). *Xerxes I. Ancient History Encyclopedia*. Retrieved from https://www.ancient.eu/Xerxes_I/

every moment or what a person goes through is his or her destiny at that time. There is nothing special about it. For the time being, one may hold on there and look into the soul, another passing word by Herodotus almost 2500 years ago. Both play some roles seemingly significant, but very insignificant in actual sense, in governance.

Soul sounds like an entity residing in a human. “Something similar to a virus; is that so?” This was a question from a student. No, not exactly. Virus exists non-livingly, but soul? Do other living things have a soul? They do not talk about it like humans do. The soul searchers also say the soul can live in as well as out a body comfortably. Does it make sense? Whatever, one can’t think of it as a zombie or virus—not living, not non-living. It confuses the cognitive mind, the mind that wants to know. Well, what is mind then? Medical sciences do not talk about soul. Of course they don’t talk about mind too. There is no mental surgeon in the neurological department. But the terms are in usage everywhere every moment. Big theories leading to blissful *hakuna matata*²⁴ are built upon them.

Soul, therefore, is what the humans think the spiritual or the immaterial “part” of human being or animal in their perception without which they feel knowledge vacuum. Soul is regarded immortal; well that completes the knowledge, QED²⁵. Why refer to soul here, including souls in animals (and other living things?) when it was already denied earlier? Simple, humans refer to souls in animals, and soul comes under governance if humans and animals have them. Whether it exists or not in reality, souls do exist in belief system. They also, therefore, exist in the agenda of a government. Summing up the Herodotian quotation sans both to what the author stated above becomes easy except the fact that the governments may have to think of both—destiny, though non-existent, and the soul though unseen (and many others in the idealistic realism mode), for practical human system governance. The governments have to recognise them—destiny and soul, what Herodotus mentioned. With due reverence to Herodotus, the author must at least submit that the “destiny of a human doesn’t stay in his soul”²⁶. It stays with the subject human as long as alive, as a function of time.

The government is (has to be) the provider of destiny where the government also includes the governed (mentioned earlier) if the comment on destiny, here, is acceptable. Keep the Almighty God away, please, for now. God is bigger than governance. But destiny and soul are part of the agenda.

Both the governing and the governed jointly make the government experimenting with checks and balances as perceived by them in a human system even in ancient times. But the reality in this idealistic comment is that the governed is always seen separate from the government as a client or stakeholder. There is no change and it is not likely to change. Governing systems can change but not the nature of governments. This is the key to governance. How does it become the key? Because, there is

²⁴“*Hakuna matata*” means “no-worry” in Swahili.

²⁵Used in social sense as argument completed, not as demonstrated in mathematical sense

²⁶Moments ago it has been said that humans believe souls exist in animals also. Does it mean that animals too have destiny, which is still ill defined?

no other way known to humans to govern except through conflict-induced balance. The government has many limitations, and so also the governed, if seen separately from the client's point of view. That is better to appreciate the system of governance. The limitations of governance have to be overcome for maximum destiny appeasement to the soul. What do they come as—need or want? None, but as some kind of anxiety regulators if well applied. Governments need to understand it. A mob exodus of a million can be triggered by just twisting the “tail” of one among them glaringly. The group behaves as one under the sublime suggestion. Governments can try this. Within all these reticent conditions, the job of a government is to reason and question in the effort to maximise national security in the best possible way. Can a government do that? Practically not, but can guide itself towards it. That, if done well, is sufficient because of the convolutions of apparent security and perceived security in a human system that are widely differential in singularity.

In the study of human needs and wants, the needs take priority. It is the urgent requirement. Fulfilment of needs makes the person to think of wants. Maslow has explained about it in the hierarchy of needs. For him the wants were also included in the hierarchy of needs. It has to be explained with certain differential approaches in the study of governance. But prior to that, one needs to understand the type of behaviour a human exhibits in a human system. In the study of human requirement from the point of view of governance, a human exhibits three dominant behaviour patterns:²⁷

- (1) As an individual exclusively focused on personal needs and wants.
- (2) As a member of a group willing to sacrifice the individual needs and wants for the group needs and wants.
- (3) As an individual in a group with individual needs and wants taking priority, at the same time leaning towards group requirements explicitly. This is the common hybrid behaviour in an interactive human.

It can be said in general that it is more comfortable for a human to assume the hybrid pose in daily behaviour. This means human needs and wants continuously fluctuate between individual and group requirement with, of course, priority over personal moods and response behaviours. This is the reality situation. It is left to the government to adapt to it rather than expect and attempt to change it. This is also what is happening within the clash of apparent security and perceived security.

There is a general argument that humans are inferior to other life forms. Adler felt that way.²⁸ Most of the people believe it and find fault with humans for destroying the world by greed and other cardinal sins. Though not clearly established, the perceived fragility of humans in the quest for survival is very visible. People need human-favourable conditions for survival. That is so for every life form. They all

²⁷ Paleri, P. (2018). *Human investment management: raise the level by capitalising human*. Springer Nature Singapore Pte Ltd. p. 5

²⁸ Adler, A. (1927) *Understanding human nature: A Key to self knowledge*. Bellingham: Alfred Adler institute of Northwestern Washington. As seen from the standpoint of nature. p.28

need “them-specific” survival conditions. That means every life form is fragile. The whole life can be concluded fragile under this argument. It doesn’t matter what they breath—oxygen, carbon dioxide, hydrogen sulphide, nitrogen and so on.²⁹ Favourable conditions are part of natural conditions but specific to a living thing including humans. They will be limited for each life form. The law of limitations says. Therefore humans cannot be superfluously inferior in comparison. They are the only non-endangered species in the absence of a life form above and capable of superior control so far. That is how they look. The argument that other life forms can turn into non-endangered species, etc. in the absence of humans is an idealistic view, but converting the view into the natural mode closer to realistic idealism speaks a lot about the things as they are superior by intellect as their survival tool. The centre point is that humans and other life forms are destined (brought destiny here as a word of convenience) to live together balancing each. This also means they will balance each other using their survival tools, intellect being that of the sapiens.

7.5.1 Retracing Role of Government

This study considers a government an agent of people for governing people. There are various types of governments under such format. What a government can and cannot do remain concealed in its specific role. The role of a government, in a nutshell, is to provide for the well-being of the people. But no government can assure total well-being to the people. Maximum a government can work towards apparent security. This is seen every day the world over in governance. Apparent security covers the needs of the people. The study of national security is primarily on understanding the needs of the people and who should and how to provide them. In this process the elements of national security and terrain specificity matters in the format of governance in a straightforward manner for any government. Maximisation of elements by integrating the terrains of national security in governance is expected to maximise national security with respect to the needs of the people. Does national security get limited at apparent security or go further into the perceived security domain of the people is the big debate in governance. The needs are covered under apparent security. Ideally speaking, that is all what even the best government can provide. But apparent security alone doesn’t satisfy the people. The well-being, therefore, is at stake even if the governance is well done.

The authority for performing an activity is limited to the ability to perform that activity. An individual or a group cannot perform an activity for which it is not capable even if extra authority is delegated. Authority alone will not help someone perform an activity that he or she cannot. Government cannot provide for the

²⁹Living things are classified in many different ways. According to one there are humans, plants, animals, fungi, protists (unicellular eukaryotic organism), bacteria and virus (non-cellular and non-living but living supportively).

perceived security of each and every individual. It is a complex matter. The elements of national security stop short of perceived security demands. But well-being means apparent security and perceived security. Therefore a government should functionally perform in two different ways.

Prior to that it is necessary to understand that an individual human or a group of humans always look for perceived security leaving the apparent security to the government to fulfil. There are many outlets for the people to gather perceived security under various situations including conflict. A government will be able to support it. The outlets for perceived security are many. The government's support is more important than restrictions in preventing convolutions in apparent security and perceived security. This is the most viable method of governance today—the government focuses on apparent security to the maximum by integrating the terrains of national security maximising elements by balancing each and providing absolute support to perceived security factors without prejudice to apparent security and avoiding conflicts in perceived security activities. Abstractions do not hold water in realistic discussion. Another century from now, things may be different. Or will it? One doesn't know.

7.6 Nation, People and Government: Triad of Governance

A triad is an interesting concept, perhaps started on symbolically modelling power, energy and determined intent (also a triad composition) since ancient times. The triad generates powerful suggestion in the human mind about the associated topic of reference even if it is on crime (see Crimes3⁺ in Chap. 6).³⁰ It will be interesting to study the polyvalent and rich symbolism and suggestive powers of tridents in human lives.

Starting, perhaps, with the Hindu trinity of Brahma, Vishnu and Shiva, the trident of Lord Shiva (*trishul*) and one of the weapons of Goddess Durga, again in Hinduism, and passing through various power symbols such as the weapon of Poseidon, the Greek God of the Sea, and his Roman equivalent Neptune and ending at the present-day motive of musical notes and cyber security configurations,³¹ triads have been an easy symbolisation used for convenience in knowledge dissemination. In the middle periods, the triads represented various religious endeavours: the triangles in the *yantras*³² of Hinduism; the Christian art form representing the

³⁰The Crimes3 principle is an interesting concept of a triad though all triad are not alike. It is all about the unlawful activity of trafficking in three critical fields—arms, drugs and humans. Remove one the other two may lose glitter. The question is which one to remove. The problem with the author is whether organ trafficking is part of the unlawful quadruple. Presently there is no evidence to link organ trafficking with the triad. It is seemingly a different activity tough transnational powerful. Hence added +.

³¹Cyber security follows the principles of the CIA triad: confidentiality, integrity and availability.

³²Mystical drawings that honour tantric traditions in Hinduism used to worship the deities

Trinity, the Father, the Son and the Holy Spirit; and the symbol of Valknut consisting of three interlocked triangles of ancient Germanic peoples. The triads also influence the colour wheel and various groups which are associated with power. Triad set-up is supposed to bring harmony to a situation or rather balance the three elements by joining them. It doesn't end here.

Supporting triads are everywhere, and the number three is supposed to be powerful in some belief systems. The triad is used to explain even firefighting—heat, fuel and oxygen. The result, whether constructive or destructive, will peak when all are together; pulling out at least one will condense the effect. In business the subject of business, government and society (BGS) triad is a powerful configuration.³³

The convolution of apparent security and perceived security can be understood if one can see the entire concept of nation, government and people as a triad. It cannot be visualised if they are seen separately. In a combined format, one will inclusively impact on another in governance. A nation is formed only when there are people. It is one of the conditions for a nation to become a nation. There can be people without a nation but not a nation without people. It will not be stable even if artificially created for experiment. Once the conditions are satisfied, the people of the nation will not be able to manage without a government. There can be temporary situations, when a nation is without government, but never a situation that is prolonged because without a government the people and their nation will disappear in the black hole of anarchy.

Based on the examinations so far, a triad of nation, people and government will give an identity to a model that will usher in the concept of national security which is limited under the convolution of apparent security and perceived security. The concept has three points (of the trident), all sharp and complex that together have to hunt for the well-being that people and thereby the entire triad will need under sustainable governance. The welfare of the triad will ensure the well-being of the people, strength of the nation and sustainability of the government. The mode of the triad is given in Fig. 7.1.

7.7 Convolution Under International Inadvertences

One needs to admit that though the world human system is not system definable as unitary, the world is global in human perception. It has been global since the early times, and human system cannot discount global interaction for survival and sustainability. There are more global commons than restricted niches in geoproperty including nations in the terrain specificity of nations. Inadvertences in them deny the flexibility of manoeuvring to people who belong, in real sense, to the entire planet not just fragmented and splintered parts of it. Governments who understood this had

³³See Paleri, P. (2020). *Corporate social responsibility: concept, cases and trends*. Cengage Learning India Private Limited. p.4 and 9

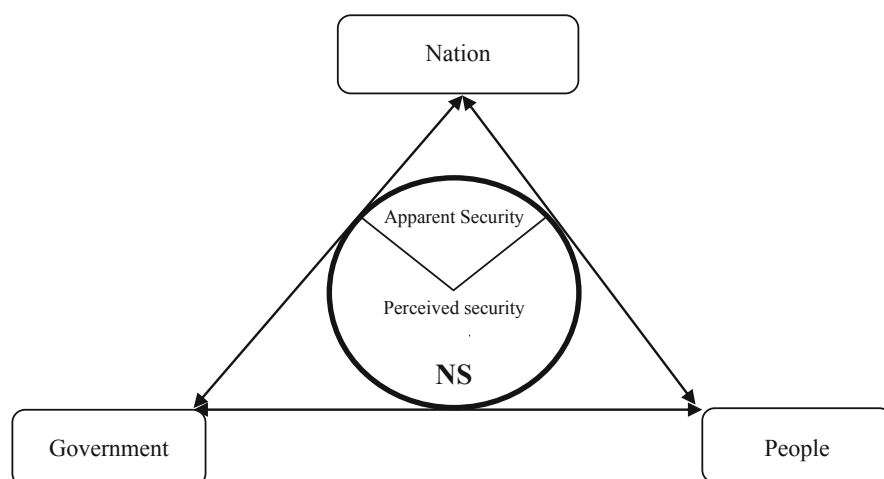

Fig. 7.1 The triad of nation, people and government

been able to exuberantly govern without having to sacrifice individual and group privacies including territorial instincts. It means international involvement is a basic necessity for governments to unfold decision convolutions. People are the owners of their country. They are on the lookout for competent government to govern their state, from within themselves. They want resilient governments that could govern their countries towards prosperity and triumph where the well-being is maximised. They are not looking for utopian dreams. The accountability matters in such situation. In this saga the nation should be acceptable for the world community without inadvertences. The posit of governments on human concern should be pragmatic and illusion free. This will lead to unfolding of convolutions in governance in the nation.

The task of governance is not complex, but making the people and the world know the good intentions is difficult. One of the elements of national security is geostrategic security in which the attention of the government is strictly external. Normally in the context of geostrategic security, governments look at the world through their respective countries and decide. This, according to the author, is a mistake governments can make. Insularism develops from such outlook. That is human nature. Visualising the ocean standing on the beach is different from panning the horizon for the land and approaching it from the sea. An aerial vision supplements the views and feelings of the land below in relation to the air space much better. It is a kind of global empathising that the governments have to develop to overcome inadvertencies leading to convolutions in human systems. Visualising one's country from the perspective of the external world is global empathising. This is an important aspect of geostrategic governance. Such understanding being with the people of the world will do well in changing perspectives of a nation and those

around it till the global perimeter. It will help to unwind the convolutions in national security governance.

A nation, whichever it may be, should seek greater solidarity with neighbouring countries. This will prove oneself responsible. Foreign policies shaped in “all for one, one for all policy” of the three musketeers led by D’Artagnan³⁴ reflect in the theory of international inadvertence. It is not coalition or group formation which nations still indulge in the twenty-first century. It is not easy to change as they remain as vestiges of centuries-old international policies and politicking. But they can be altered sincerely to limit inadvertencies.

A nation can become a symbol of harmonious well-being among global nations by international engagements sans nefarious intentions laced under deception. Earning global appreciation and confidence is one of the tools available to a government to fill the gap between apparent security and perceived security felt by its people. The appreciation has to come more from the people of other countries than their governments of the day. The former lasts longer. Absence of such appreciation and associated negativism is the major cause for convolution in national governance especially under multitude of demographic ethnicity. The larger the demographic bandwidth, the wider will be the gap between apparent security and perceived security that will tell on people. People crave for both and the government can only feed apparent security directly. This has been mentioned earlier.

Blaming developments in international systems is not a sufficient excuse. A nation should be able to guide other nations towards their resolutions on national security. Firmness and associated power are requirements or involved in international dealings and leadership. Domestic policies and their effective and firm implementation overcoming constraints help other countries to sit up and watch. Thereafter they will listen and follow suit. National stability and steadiness will overcome not only domestic inadvertencies but also international misgivings which in turn will support geostrategic security efforts.

A country should be able to stand with dignity among the world of nations for this. It doesn’t mean it has to be on the top but advanced in governance to meet the requirements of its people in apparent security by balancing perceived security. It is not an easy task but there are nations and governments who are at it and succeeding.

³⁴Originally in Latin *Unus pro omnibus, omnes pro uno* is a phrase that means One for all, all for one. Today it is the unofficial motto of Switzerland. The French version, *Un pour tous, tous pour un*, was made famous by Alexandre Dumas (1802–1870) in his novel *The Three Musketeers*. D’Artagnan was the central character who join as the fourth musketeer.

7.8 AR&A Mismatch: Universal Dilemma and *Gita* Paradox

Ultimately those who govern and the beneficiaries of governance are humans. The result of governance and their appreciation will depend upon the stakeholder salience³⁵ on both sides—those who govern and the governed. Authority, responsibility and accountability even if balanced in perfect measure cannot achieve the maximum objective of governance unless there is knowledge for governance and correct appreciation of the results by the stakeholders. More important is the knowledge that backs the authority. It can be missing. Authority should be backed by balanced knowledge for executing the assigned roles and functions besides responsibility and accountability among those who are involved. This need not be the case in human system governance. Improper and insufficient knowledge of governance coupled with prejudices and retarded dissipations among those who govern and governed can tarnish governance and its results. Those who have the knowledge may not have the authority; those who have the authority may not have the knowledge. It is important that knowledge and authority match for rightful intervention and execution of governance. This is the crux of the problem in governance besides imbalances in AR&A. This is not new. It has been there since the times humans began governing themselves either directly or through the agent called government. The process of governance in many fashions within the two forms has been going since humans existed in systems. It is evident from the last stanza of perhaps the most ancient scripture *Bhagavad Gita* if the author's interpretation is acceptable (Box 7.4).

Box 7.4 *Gita* Paradox in Governance

The last verse (701)³⁶ of *Bhagavad Gita*, the ancient Hindu scripture, is Verse 78 of Chap. 18. Translated from Sanskrit it says, “Wherever there is Lord Krishna, and wherever there is the supreme archer Arjuna, certainly there will be endless opulence, victory, prosperity, and righteousness”. This sums up governance sans convolution in the author's version where Lord Krishna is knowledge that guides Arjuna the executor balanced with authority, responsibility and accountability. In this the executor is astutely separated from knowledge in spite of balanced AR&A. That is the reality of convolutions in governance. In laid back expression, it can be said that the authority may not have the required knowledge and the knower may not have executable authority, a tragedy of sorts that can certainly be wheeled over.

³⁵Paleri. P. (2020). *Corporate social responsibility*. Cengage Learning India Private Limited. pp. 138-39, 141 and 148

³⁶There are 701 verses (*shlokas*) in *Gita*. But there are different opinions. https://www.holy-bhagavad-gita.org/chapter/13/verse/1#_ftnref1. Accessed 20 January 2019

7.9 Summation

Governance is not complex. It is about people's cooperative living in a collective human system the largest of which is a nation today. Being collective it also gives hope for a future global system provided the citizens of the world become a formal definable system with a system boundary. People govern themselves in the hybridity of the singularity-differentiability principle. The singularity factor is constant in a human system (people behave alike), whereas differentiability (people are different) is a variable. There may be a catch when humans are analysed independently with respect to time. That is when things change. This creates convolution in governance and the results. Governments need to understand it. A plan made by a government or a question raised by the opposition in governance stands to change at a later stage. What a government opposed while in opposition may be programmed by the same team while sitting on the other side if elected in majority. Normally they are criticised for it. But that should be done only after taking into account the fact that decision can change with time for the same individual or group. It is not convolution in decision-making. It is natural.

The issues of convolution in governance come from clash of ideas in needs and wants and impact assessments of governmental interventions. It is a subject that only government administrators and executors can decide. There can be convolutions in a multitude of interventions in national governance. They are because of decision and process problems. Further they can get convoluted during interventions. For example, a government may decide a plan of action in a pandemic situation. That may clash with the needs and wants of people. Here the government will invoke rule of law. It can further convolute during intervention and in course of time. This has to be handled by feedbacks and corrective measures. But the crux of the issue is the people who are governing through the agent normally. People are important for the government. Governments should know this fact because it is they who are governing though through an agent. This agent, the government, is not people; people are government. Government should know this even in an autocracy. It doesn't happen normally. That is why every government collapses, some under the law of the constitution (as in electoral democracies) and some by other limitations. It has to happen invariably in any human system.

The term convolution is used to emphasise that the issues in governance can be unfolded and resolved with effort. No decision can be totally destructive, especially so when the decision-makers are generally competent in governance and there is no knowledge-authority mismatch³⁷ in decision-makers. But it could be different from nation to nation. Large, geographically complex and demographically dense nations may feel enlarged convolutions in governance. Ultimately it is about satisfying the

³⁷ Knowledge-authority mismatch is a common problem in governance in any human system. This is a large subject by itself. The problem can be resolved when the decision-maker in authority understands the issue well. One needs knowledge to make a decision and the required authority in a balanced manner to execute it. Any difference can cause convolution in governance.

needs and wants of the people as they pervade well-being. Electoral democracies are comparatively more complex as authority is devolved to people. Such systems may show tendencies to authoritarian democracies only to make people behave the way the government wants. People lose control over government as their own agents. It is a danger of convolution. Convolution can appear in every human system from nation to the smallest, the family.

The convolution can appear everywhere every time in governance: shifts in federal-state-local relationships that may involve bills, funding, aids, cooperation in sustainable development goals, infrastructure priorities and so on. There can be clashes in centralised, categorical control to the administratively simpler devolved approaches to programs and activities. There can be convolution about welfare schemes. Convolutions can be unfolded or explicated by devolution to some extent. But often it may not be possible in the national interest equity and equality. Rule of law can be handy under such cases. It requires enforcement friendly laws even where the need for them is not emphasised originally. Every government has its own signature that leaves a mark on the system which is attributable greatly to differentiability in individuals and groups. The government as an agent is also made of people. The convolution in governance is a static reality as it is all about human behavioural conflicts for survival. There could be many attributes (Box 7.5).

Box 7.5 Takes on Attributes of Convolutions in Governance

Narendra Modi, the prime minister of India, while campaigning in the state of Kerala, India, for the assembly elections, 2021, mentioned that the Indian political system was suffering from five serious illnesses: (1) corruption, (2) casteism, (3) racism, (4) criminalisation of politics and (5) family-based nepotism. He called it vote bank politics.³⁸ But there is more for a researcher in human system behaviour to explore. Ultimately it is about the behaviour modified towards vote banking by those who govern or in the business of governance in the political system in India. This is applicable to all those who are in the business of human governance as a career in every type of democratic form of governance. Their inherent insecurity for survival in politics reflects in the attributes of governance and associated convolutions. It is not about the insecurity of people for whom they perform governance as agents. The insecurity is more among those who govern than those who are governed. This causes the convolution. Every type of government and the associated political systems of governance generated by it will have similar problems apropos the feel of insecurity among governments.

People shift radically towards resilient governments according to their perceptions. The anteforce will oppose it till the end, also according to its perception.

³⁸“*Ethanum Swarnakkattikkuvendi LDF Keralathe Otti*”(Malayalam). *Malayala Manorama*, Kozhikode. 31 March 2021. p.1

Changes in perception may help to unfold convolutions in the latter. In the former, the attention of the government should be not to allow convolutions getting generated. An interesting aspect of handling convolution which quite a few nations realised is the international solidarity with neighbouring nations and their neighbours to the extent of the global perimeter. It is possible to achieve such solidarity with other countries as the world is revolving on binary axes. But it is just an idea. This cannot be achieved in a short span. Sometimes even the period of a government will not be sufficient to achieve it.

8.1 Introduction

The role of government is a much debated issue not only among scholars and experts engaged in the subject but also among all other discussants including governments around the world. The first principle in this assessment is that one should understand a government is not governance (Box 8.1). There are more divergences in this study.

Box 8.1 Government and Governance

Both are entirely and interventionally apart. It is similar to saying an individual is different from his or her action. Heard of *Karma*¹? If not, do not bother. The government is an entity that functions as the agent of the people assigned with specific duties with delegated authority for governing them through checks and balances. In this process, the government feels responsible to govern and is accountable to the nation and its people. Governance is the entity action. People have to govern people in the human system for the reason that they are social species (more at Sect. 8.2). There is no other way to manage their affairs of survival. People may not like the agent unanimously for governing them. However, they accept them even by non-acceptance submissively, coercively, rebelliously and otherwise. Here a government performs governance. The performance will differ from one government to another or within the same government in different periods.

A government is an entity with its own personality. It is in the absence of such entity governance assumes the pattern of anarchy. Anarchy is the only other form of governance since the time human system governance originated. For that, governance is the process by which people decide to govern themselves. There are two processes of governance: governing through an agency called government, where people participate by acceptance or non-acceptance of the nature of government, or without an agency where people decide to rule themselves mostly in clusters though the concept of nation may still remain. It is meant to be anarchy which the author calls instant governance for convenience of appreciation, though, actually, it is not. Anarchic format in governance may lead to self-destruction and subsequent micronisation unless a government is created to regulate wholesomely before chaos sets in. So, anarchy is when only the people handle instant governance sans an agent. All types of governance a people are engaged in with or under an agency, the government, are considered democratic in this study because there is peoples' participation in all of them under different names according to their typology. This participation is by acceptance or non-acceptance that takes on different formats in all types of democratic governance (Box 8.2). This clarity is necessary to avoid semantic dissonance in this study. This study does not consider humans can rule themselves in any other form or with absolute *consensus ad idem* which, of course, is

¹ Karma is a word in Hindu scriptures meaning the result of a person's actions as well as the actions themselves. It is a term about the cycle of cause and effect. According to the theory of Karma, what happens to a person happens because they caused it with their actions. The word is used here to explain the difference between a person and his or her actions. In this study, governance is karma of the government, and where there is no government, the people who attempt to govern directly by themselves is anarchy. It is also karma or the action that will follow results. However, karma is a much larger and all pervading term in Sanskrit with various meanings. It also involves the effect or the results that will further become the cause. This is important to know in the governance of a nation.

not consensus as its lexiconic meaning. It will always be by themselves (by the people) under conflict with (democracy) or without a government (anarchy). The reiteration is that democracy and anarchy are two forms of governance in this case. The government in the democratic form will be one among many types, all governments. Many were there; many are there; many may still emerge. Human experiments to govern themselves are expected to continue. This appreciation is necessary to consolidate the study on governance by national security (GBNS).

Box 8.2 Only Two Forms of Governance: Democracy and Anarchy

Simply put, it is reiterated that a democracy is the form of governance in this study, where people consent to participate by acceptance or non-acceptance of a government, who acts as their agent to govern them. No country can be called anarchic even if there is violence or extreme turbulence in governance as long as it is governed by a government. Anarchy is the other form of governance when the people themselves decide to govern without an agent. This makes the much touted term “democracy” or the democratic rule as the electoral democracy, no way different from other types in terms of people participation except in the process of choosing or submitting to an agent as of now because even in it only a select group of people are favoured by governance. In every form of democracy, there is always a section of people who oppose and get opposed by their government. There are also selective benefits of governance. Equity and equality goes for a toss. That is human nature, at least till now and that is as long as one reads this book. That is natural to human behaviour. That is part of the law of limitations in the case of a citizen. Equity and equality is impossible to achieve by governance, as on today, whether in democracy or anarchy.

To conclude in the box, democracy is governance by peoples’ participation through a government as an agent for the people. Participation is acceptance as well as non-acceptance even under conflict or submission. Anarchy is governance by people sans the agency called the government which will also have people who accept or not accept the rule but will submit to it. One of the clear examples was Somalia 1991–2012.² In anarchy, people govern without a government. Somalia was often described as the “most failed state” and “lawless” country where there was “nothing” left.³ This study does not agree because under the concept of national security there is no failed state but only failed governance. This adds to the push for the rule of law as the role of government.

²Stremlau, N. (2019). “Governance without government in Somali territories”. <https://jia.sipa.columbia.edu/governance-without-government-somali-territories>. Accessed 29 June 2020.

³Watch the title in note 2. Governance without government means governance is differently placed: one with government (agent) and another without government (anarchy).

A better form of governance is the yet impossible stasis in a third format, where both the citizens, accepted and not-accepted, though participative, benefit from governance. In such consensual governance, the not-accepted participates equally forcefully, as the opposition to maintain progressive checks and balances, not in outright opposition or hostile confrontation to pull down the rival however competitive it may be. This is an impossible dream as on date and in the near future, but there are trends of its evolution in some electoral democracies. People awareness is the key. However, it is not possible as the model of human system is a worm tunnel unitary civilisation. In such a system, keeping checks and balances becomes adversarial. Indian slogan of *Sabka sath, sabka vikas aur sabka viswas* (with all, for the development of all under the trust and consensus of all) is a wish or a dream in that direction⁴. It is impossible if the opposition goes beyond the normals of checks and balances (2020). A study of this nature should focus on prospecting truth from facts without prejudice to knowledge acquisition for further research and studies in human system governance.

In the midst of all these debates, the roles of a government are far too many. They are nation specific and focused on national security towards human well-being. They are also situational. None of these roles can be prioritised among themselves. They are considered according to situations and the urgency of governance as deemed fit by those who govern. The onus of decision is on the government in a democracy. There is a role that is common to all governments: rule of law. It is applicable not only to all forms of democratic governments but also in anarchy, when the government is the shadow of the people themselves. In anarchy, rule of law may delay chaos and ultimate destruction and micronisation. In democracy, rule of law will improve sustainability of the system. Serious studies in anarchic governance will show establishment of rule of law existed as deemed right by the law within, though such societies are normally called stateless. Stateless is again a term of convenience used in a situation of helplessness. Somalia, even under anarchy, was a state recognised by the UN. That is reality. The state had law as appropriate for it in anarchic governance too. The piracy organisation in Somalia was termed a coast guard⁵ by the anarchic government with a purpose among various other transformations of law and enforcement.

Establishing “rule of law” following the “due process of law” is one of the roles of a government. There is no argument on this issue. The citizen looks up to the

⁴The slogan has been changed during the independence day celebration of India on 15 August 2021 with an addition of the term ...*sabka prayas* (efforts of all). The Prime Minister added, “Sabka Saath, Sabka Vikas, Sabka Vishwas and Sabka Prayaas is very important for the achievement of all our goals”. <https://www.hindustantimes.com/india-news/on-75th-independence-day-pm-modi-coins-new-mantra-adds-sabka-prayas-to-sabka-saath-sabka-vikas-101628991997543.html>. Accessed 21 August 2021.

⁵Somali pirates during anarchic governance (1991–2006) were formed from a group of people who were trained to be members of the coast guard if the country was under any of the forms of democratic governance. In anarchic form, the coast guard became pirates as called by others for the same purpose: to enforce law at sea that the governing people claimed but became chaotic.

government of the day to establish “rule of law.” It is necessary to reiterate here that rule of law is not an element of national security. It is a function of governance. In a responsible sapient world, establishing rule of law demands making “enforcement-friendly laws”⁶ and their enforcement. Enforcement is not about use of force. Law can be enforced without using force even under extreme provocation as seen in the USA on 6 January 2021 days before the change of leadership and India on 26 January 2021 the 72nd Republic Day (Box 8.3).⁷ Enforcers of the government need to be given credit for that, especially considering the pressures they would have undergone against the anteforces. Both incidents took place in the respective seats of governments, at the centre of gravity of governance. Rule of law is an activity profile of governance under the presumption that people can violate law which will impact upon the law and order situation in the country. People violate law individually or in groups when they seek apparent or perceived security for themselves, generally. Often they are not aware. It is said that people will take law into their “own” hands when government fails or for other reasons.⁸ People do not like to wait. They are restless like a bunch of fidgety kids left alone. Whatever, people violate law, because they cannot think of anything else in a confusing and demanding situation that happens frequently. They do it when they feel arrested by limitations induced by law and under survival. People break law when their survival emotions burst through the seams of insecurity. Everyone does it, including law makers and law enforcers. Funny, is not it?

⁶Paleri. P. (2010). *Maritime security: the unlawful dimension*. Magnum Books Private Ltd. p. 8, note 15.

⁷On 6 Jan 2021, the US Capitol was stormed by supporters of the outgoing president Donald Trump. The protesters saw it as a last-ditch, desperate attempt to overturn the incumbent Joe Biden’s victory in the race to the White House. This became a black mark in the US governance as it prevented orderly transfer of governance besides causing four deaths and quite a few injuries. But the enforcers stood their ground without violating norms. 20 days later, India witnessed a similar agitation in its historic Red Fort on the 72nd Republic Day. Agitating farmers from neighboring states carried out a violent attack and rioted in the capital city of India though the government had given permission for peaceful agitation to express their grievances on a proposed farm bill that could be law of the country. Here too the Delhi Police, who were in charge of rule of law, showed extreme patience in spite of provocation as did the police forces in Washington, D.C. These are the changing scenarios of the positive rule of law for the people.

⁸This statement of people taking law into their own hands clarifies that there can be rule of law when people decide on it without their agent, the government, involving in it as in a riot or awarding instant justice as some people call the process. But one should not mistake the term for people becoming violators of law when the law is actually made by them through their agents in a democracy and themselves in anarchy. Even otherwise the laws that are followed morally, ethically and otherwise are those made by the people. Hence law is always in the “hands” of people.

Box 8.3 India and the USA: Rule of Law and Sapient Enforcement (Case in January 2021)

India and the USA witnessed major changes in the format of the rule of law in the early 2021. It is a trend that indicates positive change in sapient governance, where a sapient is what the author advocates in this study—modern human as a new and exclusive entity in the national security perspective since 2020, but not in biological studies, yet. This is explained later in this book (Chap. 25).

Both the countries witnessed chaotic situations created by anteforces in their capital cities at their centres of gravity of governance. In the USA, a large and uncontrollable group of people stormed into the high security US Capitol building in Washington DC, alleging the presidential elections of 2020 were fraud, on 6 January 2021, a few days before the change of government. The violent mob trashed everything to vent their frustration disguised in anger, atypical of mob psychology under such situations. They entered both the Senate and House chambers. In India, on its 72nd Republic Day (26 January 2021), people agitating in the name of farmers entered the capital city of Delhi with the permission of the government under the assurance of peaceful demonstration. Once entered, the agitators turned violent suddenly as if planned earlier. They took to streets in rampage and desecrated the Red Fort, India's place of pride as a cultural heritage. The agitators chose the path of extreme violence and aggressive destruction. Both the cities were unnerved under shaming violence of duplicity.

The governments in India and the USA exercised unparalleled restraint unseen in the past in the enforcement of law and order without giving a skip. The enforcers went through critical trauma in their professional lives, perhaps for the first time for most, during the violence in both the countries, but they came through it with professional acuity and acclaim though many suffered physical and mental agony. It was commendable and unseen and unheard in the past in the human system where the more powerful, the state, showed such restraint, with so much confidence, over the anteforce, by taking the pressure on themselves. This certainly is a new trend in governance and also shows the beginning of sapient governance, the corner stone of human governance.

The Aristotelian find of the captain and the ship is quite relevant in governance even today at least to understand the principles behind the rule of law as a critical role of the government (Box 8.4).

Box 8.4 The Captain and the Ship

Though not exactly a simile, there is a practice of comparing a nation and its government with an ocean going ship and its captain. It is one of the ways of

(continued)

Box 8.4 (continued)

explaining national governance and the role a government plays in it. The accountability of the captain of a ship is first towards the ship and then towards the people in the nautical parlance. The safety of the ship is more important than the safety of its people. People are not safe if the ship is not safe. Captains are expected to feel responsible for their ships and its people, in that order. That, perhaps, is behind the traditional dictate of a captain going down with the ship after making people abandon it at the critical moment at sea. It happened in Titanic in 1912;⁹ it happened in the Indian Naval Ship (INS) Khukri¹⁰ in the war of 1971. The captains of both the ships went down true to the nautical tradition in an interval of 59 years. Both would have saved themselves, but preferred to be with their respective ships they could not save being simply under the limitations of being responsible humans accountable to the call of duty—sapient humans, a cut above the regular *Homo sapiens-sapiens*.

The similarity with a ship's captain is that for a government, the country comes first in priority and then the people. The government has to safeguard the country from external aggression and internal violations of all sorts under rule of law. The country has to exist for people to exist. For this the government has to make, follow and enforce laws. That is the ultimate aim of rule of law. In the absence of rule of law, national security maximisation is at stake. It is a condition, not an element.

8.2 Why Humans Need to Be Governed?

The need for governing a human comes from the human system design itself. Humans are not individual species but an evolutionary outcome of socially cooperative species. It is a survival need to be socially adaptable and cooperative. The human system is socially benevolent and is governed by laws and practices designed to regulate the boundaries of individualism. It accentuates cohesion and protects the collective norm for survival. This is primordially observed in human systems. Humans are compelled to forgo their instinctual nature for social collectivism and central governance. This is the basis of group behaviour, formal as well as informal.

⁹Captain Edward John Smith RD, RNR (1815–1912) was an experienced merchant naval and British naval reserve officer. He was the captain of the RMS (Royal Mail Ship) Titanic, owned by White Star Line, and perished when the ship sank on its maiden voyage 02:20 on 15 April 1912 after being hit against an iceberg in the previous night at 23:40. There were 3208 people on board including crew and passengers. 1900 died. “Passengers of the Titanic”. https://en.wikipedia.org/wiki/Passengers_of_the_Titanic. Accessed 18 December 2019.

¹⁰Captain Mahendranath Mulla (1926–1971), the commanding officer of INS Khukri, was decorated with India's second highest military honour the *Mahavir Chakra* (MVC) posthumously for bravery in the highest traditions of the Indian Navy.

Humans thereby encounter the nature vs. nurture challenge making them social as well as moral beings by design, altruistic in nature and simply human and humane.

This stasis of humans as a system entity was hypothesised every early by (who else?) the grand old Greek seer and scholar of moral philosophy, Socrates (470–399BCE), that life becomes just happy with a mix of gods and familial and communal bonds.¹¹ The predicament is that on one hand people demand rights and privacy and on the other help and support others in the system to survive by huddling together. There is no end to what people want to feel comfortable and secure: right, liberty, freedom, privacy, moral code, protection, safety, support, companionship. . . everything and some more. In all these affirmations, a hidden facet is that humans do not realise that they as a life form are similar to other life forms in birth and death and a large part in between. They consider themselves superior to all life forms. The reason for that is developed intelligence that can see through the fog of built in anxiety. Even then it is clear that one needs the other for moving on. All these are possible within their practical limits if there is an authority as an agent—the government. Where will the authority get its power to govern? No problem, those who want to be governed will delegate it under certain conditions that everyone will agree to, by acceptance and non-acceptance. Here non-acceptance is acceptance in a system essential for balancing it through checks. Though humans may be similar to other life forms as the dynamics of life is concerned, they are certainly superior neurologically to all others. They got the finest tool for survival, intellect, provided they use it effectively.

There are many reasons why humans should be governed for survival. The prime reason is their advanced design with intellect as the survival tool for interactive existence. However, the immediate answer from anybody will be that humans need to be governed for establishing law and order or rule of law for disciplined living. Many think belief systems such as religion establish discipline in the system¹². This also answers why there are two axes in human systems—belief systems and power.

8.3 Paradigm and Disconnect of Law

It is reported that an average person in America unknowingly violates federal criminal laws at least three times a day unknowingly in his or her daily routine.¹³ The average person mentioned here is otherwise a responsible citizen. This is the

¹¹ Sample student essay. Analysis of Hobbes' Theory that "People Need to be Governed". <https://www.ukessays.com/essays/philosophy/hobbes-theory-that-people-need-to-be-governed.php>. Accessed 20 January 2021.

¹² It came as an answer from one of my students, Muhammad Aslam, in management studies for my question about the need for religion in human life (Chap. 20). According to him without religion there would not be rules and discipline in society.

¹³ McElroy, W. "Decriminalize the average man". <https://mises.org/library/decriminalize-average-man>. Accessed 5 April 2020.

estimate of the American civil liberties' lawyer Harvey Silverglate, as mentioned in his book *Three Felonies a Day*.¹⁴ He adds that there is an avalanche of violation of other laws such as misdemeanors or civil breaches that confront average people at every turn. He attributes the reason to the explosion of new laws that are also unfeasible for citizens to follow being broad and vague in a busy day. The author opines that the American federal laws have become dangerously disconnected from the English common law tradition that make it easy for prosecutors to pin arguable federal crimes on any citizen otherwise responsible and law abiding. "The volume of federal crimes in recent decades has increased well beyond the statute books and into the morass of the Code of Federal Regulations (CFR), handing federal prosecutors an additional trove of vague and exceedingly complex and technical prohibitions to stick on their hapless targets," he states. Simply put, according to him, no social class or profession is safe from this troubling form of social control by the executive branch which impacts on the integrity of governance in the USA.

Such observations are interesting when made on the most powerful and advanced nation in the world that too by a lawyer dealing in civil liberties. Is such as situation exclusive to America, more specifically the USA or it applies to all the governments is not a matter to debate. However, it highlights the importance of law making, the job of the law makers whom in most countries the people elect and place on chair tasking to make laws and enforce them for peace on earth under the rule of law. Does it happen that way or does law make people to violate them? Something is seemingly wrong somewhere.

However, this author believes (a biomodel will show) that everybody breaks the rules and thereby a law at one time or another, knowingly or unknowingly. These may be argued as circumstantial under pressures of life or whatever reasons. People will find a reason to counter the statement by justifying or rationalising it. It is humourous to think why people defend or indict people who never asked for it. People have a tendency to spot themselves with the accused or the victim in a kind of criminal role playing and argue accordingly. This is an interesting behaviour that leads to many decisions at the highest levels in the government or social systems. Such role playing depends on the personality, which for this study is the behavioural attitude of the individual at a particular time. Or they should approach government and seek help. All these are natural (remember naturalism?).¹⁵ It does not have the tint of idealism or realism, but a mix of both. For example, not everybody would like to violate a law. But all will, if there is a behavioural demand behind it. This is a presumption more than a hypothesis. The biggest catch is that law cannot be violated unless it is there. So, first there should be a law to enforce, violate and arraign the violator. The government has to make it. Then enforce and adjudicate it through judicial procedures, specific to the domestic scenario. That completes the

¹⁵Naturalism in this study is actually reality that appears in form and shape even if virtually following the laws of nature. That arises from natural causes and properties without transcending nature for explanations into supernatural, miracles, spiritual explanations and their like.

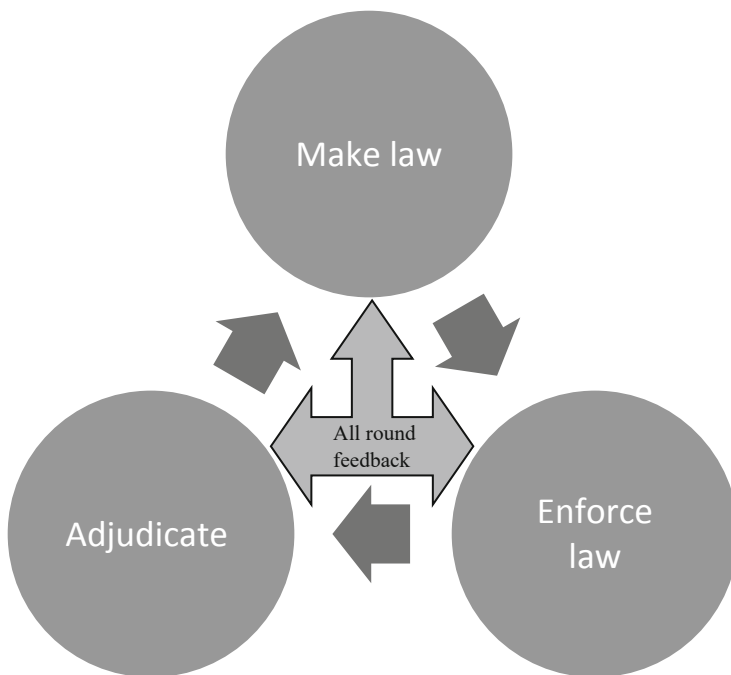

Fig. 8.1 Rule of law

rule of law through due process as a role of the government (Fig. 8.1). That does not mean the government can now sit back and flaunt its powers and laugh. There is a lot to learn from feedbacks of law making, law enforcing and law adjudication that could be carried forward for further process in repeat role execution.

Rule of law and law making do not come under the purview of the elements of national security. The process does not satisfy the qualifying conditions of national security elements, being an activity of governance. It is accepted that the law and order situation goes out of control in the absence of a government. Human anxiety fizzles out when it is not contained. This establishes the fact that a government can enforce rule of law only within certain limits. The government is not all pervading. Maximum it can contain human anxiety by establishing forceful barriers around violations of law in a social system. People are normally happy when a law that they think is useful to them is made. The government can enforce law and order by the use of implicit or explicit use of force in the society along with other socially responsible activities and measures.

Is it necessary to have laws to enforce discipline is the next question. There is no straight answer. It is in idealistic inquiry where one expects the society to be self-disciplined. When realism is invoked, it will be evident humans are not eminent or known to be self-disciplined unless it supports their perceived notions. The anxiety syndrome or the insecurity feeling is so powerful that people are enticed to break law

at every moment. Everyone breaks law at one time or another. The government has to intervene in establishing law and rule of law for these reasons.

The government's attempt to establish rule of law involves making law, enforcing law and adjudicating law by establishing justice systems through judicial establishments. It is a duty of the government. Importance of this duty will be clear by observing a country sans a government. It was visible in the post-Soviet world when many nations have been reeling under the pressures of micronisation of the former. The government has to make law (the members of the government are also called the law makers for this reason) according to the accepted practices which also means constitutional process prevailing in the country.

What if the law is no more necessary or it has become draconian in enforcement? Then, it is the same government to consider repealing it. Repeal can be by replacement or no replacement.

8.4 Resistance to Law and Law Making: Demoslip

Law making is not an easy process for any government, more so for an elected government with an identified opposition. Any government will meet with resistance in law making and enforcement from challenging inliers and outliers. Initial resistance will be in law making. Law makers are aware of it. It is resolved in different ways. If the methods fail, law makers may annul the attempt. There can be reformist and revolutionary movements in domestic and international law making though both are different processes. An interesting trend is a nation officially objecting a law or law making process of another. Resistance is the first stage of invoking checks and balances in governance. The stability of governance ideally is in the checks and balances. However, in reality, it can hinder governance and pull the country back in a surge. Smart governments can turn it to the advantage in national governance.

The other side of resistance to law and law making is that the governments should know they alone are not law makers. Strictly law is made by people in a system. Perhaps, this may be established from the theory of customary law. Customary law originates from the social behaviour through practice of a human system. It influences the law making process of a government. It only shows the law is made by the people. The government though comprises law makers are actually those who draft, examine and enact laws for the people invoking the "by the people" paradigm as the prime principle of law making.

A slip between a pulley and the belt passing over it impacts energy transfer. Similarly, non-adherence between the individual or group human and the law can cause disharmony in governance. It matters to the individual human and accordingly his or her affinity towards the government in terms of acceptance and non-acceptance. It is called the demographic slip or in short the demoslip¹⁶ in this

¹⁶ Author. Only applicable to resistance to law making.

study. The duty of the government is to minimise demossip in law making. It is not an easy task and so is governance.

8.5 What Is Unlawful?

“Unlawful” is an expression that resounds in the enforcement strategy of a government and its agencies in establishing rule of law. The word denotes something that is not acceptable under the perceived norms of a society and has been enacted or formally established and accepted as law. It is about anything in a social system that is not conforming to, permitted by, or recognised by law, rules or practice. It means not lawful according to law, not morally right according to ethical principles or conventional practice. Without complex deliberations people understand the meaning of unlawful anyway. Acting upon an unlawful act requires supporting evidences and follow up through various procedures and predicaments. It needs pure governance action by the government, being its principal duty.

Law is an ancient concept that began when human systems felt the need for rules and regulations with supporting enforcement regime. “Unlawful” implied that the associated activity was forbidden by law. An act or activity is not unlawful unless forbidden by law—that is, the dictum. Another method is to define the term “unlawful activity” with respect to the particular law in the legal act itself.¹⁷ Because there is a requirement of “violation” of an activity well-defined under the law, the activity thus committed by violation of such law has to be forbidden. A closely equivalent word from the earlier times for unlawful was “unjust”. “Unjust” leads to injustice. Justice¹⁸ means the quality of being just and fair in handling the case. That is all. Just and fair for this matter is the prevailing human system belief. That is what is expected from all involved—the government, enforcers of the government and the

¹⁷ An example is the definition of unlawful activity in the Unlawful Activities (Prevention) Act, 1967 of India. The purpose of the Act is to contain insurgency aimed at cessation of any part of India. According to section 2 (f) of the Act, unlawful activity, in relation to an individual or association, means any action taken by such individual or association (whether by committing an act or by words, wither spoken or written, or by signs, or by visible representation, or otherwise), (i) which is intended or supports any claim, to bring about, on any ground whatsoever, the cession of a part of the territory of India from the Union, or which incites any individual or group of individuals to bring about such cession or secession; (ii) which disclaims question, disrupts or is intended to disrupt the sovereignty and territorial integrity of India.

¹⁸ According to the author, the term “justice” is not without its own aberrations in usage unless defined in relation to law. Justice is not what a court gives. A court adjudicates the case with respect to the law under which the case has been brought to it. The decision of the court is based on the law and proof of its violation. The term justice stands outside the activity of a court of law. A court concludes what really happened in a case within the law pertaining to it and what should be done about it. The court decides whether the accused committed the crime and what the punishment should be. They also provide a peaceful way to decide private disputes that people cannot resolve themselves.

courts. Unjust therefore is associated with the procedures, not judgment. Therefore, unlawful is different from unjust. That was replicated in genuine usage in course of time by the more convenient term “illegal”. The divergence between unjust and just or illegal and legal explains the moral obligations and their determinants in social interaction. Illegal or unjust in customary social interaction meant prohibited by law. That again advocated the necessity of legislated law to consider an activity legal or illegal within the social framework. Without law, an activity does not become lawfully unrecognised and thereby unlawful. Essentially, the word dealt with barring of right to do things that are not acceptable to the social system as specified in the legal documents. Additionally, there is also the requirement of specifying such activities as illegal or forbidden. Otherwise, the term “unlawful” does not become paramount in acceptance. Activities that were unlawful in a society varied according to perceived civility founded in the prevailing social system. Acceptability of an activity is an important element often diverse in human societies. What is acceptable to one system may not be acceptable to another.

The author often quotes the practice of honour killing to drive home this argument in lectures and discussions especially related to acceptability and unacceptability of practices in a society. Honour killing of women is prevalent in certain societies as a code of conduct and not strictly as part of any kind of religious or cultural appeal. Such appeal in an activity is incidental once it is endorsed by law. Honour killing loses its religious or gender appeal (if any) once the government legislates the activity and brings it under the law, or if the law already exists by custom or tradition and is practised within the particular society. The basis that formed the law is incidental once the law is in place. If supported and approved by law, not carrying out honour killing becomes “unlawful”. It becomes violation of an existing law. In another society, such killing may amount to homicide—an unlawful activity. Another example, though slightly deviated in principle, is state¹⁹-sponsored piracy at sea that was prevalent in the early days. In some such cases, state-sponsored “pirates” took on relatively “unlawful” pirates. Such pirates became swashbuckling buccaneers and legendary heroes of their countries under semi-legal authority.²⁰ The

¹⁹In this book, the term “state” refers to every geostrategic entity other than the ocean divisions. According to a study by the author, there are 277 geostrategic entities (2008) in the world including the five ocean divisions. They are the members of the United Nations, territories of other countries including disputed territories, other recognised entities and the ocean divisions. In Paleri. P. (2009), *Coast guards of the world and emerging maritime threats*, Ocean Policy Research Foundation.

²⁰The buccaneers were semi-legal operators at sea. Originally, the pirates who operated in West Indies in the seventeenth century were called buccaneers. They attacked Spanish ships when France, England and Holland were trying to gain territory on the Spanish Main. They were initially French hunters called *boucaniers*. They became pirates with a cause under recognition by the party who used them. What it means in the context is that the word semi-legal only applies to the fact that they were acceptable to a party with national identities to curb those who opposed them. In other words, a state employed mercenary could fall under this category. There were also “legal” pirates or those who operated under a temporary commission through a “letter of marque” issued by a government or monarch authorising capture of merchant ships belonging to an adversary. They were called privateers or corsairs. www.wikipedia.org. Accessed 15 April 2007.

same could be said about the state-sponsored terrorism. Those with formidable geostrategic clout may term such states as rogue states and stay by their statement in a law-abiding manner. However, socially “unacceptable” activities normally will not have state sanction under the changing social order. Practice of “unlawful” activities by states induces conflict situations under international customary law. The state assumes rights to suppress such activities under the rule of law. Rights were localised in human systems of yore. Subsequently, such rights received constitutional affirmation that governed the rule of law. Constitutions were meant to provide for the rule of law under recognised governments. Even going to war became a just activity (the right to go to war—*jus ad bellum*) hundreds of years later after many wars were fought and destroyed human system and delayed or interrupted its growth and progress at random intervals. War became a just activity under specified conditions. That brought legitimacy to the combatant along with rights. Today, there are combatants sans rights under the laws of war. The term of convenience for such soldiers who fight “unjust” wars or who are considered to be non-recognised soldiers is “unlawful” combatants. Some call them mercenaries. Nations engaged in combating terror may have to fight unlawful combatants²¹ as per the expression. In such cases, is the war a semi-just (though such usage is improbable to accept under law) activity with respect to the “lawful” combatants? Are their rights as prisoners different from the unlawful combatants against whom they are fighting? Under what rule or law they get paraded or beheaded in front of video cameras aimed at the public? What happens on the other side when human rights activists scream for justice in deadly detention centres without a view to the bay nearby meant exclusively for torturous interrogation of the detainees who refuses to let go information? What is the embedded relativism in such activities? Is fighting unlawful combatants admissible under right of war or is it an activity extraneous to it? What about mercenaries or other “unlawful” combatants secretly engaged by nations to fight declared and thereby lawful wars along with regular soldiers?

²¹ Ibid, 2 April 2007. Defining the term “unlawful” becomes unwieldy most of the times. A term in the “war on terror” declaration is treatment of prisoners where they are divided into “lawful” and “unlawful” combatants. While the lawful combatant gets the accredited treatment as the prisoner of war (under the Third Geneva Convention), the unlawful combatant is denied of that. An unlawful combatant is someone such as a mercenary. To qualify as a legally accepted combatant, certain conditions are laid down under the laws of war. But anyone who does not belong to that category becomes an unlawful combatant. The question here is, “Isn’t it necessary to declare such people as ‘unlawful combatant’ in a graduated conflict situation?” But the fact remains that interpretation of law is possible only when there is one. Unless lawful act is not defined, unlawful act cannot be (also see Note 27). When law is lacking, the term “unlawful” takes a beating.

Where do child soldiers and child militants²² figure in war and combat against terror and insurgency (Box 8.5)?²³ Do they get the status of prisoners of war (POW) under the Geneva Convention²⁴ or are they to be treated as juvenile delinquents? Such questions are essentially answered by situational interpretation of the word “unlawful” and the prevailing regimes to suppress such activities. What is important here is the acuity of the word itself and its permeation in everything that humans do.

Box 8.5 Children with Guns for Lollipops

On 4 and 5 June 2021, the sleepy villages of Solhan and Tadaryat in the Yagha province of Burkina Faso witnessed a carnage in which attacking jihadists shot dead more than 170 residents and burnt their homes, UN reported. The jihadists included many children below 14. Children are in great demand in crime and disorder, from trivial to blood cuddling monstrosity at extreme bandwidth. Can law handle?

²²There are gory video clippings in circulation depicting child militants beheading hostages with knives. How will such militants be treated if captured by a recognised state agency under the human rights principles—as a child, juvenile delinquent, “unlawful” combatant, or hardcore criminal?

²³The United Nations have exceptionally reviewed the case of child soldiers. On 26 July 2005, the United Nations entered the era of application in its campaign against exploitation of children in combat, though still there is much needed to be done. The most apprehensive factor is employment of children in seaborne unlawful activities. So far there are no examples though some of the groups known to employ children in armed conflicts are also active at sea. It is not known whether they are employing child combatants at sea. It may be that the terrorists feel children are too feeble to be exposed to the vagaries of the sea. www.cdi.org. Accessed 11 May 2007.

²⁴Unlawful combatants are also called unlawful enemy combatants or unprivileged combatants/belligerents. It is strictly an expression of convenience. They are denied privileges of prisoners of war (POW) in accordance with the Geneva Convention. The unlawful combatant does not appear in the Third Geneva Convention (GC III). Article 4 of GC III describes categories of personnel who are entitled to POW status, and there are other international treaties which deny lawful combatant status for mercenaries and children. But the International Criminal Tribunal for the Former Yugoslavia in the Celebici Judgment quoted that the 1958 International Committee of the Red Cross (ICRC) commentary on the Fourth Geneva Convention that every person in enemy hands must either be a prisoner of war and as such covered by the Third Geneva Convention or a civilian covered by the Fourth Convention and that there is no intermediate status; nobody in enemy hands could be outside the law. The general argument is that human rights should be extended to all in the hands of enforcement agencies. But it cannot be enforced when the victims are in the hands of illegal players. Military literatures have been using the term unlawful combatant for a very long time, but not in The Hague or Geneva conventions. So, while the terms combatant, prisoner of war and civilian are well understood, the term “unlawful combatant” is not. The International Criminal Tribunal for the Former Yugoslavia has explicitly affirmed this principle in the argument in 1998 stating that there is no gap between the Third and Fourth Geneva Conventions. Individuals not entitled to the protection of the Third Convention as prisoners of war necessarily fall within the ambit of the Fourth Convention provided that its article 4 requirements defining a protected person are satisfied.

From the related arguments, it could be deduced that the word “unlawful” for all intents and purposes is promoted to explain socially unacceptable procedures where acceptability governs the norms for decision-making in societal interaction. The word also means that what is unlawful should be clearly and precisely elucidated along with consequences of performing such activities. It needs the glaze of law to be sustainable. An unlawful activity thus becomes an act that does not have legal sanction. Interestingly, act is also the word that explains an instrument of legislation—a legal enactment. In the global system, international law provides the rules for interaction between sovereign states provided such states claim international recognition and character. Internal laws of the states regulate the conduct for rule of law within the state’s jurisdiction. In both cases, unlawful activities are those that lead to acts that are vilified as undesirable for the subjects of identified social systems.

Notwithstanding even the perfect screening of the term, the question “what is unlawful” could cause a blur to the legal vision, if not clarified, under the internal laws of a state for carrying out enforcement operations in suppressing such activities.²⁵ More, the jurisdiction will need clarity of expression. Jurisdiction defines the territorial extent of exercising a particular law besides the authority and right to interpret and apply it. It is the extent of authority and control. Any extent will have limitations by range and authority. While states have boundaries to exercise jurisdiction under national legislation within its geoproerty²⁶, it need not be exactly so over the other terrains of national security. The terrain dimension of such activities makes jurisdiction and state empowerment hang empty.

National security is based on sovereignty of a state. There are different appreciations of sovereignty in which the Westphalian sovereignty is also included.²⁷ The world conceptualises sovereignty as a hybrid model according to the acceptability under the general consent of the people. Interestingly, in international customary

²⁵ It is also applicable to international law in the globalised world.

²⁶ G. Demarest. (1998). *Geoproerty*. Frank Cass, 1998. The terminology “property” means something that somebody can own exclusively. It could be an individual, or a society that could be a state or the world community itself. The terminology “geoproerty” has been taken from the findings of author Geoff Demarest. Sovereignty relates to property ownership. It embraces the idea of *summa potestas*, a unified authority supreme in internal affairs and independent with respect to external affairs. The author’s contention is that the term sovereignty is either a reference to the ownership of property or an argument for ownership. It demystifies sovereignty. The status of state sovereignty is more arbitrary and less valuable a quantity than is often supposed. It becomes one among many identities of preferential ownership. Property is the object of ownership from which all other aspects arise in using it by the owner. Foundation of social contract is property. And its first condition that everyone should be maintained in the peaceful possession of what belongs to him. There could be many activities that could cause destruction and damage to geoproerty. Such activities could be of grave concern to the ownership rights of that property.

²⁷ “Sovereignty”. <https://en.wikipedia.org/wiki/Sovereignty>. Accessed 27 November 2019.

law,²⁸ state sovereignty is essentially considered a negative concept. It is the jurisdiction of the state that matters as its positive complement.²⁹

8.6 So, What Is Law?

Humans “feel” or rather have decided themselves without any consultation especially with other life forms that they have an “inherent right” to their own lives and all things associated with them. They do not agree with such rights for other living things. Here they conveniently take advantage of the argument that other living things are meant for humans to survive under their inherent rights or are disposable. Are not humans disposable? May be, or maybe not. Perhaps humans are right. But that is not the case under argument here. The argument is that if humans have a fundamental or inherent right to their own lives, how does that right compare with that of another human? If it is the same, then why not that of other life forms? If that is so, how is the argument that all humans have right to his or her life valid? Would not it clash with others?

Assuming there is individual right that is inherent in a human to life, the source of this right, whatever it may be, is what a government will naturally respect. This respect leads to protection of life and property as a duty of the government. Protection of life is not prevention or pre-emption of death, but provision of well-being till death. This right to life comprises every factor including liberty, freedom, property, privacy and what not that figures in the definition of life. The primary condition is that one person’s right to live should not interfere with that of another. This is more an understanding than a terminal contract or something similar between them. That is where law enters.

In a human system, law is a code of (expected to be) well thought out and accepted procedures of conduct with absolute *consensus ad idem* of all members of the system, also expected to affirm by those who will be part of that system subsequently, made with the sole intention of regulating behaviour of its members for the good order and discipline of the system leading to considered benefits, convenience and existential well-being of all in the system under the right to live by the due process of governance without prejudice to the rule of law (Yes, quite long; by author).

Law is made by a member or a group of members of the society competent for making it. God does not make law; humans make, even in god’s name. That is allowed and very much within the order of law making. The law gets frozen once made. The intention behind making law is the well-being of the people of the identified system under the principles of equity and equality with no one being

²⁸ Customary law is the law based on the long established customs, standards and practices of the localised community that the general law considers a lawful practice.

²⁹ Schwarzenberger, G. (2000). *International law*. Universal Law Publishing Co. Pvt. Ltd. p. 90.

above it. This dictum is universally accepted. The law has to withstand time, not the test of time, at least for the period it has been made. Though the law is expected to be firm, steady, valid and time compatible, it may have provisions for amendments to adjust with the fallibility of human foresight under limitations. There are reasons for amendment: (1) limitations of the vision of the law makers about the future and (2) urgency of the nature of the law being made that makes them forsake many other issues in the thought process. There are many laws that are revoked. They are bad examples of law making and indicative of confusion in governance prevailing at that time if they are not created with the intention of revoking after a lapse of time. There are also many laws that have outlived their times. However, the governments may not revoke them following the typical human behaviour of sliding the trash under the carpet or the feeling of garbage reluctance in case it turns out to be useful later (which makes trash a collectors' item) in the normal life. With all these comments, it may be understood that it is difficult to make law that is the best for all and perfect and will withstand time in the normal life span of generations of humans in a go.

Law is necessary for the community to enforce rule of law. Law is enforced when it is violated by interested parties for their convenience. Anarchy persists when there is no law or the existing law is not enforced. Law and violation of law are from the ancient mould. But with the advancement of society, the unlawful activities related to it also changed and transformed.

8.7 Rule of Law

It is generally accepted and also advocated that there is no single recipe for rule of law. The idea of the rule of law encompasses a mixture of ethical and political principles. Rule of law and due process of law are often attested as the basis of democratic practice in governance. However, the studies in national security are not singled out for electoral democratic systems alone. They are applicable to any form of government, the system does not matter. National security demands standardised application of governance from any form of government, assuming all governments want to rule sustainably, without losing hold over the nation and the people. One of the conditions for that is to carry the people with it by whatever means. Only the style of governance will be different. All governments, whether ancient or present, involve people. The people need not be all supportive of the government. All governments aim to balance the system in a state better than in its absence. The system will otherwise drift. Governments steer them. Therefore, the rule of law is part of governmental intervention. The methodology may change and will be as approved by the laws the government has made.

Rule of law means everyone follows the law. To establish rule of law, it is essential that no one acts arbitrarily or unilaterally, however powerful he or she may be, outside the law. Everyone is equal before the law. Rule of law is not inconsistent with authority. It is, however, inconsistent with the arbitrary use of authority. That is a supposition. It is impossible to match it in practice because of

human behavioural vacillations, though possible while making law. That is not sufficient; the governments will have to exercise their powers of enforcement in accordance with well-established and clearly written rules, regulations and legal principles. The companion to the rule of law is “due process” which ensures fairness in all legal matters, both civil and criminal in the fields of enforcement, especially in courts. This too depends upon the practical approach of the government in power towards rule of law.

One of the dictionary meanings of the rule of law is “the restriction of the arbitrary exercise of power by subordinating it to well-defined and well-established laws”. The prime requirement in this definition is well-defined and well-established. The law can be well-defined and made durable for prolonged time at the time of making it. The law gets frozen the moment it is made. That is why durability is necessary and should be dovetailed in it at the time of drafting itself. Durability means the ability of law to meet the requirement of timely variations in social situation. Establishing the law is a task of enforcement and adjudication. It takes time. Establishing a law is also a test for its definition.

The Oxford English Dictionary amplifies rule of law further: “the authority and influence of law in society, especially when viewed as a constraint on individual and institutional behavior; (hence) the principle whereby all members of a society (including those in government) are considered equally subject to publicly disclosed legal codes and processes”.³⁰ The term is closely related to constitutionalism and similar models adopted by different countries in governance and refers to a political situation, not to any specific legal rule. The prime take away in this definition is that rule of law is not a legal stasis but a political situation. Alternatively, it is a factor of governance. Hence, rule of law in a country will depend upon the policies, procedures and methods of governance adopted by the concerned government. Ultimately, rule of law means there is no one exception to law including those who deal with it.

Outside the dictionary meanings, according to the World Justice Project (WJP), rule of law is a durable system of laws, institutions, norms and community commitment that delivers accountability, just laws, open government and accessible justice as follows:³¹

- (1) The government and the private actors are accountable under the law.
- (2) The laws are clear, publicised and stable. They are applied evenly. They protect fundamental rights, including the security of persons and contract, property and human rights.
- (3) The processes by which the laws are enacted, administered and enforced are accessible, fair and efficient.

³⁰Wikipedia. “Rule of Law”. https://en.wikipedia.org/wiki/Rule_of_law. Accessed 3 April 2020.

³¹World Justice Project. “What is the rule of law?” <https://worldjusticeproject.org/about-us/overview/what-rule-law>. Accessed 3 April 2020.

- (4) Justice is delivered timely by competent, ethical and independent representatives and neutrals that are accessible, have adequate resources and reflect the makeup of the communities they serve.

The WJP considers them as the four universal principles of rule of law. It further develops the cardinal principles into nine factors to form the annual index. The Annual WJP Rule of Law Index (RLI) carries out extensive and exhaustive survey among experts and households to understand how the people worldwide experience rule of law. The index is quoted in almost all countries worldwide. The factors are as follows:

1. Factor #1. Constraints of Government Powers

Factor 1 measures how the law applies to those who govern. This indirectly measures the means by which the government, its officials and agents are limited by the law and how the law applies to them. “Are the beyond the law” is the question. Their accountability under the law is strictly measured. It includes checks on government’s power, freedom of press and free speech and so on. The AR&A balance in governance is the sole issue. Chances of abuse of power, absence of checks by the legislature, the judiciary and independent auditing and review agencies, provisions and effectiveness of media and civil society monitoring government activities and accountability of officials to society are checked. The extent of application of law in the transition of power is another aspect of scrutiny. In general, every possible abuse and misconduct by government, officials and other agents of government are examined to understand the constraints of powers of government. This factor addresses the effectiveness of the institutional checks on government power by (1) the legislature, (2) the judiciary and (3) independent auditing and review agencies; (4) government officials are sanctioned for misconduct and (5) government powers are subject to non-governmental checks, (6) the extent to which transitions of power occur in accordance with the law.

2. Factor #2. Absence of Corruption

Corruption is assured reality in human behaviour patterns governed by the feeling of deficit. It is an example of how people turn to their own well-being in the perceived absence or insufficiency of governance yield. It applies to people who have the power to abuse it. In fact, the more power the people have, the higher the tendency to abuse it corruptibly. Factor 2 of RLI measures the absence of corruption in government in three forms. They are bribery, improper influence by public or private interests and misappropriation of public funds or other resources. The WJP examines the three forms of corruption with respect to (1) government officials, (2) the judiciary, (3) the military and the police and (4) the legislature.

3. Factor #3. Open Government

Factor 3 measures open government. WJP defines open government as a government that shares information, empowers people with tools to hold government accountable and fosters citizen participation in public policy deliberations. This is more in terms of the elements of informational security and how the

government handles information dissemination. The measures are (1) how the government publicise laws related to information, legal rights of people to information, quality of information, etc., (2) handling of requests for information and (3) the effectiveness of civic participation mechanisms—including the protection of freedoms of opinion and expression, assembly and association and the right to petition and whether people can bring specific complaints to the government.

4. Factor #4. Fundamental Rights

Factor 4 measures the protection of fundamental human rights. It considers a system of positive law that fails to respect the core human rights established under international law is at best “rule by law” and not “rule of law”. Among the established human rights, those that are close to rule of law system are considered. They are (1) equal treatment and absence of discrimination, (2) the right to life and security of the person, (3) due process of law and the rights of the accused, (4) freedom of opinion and expression, (5) freedom of belief and religion, (6) right to privacy, (7) freedom of assembly and association and (8) fundamental labour rights, including the right to collective bargaining, the prohibition of forced child labour and the elimination of discrimination.

5. Factor #5 Order and Security

Factor 5 measures the way security of persons and property are assured. Law is to provide security to people. State is responsible for the security of people and property. This factor includes (1) crime, (2) political violence and civil conflicts and (3) redressal of personal grievances without people resorting to violence, which is otherwise known as vigilante justice.

6. Factor #6. Regulatory Enforcement

Factor 6 is about the measure of how effectively the laws are enforced. Care is taken to see whether they are enforced without undue influence or private interests. The measures are (1) effective enforcement, (2) impartial enforcement, (3) timely conduct of administrative procedures, (4) following due process and (5) no expropriation of private property without adequate compensation. This factor focuses on how regulations are implemented and enforced.

7. Factor #7. Civil Justice

Factor 7 measures how a citizen can resolve grievances peacefully and effectively through the civil justice system. The measures are (1) access and affordability, (2) free of discrimination, (3) free of corruption, (4) free of influence by public officials, (5) timely court procedures, (6) effective disposal of civil justice and (7) accessibility, impartiality and effectiveness of alternative dispute resolution (ADR) mechanisms

8. Factor #8. Criminal Justice

Factor 8 evaluates the criminal justice system for its effectiveness. It measures (1) capability of investigating criminal offences, (2) capability of adjudicating criminal offenses, (3) effectiveness of correctional system, (4) impartiality and non-discriminatory, (5) corruption (6) improper influence and (7) protection of rights of the victims and accused. It covers the entire system: police, lawyers, prosecutors, judges and prison officers.

9. Factor #9. Informal Justice

Factor 9 concerns the role played in many countries by customary and “informal” systems of justice. This includes traditional, tribal and religious courts, community-based systems, etc. in resolving disputes. These systems, according to WJP, often play a large role in cultures in which formal legal institutions fail to provide effective remedies for large segments of the population, or when formal institutions are perceived as remote, corrupt or ineffective. The concepts that are covered under this factor are (1) whether timely and effective, (2) whether impartial and free of improper influence and (3) the extent to which fundamental rights are respected and protected. This factor is not included in the WJP RLI because of the complexity in measuring the concepts. However, WPJ carries out studies where possible. It is a challenging activity for WJP.

An examination will show it is impossible to have any hard and fast rule in establishing rule of law as idealism can play havoc in determining and framing opinions in rule of law. A suggested method is to allow freedom of opinion to people to comment on rule of law without making effort to overcome barriers if they are too hard and not worth breaking.

Establishing rule of law is an unremitting activity of the government. Effective rule of law requires support of the constitution, law making as per the constitution, enforcing and adjudication without violation of people’s rights and abuse of power. Rule of law is an imperative of national security; it is not an element. It also is a challenge to executive authority and decision making in governance. Rule of law applies to every aspect of governance domestically as well as internationally. The subject is important not only in every aspect of the identified elements of national security but also in all the terrains where the game is played. This is where one has to see the seriousness of due process in the rule of law and the associated principles.

Rule of law has to consider not only the domestic scenario but also the position of the country in the world and accordingly its sovereignty as well as international engagements and participation in collective security and other factors. The nation will be affected by the global process, especially in handling unlawful activities that are transnational in nature (Box 8.6).

Box 8.6 So, Ultimately, What Is Rule of Law?

Rule of law is considered to be the restriction of the arbitrary exercise of power by subordinating it to well-defined and established laws domestically with due consideration to international law. If this statement is not acceptable one may try this, “Rule of law is the way individuals in a human system are made to behave balancing singularity with differentiability in an individual human superimposing the group behaviour”. It is unlikely a government accepts the latter.

8.7.1 *Sovereignty, Citizens, and International Relations*

Sovereignty means complete authority and freedom to rule and exercise authority over ones nation internal as well as external to its interests subject to international law. It is a political concept meaning the right of a government to have control over its entire area. A sovereign government is the only law maker of the land and other terrains associated with it under sovereignty as per the international law. Sovereignty authorises full right and power to a governing body over itself, without any external interference. In political theory, sovereignty is a substantive term designating supreme authority over some polity. In international law, sovereignty is the exercise of power by a state. It means omnipotence (all powerfulness) in the unitary state's concept. The state is said to be all powerful within its limits. However, in reality, omnipotence can skid many miles unless mutually appreciated by the members of a group of sovereign states. Each state is expected to accept it in reciprocity in the group of nations.

Sovereignty originated from the land domain is applicable to all the terrain dimensions of the nation under national security. Being the core attribute of the modern state, sovereignty is involved in everything the nation does in maximising its national security. It has a two-pronged characteristic: one drawing onto its citizens and the other interactive with other nations of the world. Both are live without a break. The government needs to understand the continuity in establishing rule of law—domestic as well as international.

The idea of sovereignty emerged as the European model in 1648. The international face was not established then. It was more about the sovereignty effects on the citizens. The citizen's relationship with political authority changed and took a turn for the better with the concept of sovereignty. Sovereignty reconceptualised the relationship between the state and the citizens and the citizens and the state. Yes there are differences. It can be visualised and exemplified from the triad of the rule of law (Fig. 8.1).

As political scenarios change with the advancement of time (more than three centuries now), the concept of sovereignty too gets reassessed by governments, judicial systems and citizen opinions. This in turn impacts the rule of law in national and global scenarios. Governments find the issues cuddle up under contingent situations of governance. Government decisions under intricate situations get questioned frequently by citizens and their representatives. International relations too get swayed under determinants of sovereignty. All these bring about conceptual changes in sovereignty.

The modern state faces too many challenges. The challenges and their handling by the government can impact international dealings as well as state-citizen relationships based on sovereignty. There are many rise of the terrorist groups, organised crimes, pandemic lockdowns and internal and external aggressive groups. . . There are many a state will know. How do they affect the sovereignty of the state? Can a government take action against threats by violating sovereignty in the process of establishing rule of law?

There were mentions of the law of limitations. In addition, the nations may have to put limitations on national security governance while engaging some of the threats under sovereign considerations. An example is an operation in a foreign country without the knowledge of that country and its people to pre-emptively destroy the targets that will turn out to be the threats to one's own country. What about war, laws of war, militarisation and sovereignty? What about terrain specificity and sovereignty, say, in cyberspace or genomic space?

Extraterritorial jurisdiction for a country is based on the five principles of international law:

- (1) The objective of territorial principle—offence occurs in one country but has effects on another.
- (2) The nationality principle—offender is a citizen of the prosecuting state.
- (3) The protective principle—offense threatens the vital interests of the prosecuting state (acts of terror is included in this principle).
- (4) The passive personality principle—victim is a citizen of the prosecuting state.
- (5) The universality principle—it is where the offense is universally condemned by the international society normally by a multinational convention or treaty.

These five principles follow decision making when a government has to establish law across its borders or domestically on matters global.

As mentioned earlier, sovereignty is of land origin. It has a lot to do with the landclasp syndrome of humans. Sovereignty is the supreme authority within a territory, where the territory is the geopolitical entity in this case. Sovereignty permits the entity to establish law or change an existing law. However, when the terrain changes, it can face certain deviations from the normal. An example is the ocean terrain. Sovereignty out at sea seems to have a bit of cleavage showing. The main question is the sovereign rights of a nation in the territorial sea or archipelagic and other waters where there is freedom of innocent passage for responsible vessels on responsible passage. This is not similar to innocent passage of vessels in internal waters. There is an obvious difference that is noticeable in terms of sovereignty. Vessels have right of innocent passage through the territorial sea of another country. In such cases, the freedom of innocent passage changes the right to sovereignty of the coastal state to the right of sovereignty. This is debatable, though. This becomes a major issue in matters of suppression of unlawful activities at sea for the coastal state, especially those related to human trafficking and smuggling. It is a serious matter in most of the waters around the world and the nations associated with them. However, an interesting paradigm of sovereignty is that there should be consensus *ad idem* of other parties in the global perspective.

8.8 Due Process of Law

Governments need to follow due process of law while establishing rule of law. To that extent, it is the legal requirement that the government has to respect in terms of rights it owes to an individual, group or another state. It is protective to the individual status of a person, group and state. Generally, due process is about private rights. However, in the modern times, responsibility of a state demands dealing with an entity with due respect to its concerns about its rights. That is the reason why this study has included the group and another state as entities because enforcement of law will involve not only individuals but also others with individual rights. Otherwise, the accepted definition of due process goes as a course of legal proceedings according to rules and principles that have been established in a system of jurisprudence for the enforcement and protection of private rights. In each case, due process contemplates an exercise of the powers of government as the law permits and sanctions, under recognised safeguards for the protection of individual rights. This study takes home the term individual rights also to all entities including a corporation that stands alone with regard to law in adjudication as part of enforcement.

Due process in law normally comes out as a constitutional clause. Thus due process amplifies the procedural sanctity of the constitution or appropriate document of the nation which is the supreme authority for governance. Every procedure of governance thereby is subject to the due process as applies in law of the nation in establishing national security.

The presumption of due process originates from the understanding that the law promotes public welfare and is in the legitimate public interest. However, a section of people or group will object to it under extreme anxiety or invoked political or religious motives. Under such circumstances, due process may be termed selective. Here, this study also brings in the factor of acceptance of law. Absolute acceptance of the enacted law or ordinance is an idealistic conjecture. The government may not be able to tide over such ideology expecting absolute concurrence or acceptance by the people for a law. In realistic idealism, partial acceptance and partial authoritative push will be what some other government may prefer. Will this make due process an idealistic expectation? Yes, it can. That is when government seeks judicial scrutiny. There can be agitations and disgruntled opinions when a law threatens ideological balance in a system specific to groups or human systems. Governments will have to overcome them for the overall national security settlement. Law is for all. Hence, due process of law will demand judicial involvement or equality judgement. This in certain legal quarters is termed as compelling interest test. It is also a test for the governments to establish rules of law within a time limit. Every government seeks time limit unless it is for indefinite period based on certain parameters of governance specific to a country. This points out the differences in the application of due process in a country-specific manner though the process is all about legitimacy and respect for individual rights all in all for every country.

The meaning of due process need not be in a standardised format globally. It is based on enactments and procedural legislation evolved over time. It will continue

transforming based on situations and global advancement. However, nothing prevents a government in defining and redefining the process of law. Refinement of law is a sign of advancement. The prime requirement of law is to promote public well-being. That is the objective of national security governance. Hence, law supports governance to balance the apparent and perceived security of people. Every law has to be scrutinised based on the compelling interests in making it. The bottom line of compelling interest in law making is enhancing public well-being by enactment.

8.9 Law Enforcement

After making the law, the government enforces it. The government creates specialised agencies for law enforcement. The main focus is on establishing law and order from the citizens' point of view. Law enforcers may apply force. The thought process on the admissibility of force in law enforcement under the ethico-legal conditions is not advanced yet. However, in general, law enforcement comprises pre-empting, preventing, detecting and investigating unlawful activities.

Law enforcement is more than policing or handling domestic laws. It also involves the laws that are subject to international agreements, laws and treaties the nation is engaged in.

Law enforcement demands strict adherence to rules and procedures. It involves a focus on the letter of the law rather than its spirit. Law enforcement if carried out effectively can ensure public order and discipline. It can eliminate criminal activities in society in as much as it is focused on requiring the members of a community or society to comply with the law or face the consequences. The problem of law enforcement as the sole response to crime, however, is that it is singular in its approach, responding to effects without consideration for causes. This statement originates from the observations of the author based on his career experience.

Policing complements law enforcement by fighting crime through community service and problem solving. Policing is the holistic approach to dealing with crime, taking into account the problems that plague a community and working with the people within that community to solve them. Policing needs cooperation from citizens. Policing cannot succeed without citizen cooperation and understanding. Peoples' participation is an active force in law enforcement and policing. While there may be some overlap between these two concepts, the truth is that the differences run deep. Whereas law enforcement implies compulsory compliance, policing suggests voluntary adherence. Where law enforcement uses the rule of law and the threat of punishment to enforce obedience, policing is intended to deal with behaviours through community relationships and addressing root causes. Some people look at policing as a component of law enforcement or vice versa. What is important here is the government should understand that they are different, not identical. This will help enforce domestic laws and those subject to international laws with clarity of vision.

Law enforcement is required in every element of national security on every terrain where governance is necessary. This attribute again makes rule of law an

activity of national security governance. Appropriate laws govern the activities of law enforcement in country-specific manner. Law enforcement involves intelligence gathering, investigation, chain of custody of evidences, surveillance and patrolling, witness protection programmes and various other activities specific to the government system, law and nature of violation.

One of the roles of the government in law enforcement is make the laws and the systems associated with them enforcement friendly. Enforcement-friendly legislation is a term that explains the correlation between law and enforcement from the perspective of the enforcers. “Enforcement friendly” does not mean supportive or favourable to the enactors, the enforcement agencies or others involved in law enforcement. It applies to the fact that the legislation provides justice in the most and appropriate manner expeditiously, without ambiguity or error of judgment. It means the following five factors in the nation’s law making process, enforcement and adjudication:

- (1) Existence of legislation that clearly depicts the unlawful activities and punitive measures and serves the purpose of deterrence
- (2) Clarity of jurisdiction
- (3) Absence of limitations or constraints in enforcing it under intent (enforceability in the society)
- (4) Expediency of the judicial system
- (5) Resistance to abuse

Every piece of legislation is expected to be aimed towards this objective. Enforcement friendly means maximisation of these factors with respect to the changing times. It has been mentioned that a law gets fixed or frozen at the time it is enacted. However, violations and the *modus operandi* of the violators keep changing in time. Enforcement-friendly legislation gives the desired flexibility to meet changes and challenges. The law should define the unlawful activity in clear terms, with specified jurisdiction. Often, there could be legal layoffs in this regard when a crime cannot be specified beyond doubt or jurisdiction causes ambiguity. The judiciary is wary about such situations because the judicial systems should understand the arguments very clearly and without doubt. The law should be enforceable in the society by acceptance. There are many legal instruments that have to be revoked by governments subsequent to legislation. Under such cases, it is not about non-acceptance by the society that should be a cause of worry, but the standing of the convictions in the past when the law was in force. Do they stand voidable and compensated by the government? It is not so, because there is no retrospection here. It is impossible to consider it. However, such embarrassments to social governance can be avoided if laws are acceptable to the society and are not revoked abruptly. The act of such revocation is an admission of the non-enforcement friendliness of that law for which the government is accountable. There are many such cases in legislations and notifications. A law is at its best when the judicial system can handle it within the minimum time required for it to deliver justice. The common adage “justice delayed is justice denied” is applicable here. Delayed justice can be caused by laws that are not enforcement friendly, not due to the fault of the

courts. Finally, law should be resistant to abuse by the parties on both sides. An enforcement-friendly law is balanced right in the front, visible to all. Enforcement-friendly legislations are the ³²backbones of democratic systems for governance under the rule of law. Preventing marine environmental pollution will call for laws that are enforcement friendly in all respects (as in many other cases).

8.10 Crime, Punishment and National Security

Rule of law has never been as critical for the world as it is when the concern is focused on sustainable development goals (SDG)³³ since 2015. The present century matters for the humans because it is time for ushering in the sapient era (Chap. 25). The next generation and the generations thereafter will suffer absolutely making the system surge backwards beyond the normal. The sustainable development goals of the nations are targeted for the year 2030 under the universal Agenda 2030 of the United Nations in which the world reaffirmed its commitment to the purposes and principles of the UN Charter and international law. The UN took note on the Declaration of the High Level Meeting of the General Assembly on the Rule of Law at National and International Levels.³⁴ Participants were very concerned about the way the global system is moving without visions of future for quality life. Among the various concerns expressed for remediation in the resolution, crime prevention and criminal justice found important positions. Crime is a major concern for the world. Crime prevention is a condition for establishing sustainable development policies. This demands nations should be able to establish rule of law. Citizens face crimes in various forms and shapes in a life that has many variations. Irrespective of these variations, one can confront incidents of crime directly or indirectly at every niche and corner of life for which they depend on the state. No one is free from crimes and its impact on social life since the time human life began. Though it is a part of the rule of law, crime is a matter the governments are seriously engaged in without much success from time immemorial without much success, as taken by this study. This aspect is not examined further as the subject deals marginally with crime and the role of government according to the rule of law.

A crime is committed when there is a violation of law. Crime is an unlawful act, and the performer of such act is termed criminal, as the performer has committed a

³²Based on the findings of this study that human system moves forward in surging movements.

³³The sustainable development goals are a collection of 17 global goals and 169 targets resolved to be a “blueprint to achieve a better and more sustainable future for all”. The SDGs, set in 2015 by the United Nations General Assembly and intended to be achieved by the year 2030, are part of UN Resolution 70/1, the 2030 Agenda.

³⁴United Nations. “The rule of law, crime prevention and criminal justice in the context of the Sustainable Development Goals”. https://www.unodc.org/documents/commissions/CCPCJ/CCPCJ_Sessions/CCPCJ_27/CCPCJ_res2018/GA_Draft_resolution_III.pdf. Accessed 2 April 2020.

criminal offence. There is no universal definition for crime. The act when unlawful with respect to a law, as the society sees it, becomes a crime. Hence, it has to be defined statutorily with respect to the particular law. Crime is defined, categorised into types, broken down into its elements, etc. depending on various thoughts and studies in criminal justice. The law books explain them. Irrespective of the variations in definitions and approaches, there is no doubt that a crime is a commission of an act by one singularly or jointly that is harmful and injurious to another individually or as a group and specially defined, prohibited and punishable under criminal law.

Within all these variations, this book defines a crime as any violation of an existing law or an accepted legal system in a society that is applicable to that society. In fact crime is an “unlawful act” as considered by a human system within that system. To that extend, criminal justice is the outcome of the “act” of adjudication of the criminal act under the rule of law exercise in due process. Criminal justice in a wider sense is the system through which crimes and criminals are identified, apprehended, judged and punished if convicted through law enforcement, judicial courts and corrective measures in that order. The rationale of criminal justice as it stands today is to regulate crimes in the society through application of the three sequential pieces of rule of law governance.

From the perspective of social harmony, an unlawful act or violation of law is a crime; according to seriousness, a crime can also be defined based on the degree of punishments. However, the punishment that is the highest in degree is considered to be execution of the condemned. It is a complex subject in human behavioural aspects, but a punishment awarded since yore. In most of the cases, the executioner also feels himself or herself the judge. On the other side, an execution is also considered a crime and interestingly a universally acceptable practice in war and security interventions and religious conflicts which is eligible for awards as well as accolades depending upon the perception, actual or virtual.

Colin Wilson (1931–2013), the British writer, philosopher and novelist who also wrote on true crime, mysticism, paranormal and similar topics, wrote exhaustively about what this author would like to call the “affinity” of humans to crime through various periods. Wilson’s book *A Criminal History of Mankind* ³⁵ is descriptive about not only crimes people committed but also the way the world carried it along progressively. The book makes an interesting study that may perhaps need an exhaustive research to compare the crimes narrated with respect to the rule of law and governance prevailed during the period.

Governments of the world were never capable of handling crimes and establishing rule of law so far, aimed at citizen well-being. They remain unsuccessful today also, and in all likelihood, they will fail in the future too. The perennial visualisation of a thief running ahead of a cop will show the distance between crime and law enforcement. Law and enforcement if not ahead should be at least in par with crimes to establish rule of law by governments. There are limitations to

³⁵ Wilson, C.H. (1984). *A criminal history of mankind*. Granada Publishing Limited.

it. Understanding the bottleneck and accepting the reality of limitations is the first step in governing to establish rule of law.

8.10.1 *Universal Crimes*

The term universal crime is a misnomer unless it is considered meaning crimes against humanity which nations can try under universal jurisdiction. The idea of universal crime needs to be approached for examination empirically and normatively. It can go beyond the boundaries of a nation as well as remain within. The attempt will also heave the international community to the difficult topic of universal justice. It is a foggy subject though a lot of actions have been taken by governments in the name of universal justice which the system antagonists may find and conclude as universal crimes in a different sense—crimes by governments and mass faith. Protagonists and antagonists are relative entities in a system that naturally comprises people with likes and dislikes. In India, it is said that a particular political leader had barred his party supporters from donating blood to the country's soldiers in the middle of a war that the country was subjected to by deception.³⁶ Human systems are naturally polarised in the aspect of rule of law. But generally, humans need and want to be governed under rule of law that will maintain well-being under governance. Hence, universal crimes according to this study are those affecting humanity irrespective of where the crime is committed. However, as with all the crimes, the very nature of the phenomenon and any intellectual inquiry into it are normative

³⁶ Philip, S. "During China war, comrades cracked down on VS for saying let us give blood to Indian soldiers (*jawans*)". According to the article then undivided Communist Party of India (CPI) supported China when it attacked India in 1962. The war lasted a month (20 October 1962—21 November 1962). Comrade V.S. Achuthanandan, then 39 and central communist party member told his party members to donate blood to Indian *jawans* and contribute money to the much haggard and confused prime minister, Nehru's defence kitty as other citizens were doing. But the comrade came under flak from other comrades of the party especially the senior leaders of the party comrades Jyoti Basu (1914–2010), E.M. Sankaran Namboodiripad (1909–1998) and K.P.R. Gopalan (1909–1997). The proposal to donate blood and money for the nation's defence was immediately rejected first by comrade O.J. Joseph who clashed with Achuthanandan the next day when the latter re-mooted the proposal. The octogenarian V.S. Achuthanandan was finally sacked from the party politburo on 13 July 2009 for alleged indiscipline. Interestingly, the octogenarian now 98, in his autobiography in Malayalam titled *VSinte atmarekha* being published by Current Books (2021), has reportedly deplored about an assassination of a rebel leader who floated a separate party still under communist ideology on difference of opinion with the regular senior leaders of the party, now Communist Party of India, (Marxist) (CPI (M)). The slain leader T.P. Chandrasekharan (1960–2012) was hacked to death by assassins allegedly hired by the party, who was ruling the state, under orders of the senior leaders near his house in Onchiyam on 4 May 2012. His body had 51 slashes purportedly made by *koduvals*, a local sharp and long chopper knife. His brutal murder was lamented by VS Achuthanandan stating *How people could do such heinous acts?* Such incidents are interesting in the case studies on the convolution of human demeanour and intellectual maturity. Thomas, J. *Ingane vettinurukkan engine kazhiyum?* Malayala Maonrama, Kozhikode. p.1.

matters, and the questions as to whether humans either have or should have universal justice cannot be regarded as separate issues. It also depends upon what the people approve as crime and justice.

In international politico-legal terms, universal justice and universal crimes are equated with the definitions found in the international instruments providing procedures for judging and sanctions against specifically delineated “core international crimes”. They are expressed in different terms such as war crimes, genocide, crimes against humanity and so on. Logically, universal justice then becomes the reaction of the international community through ad hoc tribunals or the International Criminal Court (ICC), or the incorporation of such international definitions into national criminal law and procedure according to the universality principle of jurisdiction. In law, an act becomes a punishable offence or crime only when a law makes it inviolable. The criminal title and punishment should be clear through a law.

A mention has been made about transnational organised crimes (T-NOC) in an earlier chapter. It is a universal crime in the literary sense. However, in international criminal law theory, there is a conceptual divide between international crimes mentioned here *stricto sensu* (genocide, crimes against humanity, war crimes, aggression) and T-NOC.

For the study of national security which is a nation’s business with due concern to others in the globe, universal crimes are those that are committed against humanity whether within a nation or across nations. It is for the concerned government to decide within the available decision framework giving allowance to legal frameworks. This study terms T-NOCs also as universal crimes for the reason that they cause virtual damage to unsuspecting citizens of the world. It also shows the UN has reasons to be accountable in handling and regulating universal crimes.

This study therefore defines universal crimes as those crimes against humanity that could be handled by any nation irrespective of spatial jurisdiction by prosecution or adjudication as decided by the nation under national or international laws or both for damages caused to humanity irrespective of nationality for criminal activities of universal nature (as needs to be defined) that include at least the following:

- (1) Aggression
- (2) War crimes
- (3) Genocide
- (4) Extermination
- (5) Arms trafficking
- (6) Narcotic drug and psychotropic substances trafficking
- (7) Human trafficking
- (8) Organ trafficking
- (9) Murder and assassinations
- (10) Environmental violation
- (11) Enslavement
- (12) Attacks on or related to faith
- (13) Imprisonment
- (14) Physical and mental torture

- (15) Rape and sexual violence
- (16) Forced abortions
- (17) Forced religious conversions
- (18) Planned religious conversions
- (19) Planned transfer of natural citizens to the demographic disadvantage of other nations
- (20) Subversive funding to damage human system well-being elsewhere
- (21) Sexual violence
- (22) Persecution
- (23) Hostage taking
- (24) Forcible transfer of natural citizens
- (25) Apartheid
- (26) Act of piracy, armed robbery and banditry at sea
- (27) Aiding pandemics by any means

The list above is only suggestive and basically to draw the attention of governments to the international issues related to rule of law within own nations.

8.10.2 *Capital Crimes*

A capital crime carries the possibility of death sentence and execution by the state. Normally, in the course of law, crimes that carried death sentences were murder, treason, espionage, terrorism, drug trafficking, rape, sedition, piracy, aircraft hijacking, etc. depending on the domestic laws of the country concerned. They are normally decided in bifurcated trials.

Lately, there are discussions on capital crimes and punishments based on the question of disposability of humans by humans. This is a matter that the nation has to decide with respect to its form of governance under the circumstances that are exclusive to it. While the national security concept is uniformly formatted towards the well-being of people, the circumstances under which it has to be executed by national governments will be different and known to the respective nations better. Therefore, capital crimes may be treated exclusively by the nation that is affected. Abolition of capital punishments therefore is a nation's prerogative, but it has to be subject to international law, not opinion. There are two different opinions on capital punishments. For those who object, it is an instrument of imperfect justice where one does not have the power to dispose another human. However, if it happens to be a punishment for a human who disposed another or is likely to do so if continued, then it is matter of different argument—punishment for disposing off a human intentionally or with the knowledge of it that being an inhuman act and hence the one who committed it is not human in personality and conduct. Those who argue for capital punishment has clear understanding of it and may be judgmentally correct if necessary procedures are followed prior to execution (Box 8.7).

Box 8.7 Hanging the Man on the Wheel Chair

Authorities in Pakistan faced an embarrassing decision situation when they had to hang a person seated in wheelchair. The convict sentenced to death by hanging for murder in 2009 became a paraplegic after a bout of tuberculosis. There was opposition from human rights associations and certain lawyers on the capital punishment. The argument was on the prison violating its own regulation that the condemned should be able to mount and stand on the scaffold by himself.³⁷ It was first of a kin in Pakistan but not without precedence in other part of the world.³⁸

8.10.3 Punishment and Rule of Law

Fyodor Dostoevsky's corporeal novel Crime and punishment³⁹ is about the moral dilemma and associated mental anguish suffered by his fictitious young character Rodion Romanovich Raskolnikov, who alludes to kill an unscrupulous (according to him) pawn broker for her money. He was desperate. He rationalises his planned action in her assumed dishonesty as pawn brokers were normally thought about (wily and deceitful) and his consolation that he would be able to elevate his status and make money to help others. However, that was not the way he felt after committing his deed and had to confront the reality of his act in the real-life environment.

The interesting part of the book for the author is that the protagonist was a dropout from the law school. He punished the pawn broker who was very much weaker than him in physique on at least two counts—age and gender. The reasons were judgmental and not legal—being rich and corrupt. There was pre-rationalising that needed directive pre-counselling.⁴⁰ The story reflects an example of nihilism that destruction of the present (and past) is necessary to build a better future.

³⁷The jail handbook read, "The condemned prisoner shall mount the scaffold and shall be placed directly under the beam to which the rope is attached, the warders still holding him by the arms".

³⁸John Hall. "Pakistan plans to execute a severely disabled man by hanging him to death while he remains seated in his wheelchair". 22 August 2015. <https://www.dailymail.co.uk/news/article-3204936/Pakistan-plans-execute-severely-disabled-man-hanging-death-remains-seated-wheelchair.html>. Accessed 18 July 2019.

³⁹Fyodor Dostoevsky (1956). *Crime and punishment*. Random Press. (Translated by Constance Garnett).

⁴⁰The author recommended pre-counseling of prospective seagoing personnel who may likely fall victims of pirate attacks and subsequent hostage taking for ransom in an international conference held in Karachi, Pakistan in February-March 2012. It was author's finding based on humanitarian rights of pirate victims. Prabhakaran Paleri. (2012). "Piracy victims: the Indian experience", in David N. Griffiths. (Ed.). (2012). *The human face of marine piracy: consequences and policy options*. Proceedings of a conference, Karachi. Fazaldad human rights institute, Islamabad, Pakistan.

Raskolnikov did not want forgiveness. He yearned for redemption through confession of his crime to a poor prostitute. She symbolised hope for him. Is punishment a mental game within self or an external attribute society gives? What if the guilty does not accept it?

One of the definitions of punishment is “some pain or penalty warranted by law, inflicted on a person for the omission of the performance of an act required by law”. The punishment is ingrained in the law where crime is descriptive like a product on sale in a superstore. Punishment is tagged on the crime. People may buy the product looking at the price tag. Can people also commit crimes looking at the punishment tagged to it? This was a question the author confronted with whenever he had to punish somebody for some wrong doing leading to violation of a definite law. The answer is still playing hooky with the author.

If punishment is inducing “some pain...” in another whoever he or she may be, is that not also a violation? Of course, it cannot be unless there is law preventing award of punishment for a crime. It is not possible because law is not only about crime but also punishment. Punishment, therefore, is a mirror image of crime and not external to it. One of the reasons why the author is so fixated with punishment is that the present reasons given for punishment seem to be at odds with natural justice (mentioned earlier) more so with respect to national security governance, especially if it is about maintaining law and order for enforcing law.

In the common knowledge, punishments are justified under certain veiled statements of justification by rationalisation a la Raskolnikov. Humans face many limitations in justifying acts. Some of them include the following:

- (1) **Deterrence.** Deterrence is at the top of justification, especially in certain quarters such as armed forces. If that is so, in spite of punishments being meted since primitive periods under equally primitive governance that too in the most inhuman ways,⁴¹ the acts of violation of law in the social systems still continue. It is a paradox that nullifies the reason of deterrence as an argument for violation of law. It emphasises punishment is a mere tag without which crime as a term cannot sustain in human belief system. It is an uncontrollable response to the undesired. Interestingly, there are many human systems where extremely brutal punishments still persist and meted out in the most primitive ways. Yes, it is not only a shame to the advanced societies but also justifies the unitary civilisation and the worm tunnel rack where people stand at different position as humans one behind the other irrespective of what their status is in the make-believe societies. Today punishments do not match the desired social etiquette of modern times. Specific punishment deters a prospective violator from committing an unlawful act is acceptable to certain people who even otherwise may not commit them. However, habitual and situational offenders and those who make a living through crimes cannot be deterred by punishments. This is also applicable to

⁴¹ A walk through the London Dungeon or any museum of ancient punishment techniques will show how inhuman were humans and still unsuccessful in preventing unlawful acts.

those who violate laws unknowingly or by chance. In deterrent mode, punishment is supposed to frighten the prospective violator.

- (2) **Incapacitation.** Incapacitation is removing a defendant from society under the expectation that crime will be prevented.
- (3) **Retribution.** Punishments to a crime provide retribution to society as if justice is done under the “we want justice” cry where justice is not defined. The people will also comment the justice was under or over their expectation causing a retribution deficit or surplus. Both ways retribution matters in awarding punishments in a measure that is relative to the third parties associated with the unlawful act.
- (4) **Rehabilitation and restoration.** Rehabilitation and restoration of an offender generally gives a Good Samaritan outlook towards behaviour modification for the better, but may not serve the need as human personalities are not easily changeable especially by external helps.

In establishing rule of law, punishments are demands of responding to an act under justification. Awarding a punishment for a crime is similar to mitigating a disaster. It will not establish status quo ante for a relook by the prospective accused. Often it does not happen, and punishments end up as a natural response but without which there is a feeling of an unpunished act. This is the paradox of rule of law.

From the point of view of national security, rule of law can be seen as expenditure-centred activity for the government. Establishing rule of law is a costly affair. The cost can impact developmental activities. Therefore, the government may see punishments as an avoidable response which becomes practical only by preventing or pre-empting crime. This can be done by looking at the crime not the criminal as a threat. In a preventive and pre-emptive rule of law regime, the cost of governance can be brought down to the minimum by not having to meet out cost of punishments besides rehabilitation and restoration of prospective criminals. There are various other sociopolitical advantages in creating a crime-free society. This is possible under good governance by pre-counselling the potential violators of law. These are not idealist statements. They reflect idealistic realism within pragmatic reflection if governments take care to study and enforce law.

8.10.4 Is Rule of Law Possible?

Rule of law is an activity. Every activity is possible. Therefore, the role of government is to establish it by modern governance methods according to the period and the standard of the human system in the unitary civilisation. Rule of law incurs cost. Therefore, the cost-benefit assessment is a decision factor in establishing rule of law. There are innovative ways the governments can improve the cost-benefit returns. It is not a serious question of ethics or morality. More important is the governing cost. Overflowing jails, delayed adjudication, corrupt practices, political involvement and obstructions, etc. can increase cost of rule of law.

There are many methods by which the cost of rule of law can be brought down. One of them is using the criminals for positive returns without violation of human dignity. It is not rehabilitation but transformation of the anteforce to national demographic dividend as a worthy the reward. This is a specialised task for the government.

Rule of law is applicable to government and the people. There are systems where the rules may not be applicable to certain people within the country. These are systems that are still backward in governance. It is only a matter of time when they come under rule of law. In India, there is a judgment in which the Supreme Court has declared that the rule of law is an essential part of the basic structure of the constitution and as such cannot be amended by any Act of Parliament. This shows the superiority of law over all other authorities.⁴²

Rule of law is possible to establish if the ground rule of the law is understood. *The concept of Rule of Law is that the state is governed, not by the ruler or the nominated representatives of the people but by the law. The Constitution of India is intended for India to be a country governed by the rule of law. It provides that the constitution shall be the supreme power in the land, and the legislative and the executive derive their authority from the constitution. The paper begins by providing an introduction to Dicey's⁴³ three pillars on what a government must be based and how the Indian Constitution fulfills these three requirements. Later, it discusses the theoretical and practical application of this rule of law in India. The king is not the law, but the law is the king. In national security governance, the king is the provider of national security where the king in today's parlance is the government. The government does it under absolute understanding that it has to be under the law that it has to make and enforce. These are signs of advanced form of democracy.*

8.11 Summation

In the beginning, it has been stated that establishing “rule of law” following the “due process of law” is one of the roles of a government. Rule of law is a condition of national security. It is not an element but a function of governance and the role of government. Establishing rule of law requires “enforcement-friendly laws”⁴⁴ and their enforcement. It is for the government to ensure rule of law under the presumption that people can violate law. This will affect the law and order situation in the country and in turn the overall governance towards maximising national security.

⁴² State of Kerala[vii] the Supreme Court held that the

⁴³ According to Albert Venn Dicey (1835-1922), the British Whig Jurist and constitutional theorist popularised the term “rule of law” accentuating three principles: (1) supremacy of law, (2) equality before law and (3) predominance of legal spirit.

⁴⁴ Paleri. P. (2010). *Maritime security: the unlawful dimension*. Magnum Books Private Ltd. p. 8, note 15.

The absence of rule of law or the decline in rule of law indicates a gradient towards anarchic rule by the people without a government or a government that is not heeded to by the people.

Violation of law can be individual or in groups. It happens a short burst or as a regular long time habitual procedure. This happens when people seek individual survival methods when they seek apparent or perceived security for themselves, generally. People may take law into their hands against all the norms and principles of rule of law. Governments have to ensure it does not happen. That is the bottom line of governance under rule of law.

Establishing rule of law thereby becomes an activity of the government within its role of maximising national security for the well-being of the people. The governments can do it. The state has the authority. The term “unlawful” is a relative expression that needs to be seen with respect to valid legal provisions or dicta. Governments may face embarrassing situations in their efforts to enforce law. But a nation should know that it is an all powerful entity when it comes to establishing rule of law. It is more powerful than those who violate the law established by it for good governance. However, government is not law. The hypothesis, here, is that the state has the authority; hence, it can suppress and eliminate an unlawful activity within its jurisdictional limits. The crux of the problem lies in deciding the element of “unlawfulness” of an activity.

Well-being of the people is the ultimate objective of national governance by maximising national security. Rule of law is a critical factor in it. In this process, the concept of rule of law is important (Box 8.8).

Box 8.8 What Is the Concept of Rule of Law?

Rule of law invokes the fact that the state is governed by law, not by any agent or individual. That means there should be law to establish rule of law in a state. This makes the constitution of a country the supreme authority to delegate authority. In this aspect, the three pillars of Dicey explains what a government must be based on for Indian Constitution. Simply put, the King is not the law, but the law is King.

Rule of law is rooted in ancient history. It is highlighted in Kautilya’s *Arthasasthra*, ancient Romans of the first republic and many medieval thinkers and scholars. Rule of law as a phrase can be traced to sixteenth century Britain. The formal origin of the word is attributed to Sir Edward Coke and is derived from French phrase *la principe de legalite* which means the principle of legality. The firm basis for the rule of law theory was expounded by A. V. Dicey, and his theory on the rule of law remains the most popular. Dicey points out the concept that “a government should be based on principles of law” based on the principles of supremacy of law, equality before law and predominance of legal spirit (Box 8.9).

Box 8.9**1. Supremacy of Law**

Law rules overall including those who enforce and administer law. The lawmakers need to give reasons that can be justified under the law while exercising their powers to make and administer the law. Supremacy of law establishes checks and balance in governance.

2. Equality Before the Law

The law should be fair and administered and enforced in a just manner, without any discrimination between people.

3. Pre-dominance of Legal Spirit

The legal spirit invokes the authority of the courts as the enforcers of the rule of law impartially and free from all external influences under absolute freedom.

In modern parlance, rule of law has come to be understood as a system which safeguards against official arbitrariness, prevents anarchy and allows people to plan the legal consequences of their actions. Governing national security through its elements and terrains needs enforcement-friendly laws. One of the major tasks of a government is to make laws. Law making will face serious resistances from interested parties. The resistance to law making is also a sign of freedom in the system.

9.1 Introduction

Military is associated with war. The quote at the beginning is exclusively that of the author. There are reasons for it. However, that is not the larger issue. It is the continuation of military security as an element of national security in the presumed

absence of war in the future. For that one has to understand that military security is about the military and its application in national security (2021). Military will continue as long as national security is a concept of governance and human well-being. Humans will have to know about war and other-than-war situations to understand it. In a continuing study by the author, the idea of war was examined and re-examined, especially from the perspective of human vicissitudes and behavioural aspects. There were many interesting finds that could be decisive in governance. One is that war either by itself or as conflict will continue among humans by default as long as they are on top of the life pyramid.

An earlier quote (2002)¹ of the author was “If there is an antithesis to war, it is war itself”. It still holds ground today. War is an antithesis to itself. War can stop war similar to fire dousing fire. The peacekeeping forces invoke the principle of antithesis in war. A coalition force, approved internationally, can also douse a war by war. The contrast to war is not peace. Terms like “preventing war; saving peace” misinterpret peace according to this statement. Peace is an abstraction, whereas war is real, physical and present. The abstract and imperceptible term, peace, does not find a place if not conjoined with war. It is always mentioned in tandem with war and, therefore, comes to explain a condition in the absence of war. People can definitely feel war, but not peace. If someone says “I am at peace”, he or she could be either in a kind of trance or rationalising without being aware. This is debatable, though. Peace, thereby, is meant to be other-than-war situation. It could be equally conflict ridden.

Opposite to war is not peace.² That is why antithesis of war is war itself. That makes peace a situation other-than-war. Second, conflicts are human; they do not stop. When matured, they brim over as war like the froth from the beer stein. Well, this statement is necessary to accept war with all its grit, gore, froth and grace. Realism has never been truistic naturalism in any other situation of human fallibility than war and military engagements.

But how does one say “War is over” so confidently, that too as a quotation? If a quote, it has to stay in time. The author identifies that war is over. That is one reason. The argument is that the global collective security agency, the United Nations, an afterthought of the League of Nations, not a replacement, finally seems to have some control over wars between nations. It shows the thirst for war is quenching under better sense. There could be reasons other than being adequately war soaked. Someone has applied brake or finished with the prime mover. It is a situational change. In fact, it causes the transformation of war into other forms of conflict. It is behaviour modification by evolution. The world today is in other-than-war situation,

¹Paleri, P. (2002). “The concept of national security and a maritime model for India”. *Doctoral dissertation*, Department of defence and strategic studies, University of Madras, India.

²With apologies to the enigmatic Russian author and war veteran (Crimean War) Count Lev Nikolayevich Tolstoy (1828–1910) who wrote the most exuberant opus that according to him was neither a novel nor a poem or nor a historical chronicle. The contention of the author here is that “but for Tolstoy, and through his book to the world, peace became seemingly opposite to war. That is contented with due respect to one of the great authors of all times.

well almost. The chances are it will continue that way. The second argument is that the world is on the run for sustainability awareness. Many argue that there are economic reasons for it.³ Well, more than awareness it is an imperative for the world to remain sustainable to maintain continuity. Wars actually demand a reset in the involved social system. It is against the sustainability principles. War breaks the forward momentum.

Also, it is important to understand at this point that military security is not everything about war and other-than-war conflicts. That is the first point to take off. But before that, one is required to now a bit more about conflicts between “similar” and “dissimilar” species.

9.1.1 Conflicts: *Sapien* vs. *Non-sapien*

According to Nick Longrich, the erudite British Paleontologist, nine species of human bipeds walked on the planet 300,000 years ago.⁴ They are not there now but for one—the *Homo sapiens-sapiens*. Longrich believes more will be found among the vanished and the vanquished human species:⁵ vanished because they could not survive the onslaughts of life’s natural laws and vanquished because they were really beaten hollow and nonexistent by those species superior to them.⁶ This is the argument that holds water currently. All of them were seemingly wiped out en masse, like the wild buffaloes and thereafter the native Indians in the west coast of America under the supremacy of the gold rush settlers. The cause for the total extinction of the pre-*Homo sapien-sapien* species is not identified forensically. It is a puzzle. There were no natural disasters or alien invasion. Then how did they vanish? If a paleontologist like Longrich asks this question one has to sit up and listen. May be an epiphany will point out to the answer.

An arm chair investigator may agree with Longrich when he says there was an interesting scenario around that time—the arrival of a superior human form evolving

³Ayyadurai, S. “The Deep State is Trying to Hide About CV”. https://www.youtube.com/watch?eature=youtu.be&v=xf-qv9o8nq8&fbclid=IwAR3zbFBxRR5_63rBzAo4912FFpaaKklW7WD8f9Bx8Vj9LAPLnylmEYrVxY&app=desktop. Accessed 6April 2020.

⁴Longrich, N. “Nine Species of Human Once Walked Earth. Now There’s Just One. Did We Kill The Rest?” They were (1) *Homo floresiensis* (Hobbits in Indonesia), (2) *Homo luzonensis* (Philippines), (3) Red deer cave people (China), (4) *Homo erectus* (Indonesia), (5) *Homo naledi* (South Africa), (6) *Homo rhodesiensis* (Central Africa), (7) *Homo denisovans* (Asia), (8) *Homo neanderthalensis* (Euresia), and (9) *Homo sapiens* <https://www.sciencealert.com/did-homo-sapiens-kill-off-all-the-other-humans>. Accessed 12 January 2019.

⁵Scientists believe there were many human species and the first human is difficult to establish. It is also true with the time period. So the history of conflicts has to be seen from the time humans became human which would have been somewhere in the prehistoric period and associated with the use of tools as weapons.

⁶Can this happen to those who done it to them—the *Homo sapiens*? Yes, very much under the law of invariance.

260,000–350,000 years ago in South Africa, onscene. They survive even today. They were the *Homo sapiens-sapiens*. The author regards them as sapiens with due consideration for the advanced period they are in. That is today. The complete extinction of the earlier homo species is suggested to be because of the superiority of *Homo sapiens-sapiens* over them for survival. The *Homo sapiens*, as Longrich says, are quite dangerous species⁷. They have a record of hunting down many animals of the period to extinction and damaging the nature. The homo species were resource starved and security anxious. This reflects in *Homo sapiens-sapiens* too. That is natural in nature. Food and land were mega resources that demanded competitive and non-discriminative elimination without any consideration. Eliminating others was one of the methods of resource security—the ancient process of well-being. Wars and conflicts are hidden in resource security. In this dynamics, people went berserk as they do now in the invariant world and eliminated or extinguished others of their own or close variety since it all began as the era of *Homo sapiens-sapiens* through warring, killing, displacing, cleansing, genocidal perpetrations, terrorism, conflicts, wiping out and every other known methods of extinguishing life in every form. Humans are masters in this art. They cannot stop it on their own. They are the sapiens today, more advanced and more intellectually powerful and perfect in annihilation of life on apparent as well as perceived notions. The evidence lies on how they eliminated competition to be the only human species in the world and remain at the top of life.

Evidences lead to the fact that violence is ancient and continuous. It has to be considering the evolutionary process of *Homo sapiens*. Longrich also concludes that war predates the evolution of humans. Does that exonerate humans from the criminal aptitude and acuity? No, it concludes that there is something natural about it—the killing instinct of the *Homo sapiens-sapiens*. Furthermore, that is different from the way other life forms kill.

Research shows that *Homo sapiens-sapiens* had close contact with Neanderthals. The patterns show war traumas on their excavated skeletons. While Neanderthals had certain advantage over *Homo sapiens-sapiens*, the latter were very much superior in survival physics. They were more advanced species in time with better reach, stamina and intellect. It also shows a generation that comes after can be more advanced in evolution than the previous. This is a key factor in human development. The intellect of *Homo sapiens-sapiens* is visible in their weapons. They had overall military advantage based on their weapons designed more intelligently. More evidences are still required to conclude about the conflicts between *Homo sapiens-sapiens* and their immediate predecessor species, the Neanderthals. It is believed *Homo sapiens-sapiens* also had sex with Neanderthals.⁸ It is no surprise considering the power of sex and the present-day sexual behaviour patterns of sapiens. DNA

⁷Longrich, N. “Nine Species of Human Once Walked Earth. Now There’s Just One. Did We Kill The Rest?” <https://www.sciencealert.com/did-homo-sapiens-kill-off-all-the-other-humans>. Accessed 12 January 2019.

⁸Ibid. In some European people. Showing *Homo sapiens* mated with Neanderthals

never dies; well, it exists tens of thousands of years relative to the life for which it was the exclusive instruction manual.⁹

The sapiens, the new level *Homo sapiens* of the day and forward, as this study considers, may also be carrying Neanderthal genes (Chap. 32). Sex is a force which cannot be suppressed that easily. Humans can succumb to sexual urge even when the ideal “other and opposite sex” is not available. Sexual interactions were not just between *Homo sapiens* and Neanderthals alone. There were other encounters with archaic humans all around. The DNAs speak loud about them. It seems the human species were not just masters of sex but also the lords of interbreeding. It also means, as Longrich puts correctly, the DNA story tells that archaic species disappeared only after sexually encountering the forefathers of the present-day *Homo sapiens*. It speaks a lot about the present-day human system and their outlook towards life.

However, the old theory is more focused on another point. That is more important to paleontologists like Longrich: “Why would the *Homo sapiens* wipe out and drive those, with whom they were ‘supposedly’ intimate to have deep sex, to mass extinction?” He finds the answer in unplanned and abnormal growth in population density by exponential reproduction. One knows in the beginning the world was without condemns. Exponential reproduction can cause a dangerous scenario on a living planet, especially when there is no “assigned” or “heavenly authorised” predator. It is happening with the *Homo sapiens-sapiens*. A time comes in human development when people have to die to preserve resources; they have to be killed if they hang on and wait for nature to kill them. This method has its developed forms in practiced format in the world. One of them, perhaps the most acceptable subconsciously, is conflict brimming over to war which further causes the conflicts of attrition. People destroyed people and took over and reengineered what belonged to them including faith. It is continuing today. Who can stop them to make them lead a life of well-being? Only governments—the organised system of a nation since sovereign concepts dawned over the world. It is very recent compared to the human history that is being narrated so far taking just one paleontologist’s view because the author found it a wholesome statement by an erudite scholar about the forefathers of present-day *Homo sapiens-sapiens* with an embedded message of generating well-being and of repeating the mistakes. Unnoticed by causal readers, it also talks about the story of the future generations lucidly, which of course is not a subject of this study. This study is about national security and governing for human well-being in a pragmatic way.

Is war a part of the hot pot recipe? War is incidental, which this study considers over. But conflict stays, if so conflict and war are human, no other life forms go to war. Military security thus came up when humans were killing to survive. That was natural, because death decides survival.

⁹Bryson, B. (2019). *The Body*. Transworld Publishers. p.6.

9.2 Military Security: Setting

It is mentioned earlier that military security is not all about war, but war is the prime concern of military security since the beginning of the human systems and the idea of their governance. Understanding war, therefore, is necessary to appreciate military security in its right perception. Military security has been considered originally as national security until the concept of the latter changed seriously into a larger facet containing all aspects of human well-being. Besides, it is also quoted in this chapter that “war is over”. The big wars are over, as of now. However, one needs to know about war and conflict from the very beginning of humans on this planet to appreciate military security. That has been long time ago, many ice ages back. Like ice age, war too could come back.

Only humans go to war. Other life forms fight for existence, but do not discern conflict situations. The passage to war is through conflicts. Conflicts are natural to humans. They need to be prevented, pre-empted or mitigated if occurs. All these are called, in the language of the day, conflict or dispute resolution.

War is intense and offensive behaviour within a human system. The purpose of war is considered to be access to resources including geoproperty by territorial domination. However, in the deepest sense, war is much more than that. The author considers it is an obsession of the power seekers that are relatively weak in rightful discrimination.¹⁰ In the context of national security, an invasion that amounts to or leads to war is considered acceptable, if it is done to pre-empt an imminent danger or to ward off an attacker in a defensive exploit. It is debatable, though. Such an act needs the support of the international community. A nation needs to set up and equip a military for this purpose if it considers there is a threat by invasion to its sovereignty and territorial integrity. The capability to go to war is necessary for a nation.

War is governed by the laws of war—the laws that govern the actual conduct of an armed conflict (*jus in bello*). The laws of war do not refer to the rules governing armed conflicts (*jus ad bellum*). These laws are outside the rule of law that supports national security principles. Today, there are nations that have serious problems with proxy wars—wars that defy the laws of war. The laws of war¹¹ are applicable only to those related to declared wars. The military will also be required to handle conflicts other-than-war, acts of violent terrorism and so on. The USA opted for military campaigns against drug trafficking and terrorism. The USA also threatened military action against nuclear ambitions. The applicability of laws of war under such situations could be based on common sense approach, but the powerful will have the final word. There are authors like Ingrid Detter who prefers the term “Law of

¹⁰ Rightful discrimination, also right discrimination, is the ability of a human to use the potential of the intellect to differentiate the right from the wrong (relative) for decision making at a critical juncture. Right discrimination discriminates right from the wrong (relative) in a matured sapient sense.

¹¹ Roberts, A. and Guelff, R. (eds.). (1989). *Documents on the laws of war*. Clarendon Press. p. 1.

War” and not “Laws of War” since the rules are homogeneously applicable to the modern state of war.¹² He defines war as “a sustained struggle of the armed force of certain intensity between groups of certain size, consisting of individuals who are armed, who wear distinctive insignia and who are subject to military discipline under responsible command”.¹³

The history of war is as old as history of *Homo sapiens*. It has been defined and redefined many times. The nature of war kept on changing. Every time it was different. No two wars were similar but for blood and guts. But for these similarities, wars continued differently, each war with its own characteristics, with common factors strewn in. In the early days, it was classified as limited wars in a restricted area and total wars at global level. While the concept of total war is erased slowly since the World War II and formation of the United Nations, limited wars continued in various parts of the world. The fear that a limited war between two nuclear powers may escalate into a full-fledged total nuclear war looms largely in the world today. It is more chest thumbing (remember from whom homo species originated?) to voice frighten the opponent who declines to be frightened outwardly. The author believes the world has outlived that argument—the power of deterrence. Asymmetry between parties has also brought strategic changes in limited wars leading to undeclared wars and other forms of conflict situations in the world. Terrorism is one of the offsprings of human imprudence acquired by emotional weakness.

It is said that nuclear bomb changed the destiny of world wars. This study does not agree. According to this study, the destiny of wars changed more by human awareness and public view points in a developing world than by fear of nuclear bombs. Initially, atom bombs, as they were called arbitrarily, created the fear of proliferation with a forewarning of mutually assured destruction (MAD). This expression is rarely used today in scholarly strategic interactions and dialogues. The grandfather term, atom bomb, became nuclear bomb when people became conscious that it was the nucleus of a heavy atom that played the killer part in these mass murder contraptions. Today, they have a collective name with designated status—nuclear weapons. One day, in the not so near future, they may acquire respectable status, if not divine, when used to save the planet by blowing up the giant rocks that may stream into it from terrain number five, deep space. But how the world will handle it together is not known if the response to the attack of the earth born C19¹⁴ virus is of any example. But people learn, so do governments.

The nuclear weapons of the day carry a nondescript, if not dishonourable, history in their making. Immediately after the second big war, unprecedented fear of the bomb caused everybody, who could “afford”, to run for it instead of away from

¹²Detter, I. (2000). *The Law of war*. Cambridge University Press. p. xvii.

¹³Ibid. p. 26.

¹⁴Covid 19, the corona virus disease. The virus identified as SARS-CoV-2 is said to have originated in China in 2019 and soon spread around the world. The vaccines were discovered early 2021. The world did not have a unified approach in handling the global pandemic but has been relatively matured compared to previous cases of pandemic situation.

it. Stalin (1879–1953)¹⁵ got it in 1946 through secret research extended in ten cities, collectively called the Atom Grad. Russia (Soviet Union, 1922–1991) became the second nation to hold a bomb close to its chest after America. The political polarity balanced under the bipolar system. That has to happen. Atomic race started in 1949 and still continues in spite of the end of Cold War. Today, it is spread over the world beyond treaties and regulations.

The perception is that nuclear weapons guarantee military deterrence and the ultimate humans have ever conceived. Ironically, humans look at the nuclear bomb just as a weapon, a kind of asymmetrical weapon. But how can a weapon be a weapon if it can never be used? A weapon is a device used to attack or defend. Defending also means preventive deterrence. A nuclear weapon has certain factors of deterrence. However, pre-empting a nuclear weapon by a nuclear weapon is not practical. So are the talks on first or second strikes. In so far as the post second big war is concerned, the nuclear arsenals of the world are nothing but pickled and sealed apocalyptical agents remaining in their cellars than weapons. They do not mature like wine, but can be converted into something more useful by common understanding. The world may need them, but handling such agents is different from handling weapons. The discussion is discontinued here to avoid deviation from the theme of this chapter.

From the theories of Sun Tzu (544–496 BC), Kautilya (371–283 BC), Clausewitz (1780–1831), the Japanese art of war and many others on war and strategy, it can be seen that all the combinations of the threat matrix cube (Chap. 4) are involved in military security. That could be another reason why military security was considered to be the primary element of national security or rather the concept of national security itself initially. Nations find it difficult to change this perception. At the same time, the nature of war is changing. The question is whether the ancient strategies also undergo change. The war on Serbia¹⁶ was an example of coalition warfare where the USA entered finally after showing reluctance initially.¹⁷ Whether it was a US tactic or not is a different question. They attributed the reason for living under the shelter of the USA for long. The interoperability problems in such cases and also between capabilities within a military system can bring a declared war a much non-desired human activity in course of time.¹⁸ International relations took new lows questioning the ethics and national strategies of those involved. According to the Jane's publication,¹⁹ the lack of first-hand experience of the politicians and the civilians in the world on military matters is the biggest single change since World

¹⁵Encyclopaedia Britannica, Ultimate Reference Suite, 2004, CD-ROM. Joseph Stalin (1879–1953) was the secretary general (1922–1953) of the Communist Party of the Soviet Union and premier of the state (1941–1953) who transformed it into a major world power.

War II.²⁰ In many western countries, growing affluence and a decade of no longer being physically threatened by war have reinforced the complacency of those who think they live out of range of the effects of worldwide asymmetric threats. All these have led to undermining the fighting effectiveness.²¹ In his work “War and Our World”,²² military historian John Keegan ponders over the question whether the concept of war is dying out. Keegan feels that the worst war is behind us. He compares them with the great famine and plague that once threatened to eradicate human life on earth. His examination of the origins of warfare, the relationship between the state and war, and the experience of the individual leads to the conclusion that wars will no more be a threat to humankind. Wars still continue, though majority of the humans are averse to it.

This study too believes in the quote, “War is over”. But then, what?

9.3 About Military Security

While the concept of war and preparations for it by the world’s militaries are exponentially and competitively progressing at breakneck speed in spite of the ultimate weapons in the stockpile, the element of military security, which once upon a time was national security itself, has reduced to one among the 16 elements of it, an irony of sorts. The incongruity is not because of the downgrading of the military aspects in modern governance but the fact that the world is still primordially centred on weapons not much different in purpose—to kill a human as before. Everyone is holding weapons including sticks and stones for the destruction of the other as if there is nothing more important than weapons for security. Security thus becomes selective by perpetual and hapless fear innate as well as adaptive in humans. Everyone holds a weapon and feels secure. Logically and mathematically, security does not come that way. Or, does it? Only one has the remote chance of survival in plausible terms if two wield weapons are against each other. This is not a philosophical soliloquy or a mathematical bingo, but a critical find that the world can never recover from the feeling of insecurity as perceived by them. They should know weapons need not be the only answer. However, they will never know. Humans in any form are not made that way. That is sad; that affects the well-being. A voyeuristic glance into military security will show.

It can be argued that weapons are not meant for killing the other person. They are meant for holding; it looks nice. Seen the guards outside the gate? One has to hold something; the supporters will say. Or humans are very considerate; they will not kill unless necessary. Furthermore, the necessity can come any time, like capital punishment. That also means there is uncertainty in the affairs of warfare. Not the fog

²⁰Ibid., p. 86.

²¹Ibid.

²²Keegan, J. (1998). *War and our world: the Reith lectures*. Vintage Books.

and friction. Fog and friction surrounds the entire military security not just the duration of war as attributed to Carl von Clausewitz²³ who, probably, never mentioned it the way attributed to him. However, the alliterative term ardently points out the uncertainty cited to military decisions. It could also be extended to other strategic decision-making processes.

Military is immersed in uncertainty and associated fog and friction. Military security, however, is a clear and definitive topic for discussions as an element of national security. The study of military security, however, has to go through war.

Military security does not talk about attainment of peace. The subject of national security itself is not strictly about peace or war; it is about the well-being of the people. The situations with respect to military security could be better said as war and other-than-war situations, rather than war and peace situations. Hence, it is the United Nations dictum of peacekeeping, peacemaking or peace enforcement that is more appropriate to the usage of peace than what wishful thinking for peace can provide.

9.4 About War

War is no hold barred extreme group behaviour under the ordained survival anatomy of humans. War is a thrust move a geopolitical entity makes to get out of a choking hold in the course of governance by an ambient situation which is not under its control even if the first move was made by it. A lot is spoken, written, presented, sung, analysed, played, explored. . . about war and its criticality in surviving human system fallibilities since yore. War is characterised by everything that humans fear and despise, but still engaged in by humans. That is why it is an extreme behaviour. The force behind it is power anxiety originating from insecurity. It is seemingly by default. That shows humans are still in the pit struggling in the early and primitive stage of development as a neural life form. It also supports the moving worm tunnel theory of unitary civilisation.

This study deals with war as a conflict between geopolitical entities that is declared as war subject to the laws of war²⁴. However, every country has the right to decide a conflict as a war against it based on its criminal legal system. A terror

²³The term fog of war is attributed to Carl von Clausewitz (1780–1831), the Prussian general. Like most military concepts, “fog of war” is normally attributed to Clausewitz, who receives credit for the alliterative “fog and friction”—friction referring to physical impediments to military action, fog to the commander’s lack of clear information. See <https://www.clausewitz.com/bibl/Kiesling-OnFog.pdf>. Clausewitz however uses fog and friction separately in his book. *ON War: Without the Fog*. Eugenia C. Kiesling. <https://www.clausewitz.com/bibl/Kiesling-OnFog.pdf>. Accessed 9 April 2020.

²⁴The laws of war refer to the component of international law that regulates the conditions for war (*jus ad bellum*) and the conduct of warring parties (*jus in bello*). Laws of war define sovereignty and nationhood, states and territories, occupation and other critical terms of international law.

attack against a state can be construed as war against it by the state and those who recognise the prevailing legal system. War, as it is, is not considered a crime in its declared legal format, but there can be crimes committed in the course of war. They are called war crimes and are punishable under the laws of war. This argument is based on the fact that if war was a crime, it would not have been subject to any law other than a law denying the right to declare and engage in war. This also argues the case why not laws of war are not law of war. War is permissible as of now. One of the reasons is that there cannot be a law of war as engaging in war by itself is not considered a violation of any law. In such cases, the military becomes something similar to a self-defence force which is only a term of convenience the state being under compulsive coercion by a superior order. It should not hold order. It shows there is much to do for seeking clarity on the whole idea of war in its socio-legal and econo-political security scenario, especially in the study of the concept of national security today. It may not be necessary, if the social system expurges the idea of war completely under imposed restriction. It is happening today. There are traces, but need to be watched longer. Even then military security as an element of national security will prevail as the military is not meant just for war but for military security purposes which is developing beyond military.

There are strategies and supporting tactics, all aimed to win wars. Strategy is a long-term competitive plan leading to a predetermined goal, the end objective. Tactics is a stratagem supporting the objectives of a strategic plan. Tactic is a short-term plan similar to strategy. However, the objective is fulfilment of the progress of the strategic plan dynamically at a particular time. Both the parties will develop strategies and supporting tactics. But only one can win in war. Even that could be a Pyrrhic victory²⁵. This is dawning in human consciousness slowly in today's situation and perhaps leading to a warless world giving space to conflicts and other violent human behaviour patterns. The absence of war does not mean conflict holiday. It is improbable by human nature. The absence of war can create situations of conflict. Military strategies and tactics were amply proscribed by experts and scholars since time immemorial. It is not even clear whether some of the quoted strategists, especially earlier ones, were ever born. Maybe such names would have been associated with long-drawn-out compilations carried forward by successive groups of experts with add-ons. There are many such people in fiction and reality. Interestingly, everything that everyone said to have been said makes sense in one way or another. That is one of the reasons why this study considers war from the extreme behaviour perspective. Fog, friction, volatility, uncertainty, complexity, high ground, ambiguity, friendly fire, deception, stealth, strategy, tactics, high ground, *Coup d'œil* . . . are the terminologies that substantiate war and how to play it.

²⁵ A Pyrrhic victory is the one where the toll is devastating even on the victor. It could be well said a defeat as the toll negates any true sense of achievement or damages long-term progress. The term finds place after King Pyrrhus of Epirus, who won the wars against the Romans in Heraclea in 280 BC and Asculum in 289BC but suffered irreplaceable losses that weekend him further.

Historically, wars were fought for territorial annexation. The purpose of war changed to colonisation, resource mobilisation, political survival, nomadic violence, power projection, religious domination, succession, economics, domination and, at times, sheer vindictive behaviour. There could be more. Today, military security means maintaining the nation's physical security, economic interests and values against foreign aggression. The purpose of military is more to defend than to invade for annexation of territory. It is further modified to the sense that the military is engaged in pre-emptive action and surgical strikes besides preparing for second strike capabilities in a nuclear attack for governments with such policy in their nuclear doctrine.

9.5 War in a “Peaceless” World

The world is peaceless with its extremely restless human systems. Peaceless is a word less used because people prefer to use the term violence in place of peacelessness more. The world was generally violent all these years with wars raging all around at any given moment. The colour of war is red; it turns black swiftly. The odour is of putrefied human flesh, blood and body fluids. The warzone is hell ravaged echoing with sounds of the fallen whining in agony. The brunt is taken by all. The pattern of war has changed with time, but everything else remains.

History is the prime witness of war. If history is turned fast, one may see the emergence of war around third millennium BC in its active form as armed conflict brewed in absolute lawlessness when pastoral societies developed counterattack forces to respond to savage raiders.²⁶ People fought in disorganised clusters even before that. By about 1300 BC, the first military empire emerged in Assyria. By the nineteenth century, it was felt that the state and war was inseparable. That was a long way. Revolutionary French Republic set the pattern of compulsory military service. But lately, war and militarism seems to have lost authenticity. Public respect for military service dating back to ancient times lost its glitter. War with its punishing duration and unparalleled destruction of life is despised world over. While the world felt that major wars were almost history, the opening shot of the twenty-first century showed otherwise. The revival was caused when terrorism, already well-established in the world as poor world's asymmetrical warfare against the more powerful, widened its jaws a bit more than it could snap back. The jaws got dislocated and the world went hysteric at the gaping mouth of terror. That led the relatively powerful nations take to war against terror. It only shows that war is here to stay as long as terrorism is on.

There is a slowdown in declared wars in the present century. The world has already witnessed countless wars and irreversible destruction and mayhem. The

²⁶Paleri, P. (2008). *National security: imperatives and challenges*. Tata McGraw-Hill Publishing Company Ltd. p. 127.

permissiveness of the human system with war can be seen in a close look at the anatomy of war in history. Some of them that kept the time ringing without a serious holiday are projected in the succeeding paragraphs to understand the common parameters that are associated with wars fought by humans (who else?) on earth.²⁷

The author has taken limited freedom in the period classification of wars to deviate from the originally accepted time periods of history and age classification while chronological charting of wars in particular reference to this study. The point is to arrive at the period of sovereign nation states as it is the only relevant factor in understanding the concept of national security and its governance as on date. For practical purposes, the period since the formation of nation states is important to examine war and its reflections on military security. But being the oldest element, and also the concept by itself at the beginning of human systems, it is necessary to appreciate the conflict scenario at least in a limited manner throughout the period of human species. This is also important to assess the future of conflict including war and understand the trends in military security.

One of the ways the human history is divided is in two periods: (1) before the Common Era (BCE) and (2) Common Era (CE).²⁸ Another way is in three periods: (1) the ancient history (3600BCE–500), (2) the Middle Ages (500–1500) and (3) the Modern Age (1500–present). Yet another way is (1) ancient time period (before 400BCE), (2) Medieval and Renaissance time period (400 BCE to 1600), (3) early modern time period (1600–1850) and (4) the modern time period (1850–present). All these and many more such period classification depend on the human system appreciation with respect to its universal and geographical reference lines for contextual explanation. None of them are taken as reference points to explain about the war and military behaviour in this study. Instead, the periods have been modified to suit the discussion in chronological behaviour patterns of human and human systems. The reference periods may be seen as a kind of conflict periods or ages accordingly.²⁹

²⁷ Compiled and analysed by the author from an array of books, records and notes. Important among them are by Castleden, R. (1994). *World history*. Paragon.; Encyclopaedia Britannica CD Rom, 2004; Blainey. (2001). *A short history of the world*. Penguin Books; Wilson, C. (1984). *Criminal history of mankind*. Granada.

²⁸ In the macro sense of time and Earth Geologists have systematically divided up, and named, all of Earth’s roughly 4.54-billion-year history. From the longest to shortest, these lengths of time are known as eons, eras, periods and ages. Currently, we are in the Phanerozoic eon, Cenozoic era, Quaternary period, Holocene epoch and (as mentioned) the Meghalayan age. Geggel, L. “We Are Now Living in a New Geologic Age, Experts Say”. 18July 2018. <https://www.livescience.com/63103-meghalayan-age-within-holocene-named.html>. Accessed 23 February 2019.

²⁹ The periods in history are not synchronous. There is the old world and the new world. But the humans who lived in the old world are the same, and their intellectual growth rate is delved in the singularity behaviour with the superimposed differentiability approaches. But the application of intellect seemingly changed. This opinion is derived from the fact that at any time in any system one may be able to see humans who represent the entire space and time period dimension so far. This hypothesis needs further study.

Table 9.1 Period classification of war

	Period	Changes in military security situation profile
1	Extended pre-proto historic wars	BC. Anatomy is not clear to analyse change. The period is Paleolithic Age, Mesolithic Age, Neolithic Age and Bonze Age
2	Wars between extended pre-proto historic period and pre-nation state (1648)	Birth of nation states subsequent to the treaty of Westphalia
3	Inter-period 1648–1919	End of World War I; birth of the League of Nations
4	Inter-period 1919–1945	World War II; nuclear weapons; beginning of Cold War; birth of the United Nations
5	Cold War (1945–1991)	Disintegration of Soviet Union
6	Post-Cold War	Till major changes in the UN will take place
7	UN reforms and interventional changes	High-power panel recommendations (2004)
8	2021	“War is over,” conclusion. Time to observe transformation of conflicts

This way of explaining the wars ideally covers three periods: (1) prehistory, (2) protohistory and (3) history. The prehistory period comprises the long period between the appearances of the first human species and the invention of writing systems, estimated to be in 4000 BCE. The interesting aspect of end of prehistory or any of the lower modes of history in any application is that the bottom date still continues elsewhere in the world. That explains the worm tunnel theory of unitary civilisation for the world outlook as a whole. That is why history is an evolution with the beginning still part of the present. Therefore, protohistory, the period that began when prehistory ended (which is still on in some parts of the world), is a continuity in time as a tail. Protohistory is therefore the period of transition between prehistory and the earliest recorded history.

Further, it is necessary to understand that referring to a period with respect to a war or any dynamic human activity or incident is different from referring to a war or incident with respect to a period. It depends on the focal point of communication—whether it is modifying the time with the topic of discussion or modifying the topic with the time. Until such time the scenario of war changes drastically, it may be better to refer to a war with respect to a period. However, the history of wars identified for this study in military security may be examined both ways: in the contexts of the period with war and the war with the period. The explanations are given accordingly. Table 9.1 depicts the period and changes in the military security situation profile accordingly as a reference in this study elaborated further thereafter.

9.5.1 Prehistoric and Protohistoric Period Wars

The use of the term pre-proto history is to cover two periods separated where there is no real-time recording of history. This period covers the prehistory that covers the

Stone Age and the Bronze Age before the Iron Age. The Bronze Age is different from the approach to war as a wholesale conflict which amazingly has many comparisons of the wars of the day in military strategy and tactics.

Though it is believed that the ancestors of today's human beings fought for hunting grounds as early as 37,000 years ago,³⁰ the first war is said to have made a difference in human conscience and still talked about was the Trojan War between the Mycenaeans (Greek) and the Trojans (the people of Troy in western Anatolia, present day Turkey, at the mouth of the Dardanelles strait). The war that was said to have occurred in 1250 BC lasted about 10 years. It stirred up the imagination of the ancient Greeks. The story was celebrated by the Greek epic poet Homer (850 BC) in his epic *Iliad*. Historically, it is believed that Troy existed near Turkey at the Mediterranean near the Black Sea entrance. There is no proof that the war was real or even if real whether it happened the way it was narrated. However, there cannot be a time description in the format of history, legend or myth unless one can rightly point out the fantasy mindset of an illusory idealist behind it. History, legend and myth are the three forms the humans look into time behind them in which humans along with activities get pickled in the brine of time. So there has to be some truth in the pickle about what and how the contents were before transformation. For a bard, poet or versifier, every narrative, lyric or drama is either laced or based on some facts even if they are micro matters. That is why a story teller is anyone but a hardcore idealist. Whatever the narrative of Trojan War draws the curtain wide open on the way wars were fought in those days.

The cause of war was attributed to avenge a personal loss of esteem and honour. Helen, the wife of Menelaus, and the brother of the super-powerful king Agamemnon of Mycenae fled with Paris, the prince of Troy. However, the underlying objective was said to be greed for power and domination for Agamemnon. Agamemnon along with his forced alliance of kingdoms used the situation to conquer the impenetrable Troy ruled by the popular king Priam and his bold warrior son Hector, the elder brother of Paris. Agamemnon won the war after 10 years by deception—soldiers hiding in the not-so-soft underbelly of the wooden horse that was pulled in by the superstitious Trojans (which was guiding threat to self by the target, an interesting case in threat perception). The giant wooden horse was built by Epeius, the master carpenter and pugilist based on the idea of Odysseus.

Penetrability of the enemy terrain always remained the most difficult part in war. Deception was the cheapest and easiest tactics. Though it requires cutting edge tactical acuity to succeed, deception takes away the ethics of human value and code of honour from war. In the modern world, deception is a cheap strategy and not acceptable under the principles of geostrategic security. Deception causes permanent damage in international relations in the long run. The story of deception

³⁰ Castleden, R. (1994). *World history*. Parragon. p. 1. The larger brain *Homo sapiens* replaced the physically stronger but lesser brain powered Neanderthals around 38,000BC becoming the advanced humans. By 35,000BC, they disposed the Neanderthals from their hunting grounds.

is hard to die in human conscience. That is why Trojan horse still lingers on even in this century.

Trojan War was wholesome and fiendish. Especially so considering the period it was fought. There was a definitive and well-defined end objective with underlying hidden objectives. Multi-terrain specificity was evident in the sea-land war with massive sealifts in which a fleet of thousand ships was said to have been deployed by the Greek coalition forces according to the legend. The hunger for domination and the way for coalition forces were explicit. Some of the members joined under coercion. Achilles, projected to be the world's greatest warrior whom Agamemnon could not discount in this campaign against the impenetrable Troy, was also rebellious and conceited. He was more a narcissistic leader than a disciplined soldier. Many such leaders are visible in today's armed forces. He continued with his problem attitude throughout the war. Such differences in behaviour patterns in a war situation can be seen between commanders and forces of any period. There was violation of ethics, abuse of prisoners, misdirected killings and, above all, deception as key to victory—a dirty war indeed. From the Trojan angle, what proved was the importance of defence in warfare. In today's terminology, it may be seen as cost of defence. Sometimes an offensive action may be required to overturn the cost of defence. Such offensive action may be termed as part of defence. The War also showed how naval power influenced ultimate victory from the earliest known period of warfare in time. Situation may change in the future with outer space replacing the sea in reach and stealth. In a nutshell, there is nothing new to offer in warfare today compared to the legendary Trojan War of more than 3000 years ago.³¹ Every character of the legendary war and the aspects of the war itself can be seen in today's wars too. The changes or deviations, if any, are very marginal that the author dares to say cosmetic. The reason and argument for it is that wars are still fought between humans; so how on earth can they change, unless humans change?

What can be the truth behind the story told by the bard? The war as well as the city of Troy is generally considered non-historical. However, it looks during the post protohistoric period the world was more learned and incidents happened using the advancement brought by knowledge. The oceans were a livable and connectable terrain with other parts of the world. People knew how to negotiate the ocean without which Homer, in spite of being blind as is said to be and accepted, would not have known about the possibilities of happenings around. There were similar stories. Was the Indian epic *Ramayana* of some connection for Homer to hear and reconnect as nurtured by fantasy tale weaving knowing the ancient link between India and Greece? This requires dating *Ramayana*'s original oral narratives relative to Home. It is not the intention here.

There could have been a prolonged war between two countries in the area or nearby on similar grounds in those periods. Looking at distances across the ocean and also being multi-terraneous, certainly wars will be prolonged. It is not possible to

³¹ Modern dating is 1260–1180 BC. Trojan War. Wikipedia. https://en.wikipedia.org/wiki/Trojan_War. Accessed 23 January 2019.

carry out a surgical strike and get the lady back before the evening prime time news. Besides, will a king (as well as the coalition leaders who accompanied Agamemnon) wait for ten long years beyond their shores and spend all what they have abroad in a war leaving their own countries in the hands of others without any form of communication? It may happen in an expedition or exploration odyssey. Were they sure they would get back to their countries in shape and form? The artificiality in the story of Odysseus’ encounters and the tale of his wife in Homer’s other epic poem *Odyssey*, sequel to *Iliad*, can be applied to this theory of storytelling with a sprinkle of actualities. *Odyssey*, the journey of Odysseus the designer of the Trojan horse and probably the best player on the winning Achaean (Ancient Greece) team who turned the war in favour of Agamemnon, was more on the difficulties of getting back without direct divine help. Incidentally, it could be said that *Iliad* was historical in big parts, whereas *Iliad 2*, the *Odyssey*, was a fictional sequel to it.

In spite of such ponderings, there would have been a war or resource hunting across the ocean lead by the adventurous Achaeans. The period of the story was in the Bronze Age. The truth can be visualised in the period. Joseph J Romm commented that the Trojan War might have been fought in part over tin.³² Tin is a vital element for making bronze mixing it with copper, the main metal. Most of the wars were fought in the world over resources. A war of resources became an epic poem in the hands of an extraordinary story teller—Homer the bard. Was he real or was it a pseudonym for a group of entertaining writers? That is not relevant in this study as long as *Iliad* exists and it talks about the war, the kind that is best suitable to begin within the discussions over wars of the world.

There were wars undoubtedly real in the region of the participants of the Trojan War a few centuries later. Wars erupted in affluent Greece when the time of freethinking was dawning. The largely famous Peloponnesian War broke out between Athens and Sparta in 431 BC that lasted 28 years. The freethinking philosophers came under extreme pressure. Socrates was one among them. There was already a decree against atheism issued against philosopher Anaxagoras (500–428 BC)³³ who had to leave Athens. The majority and powerful vehemently opposed the philosophers whether for impiety or being just different. If the disorder caused by such decrees and wars were not sufficient, the port of Athens and other neighbouring parts faced a serious problem with the outbreak of killer plague. Death and social impairment seemed to have a choice! The people attributing the cause slaughtered thousands of visitors to Athens. Are there similarities today in a pandemic? It was also the period of Hippocrates (460–377 BC).³⁴ Plato was born around the period. The Peloponnesian War, along with plague, ended in chaos with the Athenians losing faith in the gods and the rule of law. However, war continued in

³²Romm, J.J. (1993). *Defining national security—nonmilitary aspects*. Council of Foreign Relations Press. p. 21.

³³Encyclopaedia Britannica. Ultimate reference suite. CD-ROM. 2004. Anaxagoras was Greek philosopher and cosmologist who discovered the true causes of eclipses.

³⁴Ibid. Hippocrates was the Greek physician who is traditionally regarded as the father of medicine.

different forms by revamping and reorganising the military forces by those who followed. It was sea-land warfare with heavy deployment of naval forces.³⁵ The war ended temporarily in 421BC by the peace of Nicias. Peace was negotiated by king Pleistoanax of Sparta and Nicias, an Athenian mine owner. There was also hostage taking by Athens. The Athenians found it difficult to continue the war of attrition and finally surrendered in 401 BC.³⁶

With this, war became a prolonged affair with high dynamic inertia in the absence of powerful regulatory forces. War came along with other miseries including deterioration of food and health security. An interesting find is that in a disaster scenario (a pandemic in this case) the people may lose faith in their own gods and contemplate change. It has also shown that wars never end by a lull in between even if the cause of the break is more serious than it. Wars renewed with more vigour. An example is that during the 26 December 2004 tsunami in Asia, in the insurgency torn Sri Lanka, there was hope that the disaster may pave way for peace negotiations. It was only a temporary reprieve. The human follies of conflict continue. The world has seen all these before. It may not be so with the living generations who go through an event as if it is experienced for the first time. Another interesting aspect is how non-governmental players enter the world of negotiations during war and influence its outcome. The Peloponnesian war reinforces dependence on naval forces for sealift. The naval fleet became synonymous to logistics movement en masse with the earliest wars in history.

The Punic War between Rome and Carthage came years later. The war was fought in three phases: 264–241, 218–101 and 149–146 BCE. This too was land and naval warfare. In the second phase of the Punic War, the Carthaginian General Hannibal's (247–183 BC) army slaughtered 16,000 Romans in Lake Trasimene. History records the lake becoming red with their blood. In 216 BCE, Hannibal annihilated a Roman army of 70,000 by slaying 50,000 of them. Hannibal would have believed that was the best way to dispose of the enemy with weapons that were not self-destructive—the swords, the most user-friendly³⁷ and reusable weapon of any period. One could conveniently slaughter any number of people with just one sword. The wars that lasted more than a century ended with victory to the Romans. 50,000 Carthaginian men, women and children were sold into slavery. Cruelty, death

³⁵ The epics of the Trojan and the Athenian wars show the importance of naval warfare in sealift and reach and also that human engagement in naval warfare was as old as the land battles. It also empowers the ocean as a terrain as old as the land itself, at least from the military security angle.

³⁶ This is an interesting aspect that shows involvement of the rich and powerful in war (the corporate involvement) as well as blackmailing and terrorism (hostage taking). What we see today in terrorism and corporate involvement in deciding on war and arms dealership, etc. are nothing new. All these confirm the law of invariance.

³⁷ The terminology “user-friendly weapon” is used to explain the process of killing in the most convenient way. The author is of the opinion that no weapons in the world are to be treated user friendly. The combatant should be “weapon-friendly”—that is how they are to be selected and trained for maximum effectiveness in using a weapon.

and mayhem became part of the lexicon of war. The colour of war turned to blood red

In the early period, the best way to dispose of adversaries was to slaughter them or sell them as commodities. It was easier than keeping them, besides generating income for recouping the forces for another war. It continues today, though in a different form. Victims of war end up in the same conditions of misery.

9.5.2 Wars between Prehistoric and Protohistoric Period and Pre-nation State

The time covered earlier is the longest and perhaps the most violent so far. The wars were absolutely dark, gritty and black. The exactness of happenings during the period is mythical as the time has been irreversibly waded through them for long without being extrapolative with clarity. Looking into the time that has gone past is like looking down the mid-ocean on a bright day. The water is crystal clear up to the depth the sunlight can creep in. Thereafter, it is dark slowly turning to pitch black as if blind folded in the darkest alley. Time is like that. Human intellect is the light. It can only penetrate a limited depth into time, irreversible or yet to pass over. It will be further undermined by constraints of the seeker such as prejudices and compulsions. These impair even a murder investigation. That is why we do not know what we “do not know”. This inability to intellectually penetrate into time even when there are signs, such as a fossil with a gash on cranium visible, leaves an investigator to intuit conclusions. The period discussed so far was “more violent” is such a conclusion. Because violence is a part of human response to survival pangs which were more in the early periods than the present. Probably, it could be less in the future. That is another reason for the quote “war is over”.

Bronze Age dissolved into Iron Age around 800BCE with the advent of metallurgy. There are questions among scholars whether the world is still in Iron Age, which is not very relevant for this study. The next major war worth examining came about a thousand plus years after the Punic War. The war was based on religion and came to be known as the Crusades.

The war was the culmination of conflicts between two new religious belief systems in the world—Christianity and Islam. They were initiated, supported, and sometimes directed by the Latin Church to control the spread of Islam in the medieval period between 1096 and 1291 for the control of the Holy Land. Pope Urban II initiated the First Crusade (1096–1102) in order to aid the Christian Byzantine Empire, which was under attack by Muslim Seljuk Turks. The series of Crusades of the first wave ended in 1291, when the Latin Christians were finally expelled from their Kingdom in Syria by Muslims. The crusade did not stop there. It continued for several centuries. It was the Protestant reformation and subsequent dilution of the authority of the Pope that cooled down Crusades. The Crusades were short wars. Initially, there were four phases in short bursts: 1096–1099, 1147–1149,

1189–1192 and 1202–1204. The crusaders with the support of the prevailing religious order were engaged in plundering, raping and butchering along the way they advanced. It became a way of life. Each crusade lasted 2–3 years at a stretch and was fought between the Saracens³⁸ and the Christians over Palestine. Crusades extended further into the thirteenth century. Crusades also turned to human systems including heresy,³⁹ not only Muslims. Pope called it special kind of war against the enemies of faith. It was continuous war between Catholic Church and others whom the former considered are changing them under the acute fear and anxiety of a powerful group about existence. A close look at history shows the crusades are not yet over and still continue in a different form. The reflections are visible on a clear surface. This simmering discontent between faiths and associated conflicts in the name of faith are all covered as crusades today.

With the advent of formal religions, which this book addresses as religious cultures, war became seriously affirmed as a way of life for the humans. They got something seriously acceptable for conflict—targets to eliminate. War, the threat, thus created targets or the attractiveness of the target created the threat of war is a matter that needs to be defined. However, the fact is that the threat and target coexists. If the threat has to go, the target has to vanish or the threat will vanish if the target goes. In both ways, it is impossible to expect an immediate withdrawal from the scene. That is where the public opinion and governance matters. This will be aggravated when the world is religious, and therefore balancing over a binary bipolar axis provides relief to a great extent.

The formation of nation states is another century away. That happened subsequent to the conflicts within a single formal religion—the Christianity. Before that, the Hundred Years' War rolled up. It started between England and France in the English Channel in 1336 when Philip IV with the armada of France appeared there. It was a continuous struggle between England and France thereafter to take over possession of the Channel and each other's territory. The cost escalated and France even imposed tax on salt 5 years later. Generations of kingdoms challenged each other across the Channel and also within the families. The rest of the world moved on with wars of relatively smaller magnitude at different places. Travellers went around exchanging information in a world that was primarily insular but aware of someone on the other side. Empires came up by conquest and surrender. Then came a new enemy in Europe—the plague, re-entered in 1348, this time known as Black Death.

Italy, France and England were under the grip of Black Death. In fear and panic, people accused Jews of poisoning the wells and spreading the pandemic. Thousands of Jews were publicly prosecuted by burning or hanging to death. The persecution of Jews and the distaste for Jewish culture began in Europe. They were to remain victims of persecution from then on ending in holocaust many years later. The Black Death brought a respite to England's Hundred Years' War with France. However, it

³⁸ Saracen means a member of pre-Islamic nomadic group of the Syrian-Arabian deserts. A Saracen is also an Arab or a Muslim during the period of the Crusades.

³⁹ An opinion or doctrine that challenged Christian religious orthodoxy.

resumed in 1354. England made great territorial gains in France under Edward III, and the first phase of the hundred years' war ended with the Treaty of Bretigny in 1360. King John II of France who was kidnapped was released by England for a ransom. Even then he had to leave three of his sons as hostages behind. He had to return to England when he failed to raise the ransom of three million gold crowns. In 1372, Charles V of France regained control of the Channel. The war continued. Charles VI made a truce with England that lasted for two decades in 1396. France recovered slowly from the defeats and Charles VII gained more control over England by 1436. By 1451, the English were expelled from every part of France except Calais. Henry VI of England became insane along with it from which he soon recovered. The Duke of York who was his protector was thereafter removed by him.

It was a period when powerful territories vied for domination especially when caged with feeling of smallness of land terrain they possessed. This was passed on to generations. The mind shifted to victims for prosecution. Hostage taking for ransom became a practice. Acts of terrorism by the presumed weak showed its head. Royalties lived and died dangerously accumulating fat, metabolic syndromes and mostly inglorious wealth. Enmities persisted beyond generations.

The next inline was the Wars of the Roses. In 1455, war broke out between the House of York and the House of Lancaster with the Battle of St. Albans. The Yorkists won the battle in 1460 when they took Henry VI as prisoner. The Yorkists' victory continued. The houses of York and Lancaster were united in 1486 when Henry VII of England married the daughter of Edward IV. Relationship in the family mattered in conducting and conjuring peace in a war. Humans have the uncanny knack of sifting solace through relationships when times become hard and uncontrollable.

A series of French civil wars were set off in 1562 when Françoise Duc de Guise ordered massacre of Huguenots (French Protestant) at Vassy. The Huguenots retaliated by murdering Catholic priests. In 1563, temporarily, peace was restored between both parties with the murder of the Duc de Guise by the Huguenots. Both joined together in 1564 against England. However, the trouble between the Huguenots and the Catholics brewed in serious disorder. 15,000 Huguenots were brutally murdered in France in 1572. It lasted till Henry IV by the Edict of Nantes gave Huguenots political rights equal to that of the Catholics in 1598.

War every now and then proved not only violent but an epicentre of cruelty and sadism. Cruelty in war touched unseen limits. Religion became another name for war. Besides wars between religions, those within religion became another cause to celebrate cruelty. It continues today—the clashes within a civilisation. They are old forms of entrapped human behaviour and assertions that wars cannot be easily eliminated from the world full of humans.

On 23 May 1618, with the defenestration of Prague, the war that created nation states at the end of it all began in Europe. The beginning was when the future Holy Roman emperor Ferdinand II, in his role as king of Bohemia, attempted to impose Roman Catholic absolutism on his domains. The incited Protestant nobles of both Bohemia and Austria rose up in rebellion. The war that later came to be known as the Thirty Years' War went beyond religion. It became a series of wars fought by

numerous territories in Europe for different reasons: religious, dynastic, territorial, political, commercial and others. It ended with the Treaty of Westphalia in 1648. The treaty changed the map of Europe irrevocably. During the Thirty Years' War, most of the part was fought by hired mercenaries.⁴⁰ When they were not paid, they adopted what later came to be known as "wolf-strategy" by preying on the villages. That typified this war. The armies plundered as they marched, leaving cities, towns, villages and farms ravaged. When the contending powers finally met in the German province of Westphalia to end the bloodshed, the balance of power in Europe had been radically changed. This is a war that introduced mercenaries in the scenario. Large number of battles was fought subsequently that included hired soldiers. It is on today.

The wars saw new recruits who did not have the true identity of the side they were fighting except for paid enlistment—the mercenaries. They were the pros. They ended up gung ho in disloyalty and impiety when the wars were over. Their generations continue today as a breed of hired band of illegitimate soldiers, especially in asymmetrical wars across the world. But the end of the thirty years war brought permanent and long-lasting changes along with rays of hope that the future would be orderly and safe. However, a nation state does not have the competence to abolish wars, simply because it is a behaviour pattern of the humans ingrained in their psyche from the day of evolution.

9.5.3 *Inter-period: 1648–1919*

Just when it was thought that the notion of sovereignty and nation states has brought an end to war in Europe, situation worsened in England with the Civil War in 1642 between Cavaliers and Roundheads. It was known as the great rebellion. Parliament's greater economic resources presaged the conflict's ultimate outcome. Whereas Royalist support came largely from Wales and from the North and West of England, Parliament held the richer South and East and controlled London, the majority of the ports and the navy. Parliament was able to levy taxes, but for ready money the king was dependent on his supporters. It had no clear outcome, though the war continued. In July 1644, Oliver Cromwell's army registered a decisive victory in the Battle of Marston Moor. In 1645, in the Battle of Naseby, the military phase of the English Civil War ended when Cromwell defeated the Main Royalist army. In England, the Civil War ended with the surrender of Charles I to the Scots in 1646. But he still hoped to exploit the differences between his opponents. Black Death struck again. In 1647, between raging commotion, the Scots sold Charles I to the Parliament for £400,000. He was taken prisoner by the army, but escaped to Isle of

⁴⁰Hired mercenaries are part of most of the wars even today. In some cases, they may not be called mercenaries, though. They kill for their pay cheques. They are more in demand in proxy wars that state or non-state regime sponsored terrorism propound.

Wight. There he signed a secret treaty with the Scots who promised to reinstate him in his throne by force. In 1648, the English Parliament renounced Charles I when it discovered his secret treaty with the Scots. In 1649, English monarchy was abolished, and the Parliament set up a Commonwealth run by a Council of State.

Economics, ransom and internal conflicts slowly found their way into human conflicts graduating into full-scale wars. Navy was ever present. Its importance could not be underestimated. Secret negotiations and scandals startled the people. Those were the early days of the Watergate.⁴¹

In 1689, Louis XIV of France engaged in a major war called the War of Augsburg that lasted 8 years against an alliance led by England, the United Provinces of the Netherlands and the Austrian Habsburgs. Louis XIV with the best army and navy in Europe during the period was aiming at a shift in balance of power to France when the rival Habsburg dynasty was to be left heirless with the demise of their insane king Charles II, the last male heir of the Spanish-Habsburg line. There was uncertainty in Europe over the succession to the Spanish throne because the king was unable to produce heirs. Though initially succeeded, the French fell. The war saw the rise of England and Austria as effective counter forces to France. Louis XIV’s expansionism and hatred towards Protestants made him more enemies in England, the Dutch and the Emperor of Rome Leopold I. When he died, his body was borne and jeered by the populace. The revolution was crawling on its way unnoticed.

Wars within religion and alliances (coalition) in warfare have become permanent affair by this time. Geostrategic mindset slowly developed at least within the roundels of perceived nation states.

The Great Northern War between Sweden and an alliance of Russia, Denmark, Poland and Holland for supremacy in the Baltic area began in 1700. Sweden was a major power in the area. Sweden had succeeded in blocking Russia’s access to the Baltic. Other countries had their own reasons that primarily included their loss of territory in the Scandinavian Peninsula. The anti-Swedish coalition made swift victory and occupied most of the Swedish area. Sweden opened peace negotiations in 1717–1718 while simultaneously expanding its army to 60,000 men in anticipation of a new offensive. By the Treaties of Stockholm (1719–1720), Sweden, Saxony and Poland returned to the status quo ante bellum, and Denmark gave back its conquests to Sweden in return for a substantial sum of money. Sweden ceded most parts to the coalition countries by 1721 thus ending its domination of the Baltic area.

The war between Spain, France and Bavaria on one side and England, Holland, Austrian Empire and Portugal on the other, later known as the War of Spanish Succession, broke out around the same period (1701–1714). Louis XIV had already engaged in the War of Augsburg for the same reason, much earlier, and withdrawn

⁴¹The political scandal in the USA involving the administration of US President Richard Nixon from 1971 to 1974 that led to Nixon’s resignation. Watergate complex housed the Democratic National Committee Headquarters in Washington, D.C. Police arrested burglars broke-in to President Richard Nixon’s re-election campaign. Since then Watergate as a term linked abuses of political office, skullduggery and cover-ups.

by military, political and personal decline at the end of it. King Charles II when died had already bequeathed the Louis XIV's grandson who remained king of Spain, but the treaties of Utrecht marked the rise of the power of Britain and the British colonial empire at the expense of both France and Spain. In this latter aim he failed, for his death led to the War of the Spanish Succession and the dismembering of Spain's European possessions. The succession wars continued. Next was the War of Polish succession (1730–1738). Started in 1730, the war was fought by Russia and Poland with France. Though it was a conflict to determine the successor of the king of Poland Augustus II, it was only pretext for the parties to settle other issues. The war resulted mainly in a redistribution of Italian territory and an increase in Russian influence over Polish affairs. The war ended with the treaty of Vienna in 1738.

Two years later, in 1740, the next succession war erupted in Europe—the War of Austrian Succession. The war was between Austria and Britain and Prussia, Bavaria, France and Spain. The War ended in 1748 with the Treaty of Aix-la-Chapelle.

Colonialism had its share of war between countries in alien terrains. The Seven Years' War, started in Europe in 1756 by Prussia supported by Britain against Austria, France and Russia, ended abroad in the colonial world against overwhelming odds in 1763. The British triumphed completely over France in India and America and gained substantial territory in the colonial world including Africa.

The wars started reaching out with the advent of colonialism in the world, and states fought elsewhere in their occupied colonial territories. Today, it still continues in a different colonial form though restricted to the powerful. Nations fight their wars elsewhere and not in their own countries.

The American War of Independence (1775–1783) was an uprising. At the end, 13 of Great Britain's North American colonies won political independence and went on to form the USA—a new nation instead of 13 different nations. After the successful conclusion of the Seven Years' War (1756–1763), the British government felt confident on their colonies especially in America to make them pay more by tax. That aroused heated opposition. The American colonists resented the trade regulations by which Britain utilised American economic resources to its own advantage, and they, likewise, resented their lack of representation in the British Parliament. British intransigence to these grievances spurred a growing desire for independence on the part of the Americans. Open fighting broke out between the British and Americans in 1775, and the next year the American colonies declared their independence from Britain. On 4 July 1776, American Declaration of Independence was signed in Philadelphia. The conflict that began within the colonial empire soon became an international war. The Americans assembled both state militias and the Continental (national) Army, with approximately 20,000 men, mostly farmers, fighting at any given time. By contrast, the British army was composed of reliable and well-trained professionals, numbering about 42,000 regulars, supplemented by about 30,000 German mercenaries. The war ended with the Treaty of Paris on 3 September 1783. Great Britain recognised the independence of the USA.

Napoleonic Wars of 1793–1815 were massive campaigns in terrain expanse, logistics support, cost of operations and personnel. They were continental wars. It ended in 1815 in the Battle of Waterloo when the British with their allies (Austria,

Sweden, Russia and Prussia) defeated Napoleon and their supporters. The wars were fought both on land and at sea. The French were very superior over land. The civil defence force in Britain was increased under the fear that France may invade Britain any time. The militia and the voluntary reserves were increased. According to estimates, one in four adult males in Britain was in uniform in the nineteenth century. Napoleon's defeat at Waterloo helped Britain to dominate much of the world for a century thereafter.

The Greeks fought with Ottoman Turkey in the War of Independence in 1821. The Greeks of all classes nurtured Hellenism, or sense of Greek nationality, fostered by the Greek Orthodox Church and the Greek language. Revolts broke against Turkish rule in January 1822. Internal rivalries, however, prevented the Greeks from extending their control and consolidating their position. In 1823, a civil war broke out. Egyptian sea power supported Ottoman Turkey. The Greek cause, however, was saved by the intervention of European sea powers. A settlement was finally arrived at a conference in London. With the adoption of London protocol in 1829, Greece became an independent monarchical state.

The American continent witnessed its own major wars. In 1846, war erupted between Mexico and the USA when the former refused to sell New Mexico to the USA. However, the Mexicans were bullied in typical realtor arm-twisting mod by the powerful USA and defeated in the 2-year war. The war ended with the Treaty of Guadalupe Hidalgo. Mexico gave all the lands north of Rio Grande to the USA for 15 million dollars. It was one third of the Mexican territory.

Grabbing real estate by paying for it, if necessary under coercion, was a dictum that worked well for the USA in consolidating its land holdings with strategic wisdom. War was used more than a rap on the knuckle when the owner refused to let go the land even on payment. Buying land from the neighbour is a method of trouble-free transfer and could be used to resolve disputes, because it is a win-win solution, though there is certain degree of coercion and loss of face and esteem to the other party. However, there is a consideration for the land thus transferred. But such system did not prevail outside the USA or continue in the world.

The Crimean War (1853–1856) was mainly confined to the Crimean Peninsula between the Russians and the rest that comprised the British, French, Ottoman Turkey and Sardinia-Piedmont. The war arose from the conflict of great powers in the Middle East and was more directly caused by Russian demands over the Orthodox subjects of the Ottoman sultan and a dispute with France over the privileges of the Russian Orthodox and Roman Catholic churches in the holy places in Palestine. It was a major war involving land and naval forces. Early 1856, Russia accepted the peace terms. The Treaty of Paris signed on 30 March 1856 guaranteed the integrity of Ottoman Turkey and obliged Russia to surrender southern Bessarabia, at the mouth of the Danube. The Black Sea was neutralised, and the Danube River was opened to the shipping of all nations. The Crimean War was managed and commanded very poorly on both sides. Disease accounted for a disproportionate number of the approximately 250,000 men lost by each side. It was also a moral blow for Russia that awoke to the reality of its backwardness in dealing with

European powers. Besides nationalism and religion taking up the mainframe war theatre, the mental isolation of the Russian state was set in motion.

War for Italian Independence was fought in 1859 with Austria on one side and France under Louis Napoleon (Napoleon III, Napoleon I's son) and Sardinia-Piedmont on the other. Napoleon III was still basking under the glory of victory against Russia in Crimean War. There was great loss of life on either side without any outcome. The Austrian Emperor Franz Josef found it difficult to afford the war. Italian nationalism was on the anvil. Hostilities ceased and Italy was unified with Savoy and Nice going to France.⁴²

The American Civil War started on 12 April 1861. Abraham Lincoln had taken over as President in November 1860. The disintegration was fast. The battle between the Confederates and the Unionists lasted 4 years. It also included pitched battles at sea. The turning point in Civil War came in the Battle of Gettysburg from 1 to 3 July 1863 when the Confederates were routed. When the war ended on 9 April 1865 with victory to the Unionists, it had cost an estimated 618,000 lives. Five days later, Abraham Lincoln was assassinated at Ford's theatre in Washington. The American War of Independence triggered the journey of the USA to the position of a super-power⁴³ today. It took two centuries with a major conflict in between—the Civil War (1861–1865) and exceptional sacrifices by its people. No other nation in the world has suffered so much and at the same time benefited by certain definite advantages—convenience of time for an early start (the early bird syndrome), geolocation, brand new citizens ready for empowered governance and freedom and will of democracy without shackles of ingrained traditions and restless history that fetters free thinking and will to perform. If these are the ingredients to become a superpower, it is not easy for any other nation in the world to place their bet in the roulette machine for the slot of the powerful deposing the USA, whatever the strategic soothsayers may predict. No way! But there is a caution for the USA—history may not believe in miracles; it stores many surprises.

One of the fiery incidents in the history of the USA shows the way the tectonic plates of a new nation settle down. The birth of a nation and its process to a balanced human system may be violent and ridden with trial and tribulations. It took about a century for the USA to settle down (1776–1863). This should give a rough estimate of the natural process that goes on in every nation towards stability. Under the law of invariance, one could see that the natural frequency of the human system remains more or less unchanged, even if the changes on the surface are highly noticeable. Deep under, nothing has changed.

1866 witnessed the Austro-Prussian War. The Austrian troops were easily defeated. It was also called the Seven Weeks' War. Prussia became a dominant

⁴²Microsoft Encarta Encyclopaedia, 2001. In 1814, following Napoleon's defeat, Italy was divided into the Papal States, Austrian duchies, the Kingdom of Sardinia and the Kingdom of the Two Sicilies. In the 1859 war, all the northern part except Venice was unified. The Kingdom of Italy was formed in 1861. Victor Emanuel II became the King.

⁴³Later in the book referred to as a super state.

power.⁴⁴ In 1870, Prussia established its domination over Germany by defeating France in the Franco-Prussian War. The underlying causes of the conflict were the determination of the Prussian statesman Bismarck⁴⁵ to expand France to regain the lost status after the Austro-Prussian War. It was not the way the war turned out for France. Paris surrendered in 1871 when it was under heavy bombardment, and the people were compelled to eat anything they could place their hands on—cats, dogs, rodents... The records speak.⁴⁶ Napoleon III was deposed. Germany was united and William I, the Prussian king, was crowned as the German Emperor.

In 1894, provoked over a dispute over Korea, the Japanese forces sank a British ship carrying Chinese troops to Korea. Korea declared war on China that resulted in the China-Japan War. The Japanese won easily because they were highly successful in modernisation compared to China. Five years later, in 1899 the Boer War broke out between Britain and Boers (Dutch) in South Africa. The war lasted 3 years. President Kruger of the Boer Republic acted to stop the British buying the Transvaal with its gold mines. The Boers slowly lost and sought German support. It ended in 1902 with the Boers agreeing to accept British sovereignty in South Africa.

Within 2 years, in 1904, a war broke out between Russia and Japan that lasted for a year. For the first time, armoured battle ships, torpedoes, battle guns and modern machine guns of the period were involved in war fighting. The Japanese navy bottled the Russians in an attack on Port Arthur in Manchuria, thus instigating them into war. In the end, the Russians surrendered to the Japanese. Peace treaty between Japan and Russia was mediated by President Roosevelt of the USA. There was a mutiny on the Russian Cruiser Potemkin that followed major concession from the Tsar that included a constitution, a parliament (Duma) and grant of civil liberties. However, the Tsar withdrew them one by one in course of time.

The entry of World War I⁴⁷ was like any other war before that. For the war-hardened world, it started as just another war. It was sparked off on 28 June 1914 with the assassination of the Archduke Franz Ferdinand, the 51-year-old heir to the Austrian throne, in Sarajevo. He was travelling in a car with his wife when shot by the assassin Gavrilo Princip. Austria used the assassination as an excuse to declare war on Serbia. The war unlike the previous wars spreads like wildfire across Europe with Germany, Austria and Hungary on one side and France, Russia, Britain and others on the other. Within a year, the war was called the Great War. It involved land, air and naval forces. For the first time, war took to underwater involving submarines.

⁴⁴Microsoft Encarta Encyclopaedia, 2001.

⁴⁵Otto Von Bismarck (1815–1898). Prime minister of Prussia and the founder and first chancellor of the German Empire.

⁴⁶Microsoft Encarta Encyclopaedia, 2001.

⁴⁷A world war is “a war engaged in by all or most of the principal nations of the world”.

In 1918, the Spanish influenza⁴⁸, a dangerous epidemic, spreads across Asia, Europe and North America. It was caused by an H1N1 virus with genes of avian origin. It originated in China and killed 21,640,000 people in a short time. The final death estimate was 50 million worldwide by the time it ended in 1919. 500 million people were infected. It was a horror story played within a horror story and claimed more casualties than war that too within one fourth of the time.

World War I ended on 11 November 1918 with victory to the Allies with the signing of an armistice. The casualties were 40 million. The war officially ended by the signing of the Treaty of Versailles by the Allied and Associated powers and by Germany on 8 June 1919. It came into force on 10 June 1920. The casualties were 40 million.

The World War and the flue virtually shook the world. Under absolute despair and with a view to end future wars and destruction, the victorious allied powers steered a proposal to create a body for international cooperation. It was the first time a joint proposal for collective security action against an aggressor under an international body was mooted. Geostrategic security was taking a turn here towards collectivism by international consensus. The League of Nations was established after the Paris Peace Conference in 1919 that established the League's directing organs. But soon the League of Nations weakened. The primary reason was non-adherence by the USA.⁴⁹

In the middle of conflicts leading to full-fledged wars that have become habitual to humans, a seemingly innocuous incident flared up a conflict into uncontrollable frenzy never witnessed before in human history. It not only brought them close to their original mindset of primates in a reverse order of time but also warned them of total annihilation if they do not behave. For the first time, the humans felt they needed an overseeing body that could save them from themselves. They virtually got scared of themselves. But soon, the product—the League of Nations—was disbanded since the power of war, and self-destruction was overbearingly strong that no human could resist. To think of it all, the mega war of the period was a typical pointer of how clashes within individual human minds can collectively lead to annihilation of the society. The madness did not end there as subsequent events prove. It was only two decades to the next big war that lasted till 1945, the inter-period before the world reluctantly woke up to the reality of war that, in a sense, is yet to be accepted.

⁴⁸Spanish influenza (Spanish flue) did not originate in Spain. The name was a misunderstanding. The Spanish on the other hand believed it came from France and called it French flue.

⁴⁹Encyclopaedia Britannica. Ultimate reference suite. CD-ROM. 2004.

9.5.4 *Inter-period: 1919–1945*

The inter-period 1919–1945 witnessed another world war with advanced weapons and weapon systems including the nuclear bombs. The period was not conflict free. The Russian Civil War had broken out a year earlier (1918) between Bolshevik Red Army and the White Russian Army after many groups formed that opposed the Bolsheviks led by Vladimir Ilyich Ulyanov Lenin (1870–1924) since November 1917. The victory went to the Bolsheviks in 1921 that created the communist Soviet Union out of Soviet Russia in 1922, comprising multiple national Soviet republics, the largest country in the world. Elsewhere in the world, nationalism continued its progress. The Spanish Civil War (1936–1939) between the nationalists (Franco) and the republicans ended in 1939 with victory to the Nationalists.

The same year saw the beginning of World War II. The war started on 1 September 1939 and ended on 2 September 1944 exactly after 5 years. The watershed event of the war came on 6 June 1944. 175,000 soldiers from all over Europe and North America landed on the German-occupied hostile beachfront in Normandy in the northeastern France, travelling 60 to 100 miles by water (shades of the Trojan War?) The aim in invading France was to drive occupying Germans into Germany. It was also the first land conquered by the Nazi’s taken back by the Allies. 5000 ship armada set sail that night from England with 11,000 aircraft flying above. It was a war of a kind that the world had never witnessed before and, perhaps, will never again. It was the single greatest military event of the twentieth century, a study in the deployment of overwhelming force. Casualties were many. US companies that landed at the Omaha beach suffered 90% casualties in 20 minutes. Hundreds of soldiers from their landing craft drowned in the sea in unexpectedly deep waters. Many of the 17,000 paratroopers were dead before they set foot over the land. Some were hanging on trees like paper kites full of holes. The trees dripped blood. So fierce was the German machine gun fire that some personnel of landing craft went hysteric and beat their own captains who were scared to bring their craft closer to land in shallow waters. 10,000 died in initial assault. But the footholds eventually allowed the Allies to march onto Berlin and bring about the end of Nazi Germany.

Germans had a whiff of the landing. Rommel⁵⁰ forewarned that Americans would land there. In the first 2 weeks, the Americans landed about 80,000 troops in Utah beach alone. The 2500 German soldiers kept on them for a few days. They captured 250 Americans before withdrawing to south. Though the landing was the beginning of the end of the war, two nuclear attacks, for the first time in the history of the world, by American bombers devastated the cities of Hiroshima and Nagasaki in Japan. It was live testing rather than decisive attacks to end a world war. The war had already ended by then in favour of the Allies. Along with the innocent civilians, the nuclear arsenal incinerated the psyche of a nation forever and of the civilised world to a considerable extent. The bombs were produced by the Manhattan Project

⁵⁰Erwin Rommel (1891–1944) was a German field marshal, best known for his spectacular victories in the initial stages of the World War II.

(1942–1945) of the US Government. World War II formally ended on 14 August 1945 with Truman, the President of the USA, declaring the War was over. 55 million people died and 10 million were displaced—the greatest casualty ever in a war in the world. The war paved way for the United Nations with intent to stop wars in the future. On 24 October 1945, the United Nations replaced the beleaguered League of Nations as a new symbol of hope for humankind.

World War II re-established the fact that assured mutual destruction and genocide by wars would continue in a human system. Mutual confidence of a nation in another would wane. This assertion was strengthened by the introduction of nuclear arsenal and establishment of the already existing biological and chemical agents in warfare especially in countering asymmetry. It also brought out the story of holocausts and, worse, the fact that there was no value for a human being in a crowd. The most important finding, perhaps would secure the world in the future, was the reinvention of the League of Nations in an entirely different form—the United Nations. Will there be another world war? The question is too old. The world had another, immediately following World War II—the Cold War that again divided the world into two and more or less stalled its order for half a century. That was World War III. The fourth probably is in the making.

9.5.5 Cold War: 1945–1991

In spite of the creation of the United Nations, the wars did not stop, but the world became a better place to live, comparatively. Every war that was fought till the fall of the Soviet Union, thereafter, was in the shadow of the Cold War that lasted till the Christmas of 1991, to state officially.

The first serious war that followed was the Korean War in 1950 between North and South Korea. When Seoul fell to the Communist North Korea, the United Nations asked its members to help South Korea. The USA dispatched air and naval forces. When Seoul was regained, it was found that 80% of the city was destroyed. It was also an environmental war in which the US air force bombed dams in North Korea flooding fields and habitats, causing heavy damage to environment. In 1953, armistice was signed at Panmunjom ending the 3-year war that wrecked the region. North Korean and Chinese casualties amounted to 1,500,000. About two million civilians were killed in Korea.⁵¹ Total estimate was about four million casualties in the war.⁵² It was a war in which the United Nations with the USA was the principal participant. China supported North Korea finally. The war ended inconclusively and established an authority for the USA to intervene in communist expansion under the containment policy.⁵³

⁵¹ Castleden, R. (1994). *World History*. Paragon p. 565.

⁵² Encyclopaedia Britannica. Ultimate reference suite. CD-ROM. 2004.

⁵³ Ibid.

The war brought the newly formed United Nations into limelight increasing its stake in what was called collective military security. The war also established that it would be only the USA that could be taken seriously in any coalition under increased probability of success. For the USA, it was an opportunity to play the game of war and establish its containment policy against the communists. It got an edge over the Soviet Union in the middle of the Cold War.

The USA was soon to experience how treacherous the road to super dominion would be with its entry into Vietnam. A protracted war was fought between North Vietnam and South Vietnam and the USA from 1964 to 1973. On 2 August 1964, North Vietnamese patrol boats fired on the US destroyer Maddox in the Gulf of Tonkin, and after the US President Lyndon B. Johnson (1908–1973) asserted that there had been a second attack on 4 August—a claim later shown to be false—the US Congress almost unanimously endorsed the Gulf of Tonkin Resolution authorising the president to take all necessary measures to repel attacks and prevent further aggression.⁵⁴ The Gulf of Tonkin Resolution, in effect, gave the president the formal authority for full-scale US intervention in the Vietnam War. The USA involvement fanned the fire. The credibility of the USA was at risk more than the independence of South Vietnam. By the end of 1967, there were 389,000 Americans serving in South Vietnam. They could not match the Viet Cong who depended on stealth, concealment, ambushes and other surprises. Casualties mounted. In the USA, there were public demonstrations against war. When the USA announced first withdrawal, there were 540,000 military personnel in Vietnam. By late 1970, the number of US military personnel in South Vietnam had been reduced to 335,000. The peace talks did not progress well. The US Congress denounced further US military activity in Indochina against the background of humiliating defeat in Vietnam. The war ended with the surrender of South Vietnam to North Vietnam. A military government was instituted. On 2 July 1976, the country was officially united as the Socialist Republic of Vietnam with its capital in Hanoi. Saigon was renamed Ho Chi Minh City.

The casualties were heavy. The loss for the Americans was more than 58,000 killed in action and by other causes. More than 303,000 were injured. According to estimates, 185,000 to 225,000 Vietnamese were killed and 500,000 to 570,000 wounded. 900,000 troops were killed and an unknown, but huge number wounded on the other side. Civilian casualty amounted to more than 1,000,000. The terrain and its environment were heavily damaged. Much of the population of South Vietnam became refugees. Agriculture, business and industry were totally disrupted. The USA faced a major setback in morale, and its progressive economic programme towards a “Great Society” had been largely halted by the economic and military demands of an unpopular war. The cost of the war has been estimated about US\$200 billion. With the communist victory in South Vietnam and communist takeovers in neighbouring Cambodia and Laos, the new Vietnam emerged as an important Southeast Asian power.

⁵⁴ Ibid.

All these were happening during the Cold War that arose from the shock and delirium of the post (nuclear) world war based on suspicion and fear. Differences in political ideologies raised the level of mutual suspicion. Political instigations of the suspicious governed thinking in the world post World War II. The damage was aggravated by the live showdown of the nuclear arsenal and its capacity to annihilate in World War II. From a particular perception, it may look as a totally unnecessary campaign and perhaps the most foolish act of human race in the whole history (so far) of its existence. World War II had already reached the settlement line after the allies won the war in the watershed attack on Normandy, France,⁵⁵ but declared later after two nuclear attacks on Japan.⁵⁶ The irony of human tragedy is that Hiroshima and Nagasaki were attacked with nuclear bombs⁵⁷ when the allies had already won the war. While the shockwaves and radiation (barring the trauma) of the attacks have subsided in the two cities in Japan, the shock waves of the act will continue to haunt the world for many years to come under various situations and guises. To some extent, it was these bombs that opened up the era of Cold War that brought the world psychologically retarded and withdrawn into the past. The world is now living under fear of nuclear threat, which would have been slightly subdued otherwise. The third nuclear bomb that will explode one day perhaps may be the last. The faithful in the reality of human fallacies is sure that this too may explode without any acceptable purpose.

There is another perception to this, which points out that, but for the act of the USA in exposing the power of the nuclear bomb in Japan, there would have been a more serious and regrettable nuclear showdown somewhere else in later years⁵⁸. The world understood the power of nuclear bombs in mass annihilation after the American action. Today, the world understands that everyone is a loser in a nuclear war. Does this mean war is a surgical operation for a better world, and not plane straightforward butchery? Does it indicate that war is necessary?

The Cold War was long. It more or less stunned the growth of the world, though advanced it technologically quite forward. The Cold War ended in 1991⁵⁹ and along with it the Union of Soviet Socialist Republics (USSR) commonly called the Soviet

⁵⁵ Encyclopaedia Britannica. Ultimate reference suite. CD-ROM. 2004. The invasion was called Operation Overlord. It began on 6 June 1944 (D-Day), and by 25 August 1944, the German forces surrendered.

⁵⁶ Castleden, R. (1994). *World History*. Paragon. p. 553. Harry S. Truman (1884–1972), the 33rd president of the United States formally declared the end of the Second World War on 14 August 1945.

⁵⁷ Ibid. p. 553. On 6 August 1945, the USA dropped a nuclear bomb in Hiroshima, Japan, killing 100,000 outright and another 100,000 in subsequent months from burns and radiation sickness. On 9 August 1945, another bomb was dropped in Nagasaki, Japan. The bomb killed about 75,000 people. Both the attacks were on civilian population.

⁵⁸ This study does not advocate “would have been” or “would not have been” theories as such thinking do not aid decision making.

⁵⁹ Encyclopaedia Britannica. Ultimate reference suite. CD-ROM. 2004. The dissolution of the Soviet Union was complete on 25 December 1991 when the new Russian flag was hoisted in Kremlin.

Union. It was the second major change the world witnessed in the human system besides the birth of nations in 1648.

The Cold War was a war, which too equivalent to a World War with the entire world balanced on one of the sides even when non-aligned. Yes, it was not declared but the shape of things to continue in a bipolar world by balancing itself through conflicts between political and religious polarities both separate but close to each other with other players in between. It is a complex and intertwined network of human systems and faith. The traces of Cold War are still on and will last longer. All the wars that were fought subsequent to the World War II till the disintegration of the Soviet Union were strictly battles to the sense that they were under the shadow of the Cold War between two powers vying for superpower status, seemingly under a law that only one can stay on top.

The wars between Israel and Arab states mainly on Palestinian cause were ongoing in spite of the world's attention on various other wars. The first war immediately followed the proclamation of the State of Israel, on 14 May 1948. Notable wars were fought between the two sides thereafter in 1956, 1967, 1973 and 1982. The 1967 war, known as the Six Days' War, started on 5 June 1967. Within 2 days, the Israelis took control of the Arab part of Jerusalem. Israel did not heed to the UN request to withdraw from the territory.⁶⁰ Besides, it also retained control over the Golan Heights. The war was over on 10 June 1967 with Israeli control on strategic points. On 6 October 1973, Egypt and Syria jointly staged a surprise attack on Israel. It was the Jewish holy day of *Yom Kippur*. The Israeli forces suffered heavy casualties. The army, however, pushed its way into Syrian territory and encircled the Egyptian Third Army by crossing the Suez Canal and establishing forces on its west bank. The Yom Kippur War ended with Egypt's acceptance of the UN ceasefire call on 22 October 1973. It was a war in which both the parties celebrated "victory" at the end in their own ways. Israel and Egypt signed a peace treaty on 26 March 1979, under the Camp David Accords, and formally ended the state of war between them that lasted for about 30 years. Egypt recognised Israel's right to exist. It was a political victory for Egypt and recognition for the UN.⁶¹

In the far away Atlantic, a brief undeclared war was fought between Argentina and Great Britain in 1982 over the control of Falkland Islands (Islas Malvinas). Argentina had claimed sovereignty over the islands since the nineteenth century. Britain had occupied and has been administering these islands since 1833. After an initial victory, the Argentineans were ignominiously defeated by the British in the 2 months long war. Casualties and damages on both the sides were heavy.

⁶⁰Israel insisted that the city of Jerusalem will be its capital and will not be divided since then, whereas Palestinians demand full control over East Jerusalem and its Temple Mount. The war is expected to continue. The Palestinians have another reason for that—to re-inter Arafat (1929–2004), the revolutionary Palestinian leader, who died on 11 November 2004 after dominating the Israeli-Palestinian conflict for nearly 35 years and buried "temporarily" in Ramallah where he spent the last 3 years of life forced to the isolation of his Spartan house by the Israeli forces.

⁶¹Paleri, P. (1993). "An Overview of Military Theories through the Images of the Yom Kippur War". *Research paper* (Unpublished) National Defence University).

There was a prolonged war between Iran and Iraq during the 1980s. Iraqi forces invaded Iran on 22 September 1980 to settle a number of disputes and also with an eye on oil revenue. However, the events did not turn out the way Iraq anticipated. The casualties were heavy. Estimates range from 1,000,000 to twice that number in total casualty. Iraqi forces killed some 100,000 Kurds during the final months of the war. In 1988, Iran accepted a UN-mediated ceasefire. The final exchange of prisoners was not completed until March 2003.⁶²

9.5.6 *Post Cold War*

Even before the formal end of the Cold War, there was an untimely attack by Saddam Hussein's Iraq on the neighbouring Kuwait. The decision was an isolationist thinking seemingly without arguably logical reasoning. Iraq was facing serious economic burden of the protracted war with Iran. It invaded Kuwait on 2 August 1990, with an eye on economic benefits. Iraq had been claiming Kuwait as part of it for a long time. Under the intervention of the USA, the Arab countries took a firm stand against the Iraqi annexation of Kuwait. The coalition forces launched an air war against Iraq and Iraqi-occupied Kuwait on 16–17 January 1991. A ground campaign that began on 24 February secured eviction of Iraq from Kuwait in just 4 days. Iraqi military and civilian casualties were heavy, estimated at about 100,000. Another 100,000 soldiers reportedly surrendered to the coalition forces. The coalition armed forces suffered fewer casualties—about 1500 killed or wounded in action. It was a one-sided war and that too an unfinished one as the later events proved.

The reforms in the Soviet Union were in progress, and it paved an excellent scenario for the USA and its coalition to plan the attack without being cast under the shadow of the Cold War as it was already getting diluted. Only the reassurance was pending, and it had to wait till the fall of the Soviet Union a few months hence.

Against the background of the reforms in the Soviet Union, the long suspected micronisation of Yugoslavia began in 1991. Slovenia and Croatia declared their secession from it on 25 June 1991.⁶³ Battles between Serbs and Croats erupted. Macedonia and Bosnian Croats and Muslims followed suit. As civil war raged, Serbia and Montenegro created a new federation with their own governments under separate constitutions. The civil war aggravated. In the wake of failed international efforts to mediate the conflict and in response to a major Serbian military offensive against the Kosovo Liberation Army, the NATO retaliated in March 1999 with a bombing campaign, prompting Serbian leader Slobodan Milosevic to order a campaign of “ethnic cleansing” that made refugees of hundreds of thousands of Kosovar Albanians. In June, however, a peace accord was reached. A change in the Yugoslav

⁶² Encyclopaedia Britannica. Ultimate reference suite. CD-ROM. 2004.

⁶³ Castleden, R. *World history*. Paragon. p. 621.

government late in 2000 brought reinstatement in the United Nations and the Council of Europe. Nevertheless, agitation continued in Kosovo and Montenegro for independence. The Yugoslav and Montenegrin presidents and the Serbian prime minister agreed to a European Union-brokered accord that would maintain the federal union, but with greater autonomy for each partner. The agreement, ratified in 2003, renamed the country Serbia and Montenegro that effectively erased the name Yugoslavia to the annals of history on 1 January 2003.⁶⁴

The dissolution of the Soviet bloc nations of the Cold War is a proof of the lost time in the Cold War world, and it was also similar to the situation of reconstruction of a post-war world. It is for this reason the Cold war is considered to be another war of total magnitude in this book.

Much before all these, another poignant story of human sufferings was unfolding elsewhere in the world—in Afghanistan, the landlocked country that remained a pawn in the power games of empires for centuries. In 1978, a pro-Soviet government after a coup established a long-term military treaty with the Soviet Union. The Soviets moved in support of the Communist regime that was resisted by insurgents supported by the USA at the helm of affairs through Pakistan who was the major player in the supply chain of weapons, training, sanctuary and intelligence.⁶⁵ It was Guerrilla warfare with ample support from the controlling powers outside the arena. The money came from the USA, Saudi Arabia and other Arab countries. Weapons were bought from China, Egypt, Israel, America and Britain.⁶⁶ The CIA coordinated the entire operation with the help of Pakistan. In spite of the system being riddled with colossal corruption⁶⁷ in the pipeline, the insurgents against the Soviet forces were able to repress them. This was facilitated more by the Taliban, an austere movement of religious students who were determined to establish a theocratic regime (1996–2001) that soon fell under the influence of a group of well-funded Islamists led by an exiled Saudi Arabian, Osama bin Laden. The Taliban regime collapsed in December 2001 in the wake of a sustained US military campaign, post the terrorist strike in the USA on 11 September 2001. Soon thereafter, anti-Taliban forces agreed to a period of transitional leadership and an administration that would lead to a new constitution and the establishment of an elected government.⁶⁸

The Afghan government held power for two decades since then. They abruptly withdrew once the USA decided to withdraw its forces from Afghanistan in August 2021. It gave an impression that the USA and the government in Afghanistan under Ashraf Ghani both were tired and lost direction. According to Ghani, who fled with

⁶⁷ Ibid, p. 97. Washington Post (8 May 1987) reported that they had found CIA's secret arms pipeline to the Mujahideen in Afghanistan was riddled with opportunities for corruption. It further reported that the losers were the poorly equipped guerrillas and the American people whose congressional representatives have been betrayed by the CIA.

⁶⁸ Encyclopaedia Britannica. Ultimate reference suite. CD-ROM. 2004.

whatever he needed, it was to avoid bloodshed, for the USA perhaps a tactical retreat under extreme compulsions of reckless politics it plays. This study observes the whole incident as a revisionist war, though it needs further investigation. If so, there is much to learn from this war that was not a war for assessing the future of the human systems and associated binary polar systems (Box 9.1).

Box 9.1 Revisionist War

The regime was taken over by the new Afghan Taliban that was quite different from the old rag-tag bunch. They were modern and more tenacious,⁶⁹ thanks to its supporters including fund distributors. It will be good for Afghanistan and Taliban if they use this opportunity to change themselves and get into the mainstream governance of their nation. The moment is opportune for it. Both, 15 August 2021, ushered the beginning of a new continuum. Everything about the old is gone. Notwithstanding the internal strife between two opposing factions in one country that culminated in the victory of the old loser, it could be treated more as a revisionist war in which the universal antagonist transformed into protagonist. But how much this aspect will gain currency will be seen in future based on the alliances, activities, modernity, human rights and civility in governance that the new regime will adopt and exhibit in the coming times. It is hard to call it a war as the forces belonged to the same nation. From the point of the previous government, it was more about its failure in establishing rule of law in national security governance.

In between the return of Taliban in Afghanistan, one may revisit Iraq briefly. The USA had an unfinished agenda there. Saddam Hussein survived the previous attack that, according to textbooks, was intended. He was considered a wall by the Sunni world between the Sunnite Arabs and the Shiite Iranians. George W Bush, as the president of the USA felt overthrowing the regime of Saddam Hussein, was not a bad idea in spite of the American differences with Iran. The reasons he put across to the United Nations and universally to the world were counterfactual and unconvincing. However, in pre-emption, the law can be modified to argue that “the one who pre-empt knows why, and though shalt not ask why not”. This is the drawback of pre-emption when the powerful handles it. A failed pre-emptive attack can have serious aftershocks. It will be a colossal failure of power projection. In pre-emption, the people will never know from what they have been benefited. It will be known only to a few. This subject is more on informational security than military security.

⁶⁹Gall, C. “Ragag Taliban show tenacity in Afghanistan”. <https://www.nytimes.com/2008/08/04/world/asia/04taliban.html>. Accessed 15 August 2021.

“Qui disiderat pacem, praeparet bellum”—let him who desires peace, prepare for war—wrote the civil servant Vegetius⁷⁰ in the late fourth century in his *Epitome of Military Science*, the sole surviving Latin treatise on war. In its favoured expressionist form, the term is mentioned “si vis pacem, para bellum” (if you want peace, prepare for war).⁷¹ Vegetius stated that the Romans always kept their fleet at the ready “since no one dares to challenge or harm people they know are fully armed and ready to fight”. It is the oldest evidence in support of preventive deterrence. Pre-emption is a form of deterrence. In pre-emption, the forces are not just ready and projected, but actually attack. It is not a new concept. It is older than the concept of deterrence Vegetius discerned in his treatise. In 424 BC, the Boeotians were expecting an attack from their neighbours, Athens, and contemporary Greek Historian Thucydides (460–400 BC) makes their general, Pagondas, say to his troops, “When one has to think about the safety of one’s own country, calculations about what is prudent does not come into it. Prudence is for those whose country is secure and who are attacking someone else. But the Athenians are the most dangerous of all people to have living next door, and such people will always march out boldly against those who make no move against them but merely defend their own territory. But when someone goes out to meet them and takes the initiative, their enthusiasm for battle wanes”.⁷² That is pre-emption.

The USA and Britain along with a coalition went against Iraq before Saddam Hussein, as stated by them, unleashed a WMD terror in the world. The assault known as Operation Iraqi Freedom began on 19 March 2003. It was swift and Baghdad fell on 9 April 2003.⁷³ That was the end of the three decades of the Baath Party rule under Saddam Hussein. This time the objective was to end the rule of Saddam Hussein. Furthermore, the USA along with the coalition forces achieved it scrupulously.⁷⁴ However, the war opened a stream of stingers that is yet to settle (2021).

Kofi Annan, the then secretary general of the United Nations, has gone on record that the Iraqi War that ousted Saddam Hussein from power was illegal since it was

⁷⁰Ibid. Roman military expert of the fourth century AD, whose writing was considered the single most military treatise in the Western world. His work exercised great influence on European tactics after the middle ages.

⁷²Ibid.

⁷³<http://www.washingtonpost.com>. Accessed 16 November 2003. Saddam was arrested much later, on 13 December 2003.

⁷⁴<http://www.cjtf7.army.mil>. Accessed 16 November 2004. According to the site, the coalition forces as on 8 January 2004 comprised 35 countries, in addition to the USA, have contributed a total of approximately 22,000 troops to ongoing stability operations in Iraq. These 34 are Albania, Australia, Azerbaijan, Bulgaria, Canada, the Czech Republic, Denmark, the Dominican Republic, El Salvador, Estonia, Georgia, Honduras, Hungary, Italy, Japan, Kazakhstan, Latvia, Lithuania, Macedonia, Moldova, Mongolia, the Netherlands, New Zealand, Nicaragua, Norway, Poland, Portugal, Thailand, the Philippines, Romania, Slovakia, South Korea, Spain, Ukraine and the UK. Details were for 9 January 2004.

not according to the UN Charter.⁷⁵ The USA and its allies did not follow the procedures of the UN Charter according to Annan. The US President countered this statement in another session. Annan expected the war was a lesson for the USA and other UN members and hoped that there would not be another Iraq type war. This also shows that the UN cannot exercise mandate under conditions when a superpower undermines its authority. It is a clear indication that the superpower is beyond the United Nations and there are nations that follow the superpower more precisely than they do with the United Nations.

The selective mention of wars so far is meant to indicate the influence of war in shaping human systems. However, the study of war should not be restricted to these examples alone, because every war has its specific ingredients of violence and annihilation besides signs of human evolution though extremely discrete and invisible to a casual observer. No two wars are identical. Does war change the way of life? Or is it the way of life that is changing war? Are wars essential for human intellectual and other developments? Or is the war by itself the way of life for the humans? Will the day arrive when war is no more a reality? Or are wars necessary to be engaged in for a nation in its final settlement of prolonged issues? Are there nations that will never be involved in war fighting in the world? All these questions are important before one concludes on the need to extrapolate on military security.

9.5.7 *Reforms and Interventional Changes in UN*

The first UN intervention in the affairs of war was in the Arab-Israeli war in 1948. UN peacekeeping became synonymous to ceasefire and war prevention interventions of the collective human system. 77 peacekeeping operations have been conducted by UN since then. 14 of them are still ongoing (28 February 2021).⁷⁶ Every member country supports peacekeeping operations wholeheartedly. More than 120 members had already committed their personnel from the military, police and other agencies. Among them, 4061 people died serving under the UN flag. In spite of this, peacekeeping as a term is not defined or mentioned in the UN Charter. The authorisation for peacekeeping is often quoted by experts, as an invisible clause hanging between Chaps. 6 and 7 of the Charter, more euphemistically mentioned as chapter six and half. The importance of the Charter as an instrument of constitution for the world's largest collective organisation lies in the fact that it is still standing strong in spite of the fact that it represents a system that is not a physical system sans a boundary to define it—the global human system. If there is any flaw, it is for the same reason.

⁷⁵ Rajghatta, C. "Iraq War Illegal, Credible Polls Unlikely. Says Annan". *The Times of India*, New Delhi, 17 September 2004, p. 1.

⁷⁶ Wikipedia. "History of United Nations peacekeeping". https://en.wikipedia.org/wiki/History_of_United_Nations_peacekeeping. Accessed 20 July 2020.

UN brought major developments in international law. Its Charter prohibits threatening and use of force in international conflicts. This has made openly declaring wars at will generally obsolete in international relations. Still it cannot be said that the UN succeeded as the harbinger of a warless future. However, there is hope in the UN. There is a chance that the twenty-first century will recycle human hopes to reality. The changes are visible in the UN way of thinking through various reforms. There were many reforms and resolutions in the UN in the past. Two among them are glanced further.

9.5.7.1 High Level Panel on Threats, Challenges and Change (2003–2004)

The high level panel called by the secretary general in 2003 identified 10 threats to peace and security that needed the attention of the UN. They were as follows:

- (1) Poverty
- (2) Infectious disease
- (3) Environmental degradation
- (4) Inter-state war
- (5) Civil war
- (6) Genocide
- (7) Other *atrocities* (e.g. trade in women and children for sexual slavery, or kidnapping for body parts)
- (8) Weapons of mass destruction (nuclear proliferation, chemical weapon proliferation, biological weapon proliferation)
- (9) Terrorism
- (10) Transnational organised crime

All these were contemporary issues that could lead the global communities to conflicts. The secretary general emphasised the report shall lead to a more secure world and urged the members to take them as their shared responsibility.

9.5.7.2 Transforming Our World: Agenda 2030 for Sustainable Development

The Agenda 2030 with its 17 well-defined goals and 169 targets is a takeoff from the Millennium Development Goals (MDGs) of the UN where seven objectives were declared and carried forward from 1990 to 2015. The Sustainable Development Goals (SDGs) are initiated from the confidence gained from the MDGs in spite of invasions and terror modules playing havoc in the world. The period is conducive for development except for the deceleration caused by the pandemic COVID-19 which the world will overcome. The planned progress of SDG can take a hit at the end, but certainly the world needs to avoid war to prevent the SDG crashing from its present

forward progress. This is also one of the reasons in predicting that wars of a serious kind are not likely to be fought in the coming years for a long time.

9.5.8 2021: So, Is War Over?

The last in the plot is item 8 on Table 9.1—“war is over”. It is an adamant quote or wishful thinking where 2021 is taken as the base year to relive a better life world over. Whatever, the idea needs to be exuberantly acculturated by the human system spearheading the unitary civilisation in the onward moving worm tunnel. It is time for the governing systems and types of governments to understand it. If understood, the world could be made a better place still under the vicissitudes of human systems that cannot be avoided. This study believes.

9.6 UN and War

This study does not conclude UN a failure in collective security. The twenty-first century is witnessing determined steps taken by UN towards progressive responsibility among nations to maintain duality life. It will encourage responsible nation systems. The UN has contributed to uplift and provide security to the tired, helpless and emaciated within the constraints and limitations. It has gone through many trials and tribulations that cannot be called failures. The people of the world are feeling more secure and more responsible. This is reflected in their governments too. Ultimately, this growth is what will also reflect in the activities of the UN. The responsible nations with responsible people have understood the fragility of war for dispute resolution.

The United Nations must expand its role and shift focus from the prevention or containment of military conflict to the achievement of comprehensive global well-being by ensuring the satisfaction of basic needs for the poorest sectors of humanity. The UN cannot run as unified nation system, but it can be a collective human system as it is today with equity and equality among nations recognised. It is bound to happen very slowly at a pace which will be governed by the law of invariance and law of limitations of the human system as a whole. The development of UN and the development of the people of the world will have to remain mutually supportive.

9.7 Anatomy of War

War is a structured behaviour pattern exclusive to humans. This provides it an anatomy, if conceptualised into an entity in form and shape. It is an unprecedented violence. It helps humans to gain control over a state and its affairs or settle disputes.

War is a violent human activity that nurtures order and disorder at the same time. The theories evolved from the inchoating thoughts of the intellect, primarily differentiated war from unaccepted behaviour patterns of the humankind to those that are acceptable.⁷⁷ These theories inadvertently justified the act. Justification prevents guilt. Humans need to justify every act that questions intellect without which insanity can surface. Shift the angle; one will see that it is not the level of sanity, but insanity that counts on those who ride the horses of apocalypse. Meanwhile in psychology, justification is called rationalisation; sounds good.

“Bhagavad Gita”, the song of the blessed, incorporated in the great Indian Epic “Mahabharata”, whose exact origin is undated, justifies war as a means of achieving morally correct political objectives, when all other means fail: neither has to feel guilty for killing nor be afraid of death in the hands of the enemy, in a war that is justified. The questions are many. When is the act of war justified? If so, who decides it? War is justified by the inscrutability of human emotions and decided by the one in authority who slips into it.

Military theories evolved over the ages around war. War came first, theories followed. These theories need not be pragmatic ingredients of strategy. War is shaped on reality. It is necessary to think beyond theories while estimating a strategy, to preclude an end defeat in the hands of the enemy. However, the frame for such analysis has to be drawn from the profundity of military theories themselves. The views of individual theoreticians vary. Their applicability as art or science of war depends upon the personal preference of the commander, often based on situation appreciation. Irrespective of personal preferences, theories remained as the concentrated essence of nature, purpose and conduct of war. The theories formulated their thoughts appropriate to the world and period they lived in. They were independent thinkers who understood war. Sun Tzu advocated that war was the ultimate instrument of statecraft and of vital importance to the State.⁷⁸ According to him, it was the supreme art of war to subdue the enemy without fighting. Such a thought of eschewing violence was atypical of the inherent thoughts of wise people of the period. For Sun Tzu, mere numbers conferred no advantage. Moral, intellectual and circumstantial elements of war were more important. Violence, chance and reason formed the Clausewitzian thought. His theories found expression in waging a war more effectively within its nature and purpose.

Antoine-Henri Jomini (1779–1869) was contemporary to Clausewitz. He also belonged to the formative period of modern military thought. Unlike Clausewitz, he propounded the theory of mass force, manoeuvre, decisive points and communication as the most important elements of war. It was the core. The influence of Napoleon Bonaparte and the eighteenth-century warfare on a larger canvas were evident in his theory. Jomini expanded his views subsequently after the Clausewitzian

⁷⁷The Laws of War is the proof of this acceptance.

⁷⁸Clavell, J. (1983). *The art of war by Sun Tzu*. Dell Publishing. p. 1.

influence but did not evolve out of his basic treatment of the subject.⁷⁹ The theories of Jomini and Clausewitz were advocated by Schlieffen (1833–1913)⁸⁰ much later. Even his theories remained fixated with basic treatment of the ground war.

Later day, theoreticians considered war an extreme natural expression of policy. The ethics of war was veiled within the theories. Annihilation became one of the forms of strategy. Statesmen, historians, scholars and military strategists contributed to the theories over the years. However, the essence of the basic theories remained the same. Influence and applicability of these theories and the way wars were fought varied from region to region. It was often difficult to identify a war with another, as they were explicably different in their motives and elements of style, except through the basic theories underlying their very nature and purpose. The style of war was often predominated by the character of the states that participated in it. Irrespective of the period it is waged, war is based on the fundamental principles promulgated by the ancient and early modern theorists. Pattern and style will change. New theories will offshoot from the fundamentals.

There are wars that demonstrate the advantage of defence. There are others where victory was based on offensive tactics. There are reality speculations that wars may not be decisive, and end results may not be proportionate to losses on either side. “Zero casualty” is proved again and again an impossible objective. The world was at war throughout history. It is a continuous affair in the intercourse of human systems. War never stopped with the formation of nation states. In fact, war collapsed nation states. It did not stop in spite of the overriding authority of international organisations like the League of Nations or the United Nations. Some wars (as rationalised) were fought to stop wars! Wars and war fighting have changed; wars have changed lives. However, theories of war are intact. No more new theories are added to those that already exist.

War is regular, destructive and constructive. There is change hidden in every war. It also brings untold misery to humans—physical, psychological and emotional because it is cruelty at its highest order, and once it unfolds, it is sans ethics. War curtails freethinking in a society and armed forces. The purpose of war could be anything. Place them all in one straight sentence; it will read—war is a situation where the old bury the young for reasons not very clear to them. It happened to Priam 3300 years or so back and many who followed him since then.

Wars may be relayed to generations by dormant causes. This also brings out the concept that no single generation can resolve a problem associated with military security from the past. It can only prevent new ones from cropping up. Exploitation of differences remained a good strategy in war especially those related to colonialism and insurgency. Enemies become friends and devils become darlings in coalition

⁷⁹Paret, P. (1986). *Makers of modern strategy—from Machiavelli to nuclear age*. Princeton University Press. p. 172.

⁸⁰Schlieffen, Alfred Graf von was a German officer and the head of the general staff whose plan of attack was later came to be known as the Schlieffen Plan used by the German armies in World War I.

when the ground is common. It is important to understand in national security that it is war that created and continue creating nation states.

9.8 War and Despise: Counter Theory

There were many efforts in the world to stop war between nations. There were people who thought that a common language in the entire world might eliminate wars forever. They felt people were not able to understand each other because of too many languages they spoke. They went to invent a new international language, “Esperanto”, in the early 1900s. Others felt promoting tourism may end war because whom you may befriend will not be the one with whom you may fight. However, in the course of human history, most of the wars fought were between neighbours.⁸¹ Language had shown no connection. But the fact was that there were people who despised war.

There are many notables in the anti-war thoughts. Jimmy Carter, the former president of the USA stated in his Nobel speech on 10 December 2002 that “war could prevent war” argument was wrong. War might sometimes be a necessary evil. How necessary it might be, it was still evil, he said.⁸²

While wars could not be stopped, relief came occasionally in the form of regulations. The subject of regulating warfare was a point of attention of scholars, leaders, diplomats and soldiers for years. The Greeks and the Romans customarily observed certain humanitarian principles, which have become the fundamental rules of the contemporary laws of war.⁸³ Ancient India had seen ethical principles incorporated in war. Scriptures like *Mahabharata* inscribed ethical principles for observation in the battlefield. It is a notable aspect when it is argued that conventional war with limitations of the laws will no more be in vogue. Instead, cheap, unlawful and high casualty armed conflicts will have a say, and armed forces will be strained to the limits. Military security, therefore, is poised to remain at the centre of national security for some more time.

War is not just a combat situation. It is an instrument of national policy. Even a victory in war does not guarantee a political victory. It is won after the battles in the terrains are won by the soldiers. Diplomats and politicians win their battles in their appropriate domains. Sometimes a battle won by the soldiers may not be sufficient for the politicians and diplomats to win the war. It is also possible for politics and diplomacy to turn a lost war into victory. Zulfikar Ali Bhutto of Pakistan did it in the

⁸¹ Blainey, G. (2000). *A short history of the world*. Penguin Books. p. 538.

⁸² BBC World, 10 December 2002.

Indo-Pak War (3–16 December 1971) and so did Anwar El Sadat of Egypt in the Yom Kippur War (6–24 October 1973).⁸⁴

Those who are against war argue that the only war that can be won is the war that has not been fought. Sun Tzu, the war strategist, made the point differently—the best victory is winning a war without fighting. Norman Angell in his book “The Great Illusion: A Study of the Relation of Military Power in Nations to Their Economic and Social Advantage” attempted to prove that military conquest was obsolete. According to Angell, in prolonged industrial wars, everybody loses. Losers lose the most, but winners are no way better. Much wealth is blown up. Many infrastructures are demolished to be rebuilt again. (There is hidden economics here, though.) Many heritage buildings, sites and locations are destroyed. Rule of law is damaged. However, the thought that the wars are important to promote national prosperity was there all the time. It has not changed at all, though there may be a section of society who thinks like Angell.⁸⁵ It is there to see and, if the trends can be believed, will continue for years to come. In today’s war, there are even enrolled children who take to arms.

Commercial prosperity and land acquisition were considered to be the fruits of military power. In his book, Angell puzzled over how pre-World War I pan-German politicians believed that German prosperity required a big battle fleet when the absence of one made no difference to the prosperity of Norway, Denmark or Holland. He looked forward to the coming of an age of rationale statesmanship, when every prime minister and foreign minister would recognise that regardless of the matter in dispute, binding arbitration between nations was a better strategy than war.⁸⁶ World War I was an eye opener for most of the governments, though not wide open. They understood that war was not the means for prosperity. Then, there were wars from World War II to the first one of the twenty-first century against Saddam Hussein’s Iraq and many other imbroglios which are still smoking and simmering (2021). It is doubtful whether the forces appreciate the anti-war theories of Angell.

9.9 War in the Future

This section contradicts the quote in the beginning that is repeated in between—*war is over*. Considering for the time being that the quote is wishful thinking, this study may open an appreciation that war will still continue; it can never be stopped, and if so, how it will be. The problem is that of an atheist who is sure there is no god, but still gets the jitters—by some chance if God is there? So what does one do if there is

⁸⁴ Anwar El Sadat (1918–1981) was the president of Egypt during the Yom Kippur War (war. Zulfikar Ali Bhutto (1928–1979) took over as the prime minister of Pakistan two years after the 1971 war.

⁸⁵ Delong, J.B. “The Great Illusion,” *The Economic Times*, New Delhi, 31 May 2004. p. 4.

⁸⁶ Ibid.

war in the future? War cannot stop only because someone predicted it will not be there anymore.

Many theories may float about the way wars will be fought in the future. What is important is that wars will not be strange for future generation. The trends, barring from that comes from science fictions and fantasy stories, are based on realities. Technology will govern the swiftness of wars, and energy demand will restrict its duration. Reach will be achieved by designing global super weapons instead of fielding the forces from extended territories. The weapon systems may include huge hypersonic drones in all spaces and terrains that will allow the powers to strike at targets from their own territory with lightning speed. Those who rule the terrains from their own space will rule the world. However, there are other ways also to rule the world. They are perhaps better and achievable without damage. Coalition symbols will be flashed on the operation room highlighters for satisfying the international charter in waging wars. The wars will be under coalition. It is necessary for justifying it.

The weapons that achieve in situ killing with zero casualties to own force will be the ones where research will progress. This will involve smart autonomous weapons guided by artificial intelligence and robotics. According to reports, the USA is engaged in the design of weapons of emerging the future under the code name Falcon.⁸⁷ The objective is global reach capability under lethal power. Ultimate responsibility to find a reusable hypersonic cruise vehicle (HCV) capable of taking off from a conventional military runway and striking targets 9000 nautical miles (nm) away in less than 2 h is the ambitious estimate. The unmanned HCV will carry a payload of about 12,000 lbs and could ultimately fly up to 10 mach (ten times more than the speed of sound). The global reach weapons system will rely on expendable rocket boosters known as small launch vehicles that would take a warhead to space and drop it over the target. The warhead is known as Common Aero Vehicle (CAV) an unpowered bomb, which would be guided on to its target. CAV could carry 1000 lbs of explosives, but at those speeds explosives may be unnecessary. A titanium rod will be able to penetrate 70 feet of rock, and the shock wave would have enormous destructive force. It could be used against deeply buried bunkers. This is just a glimpse. To remain in the apex of military power will be the effort of superpowers and those who aspire for it. It is for the governments to decide as maximisation of military security can impact on other elements of national security. The trade-offs need to be carefully evaluated.

Vladimir Putin, the president of Russia, revealed the idea of a new super missile plan with nuclear warheads in an announcement in 2004.⁸⁸ It seems to be Russia's answer to the US plan to acquire a new nationwide ballistic missile defence system. Putin's idea could be to find systems that can penetrate such defence systems. The

⁸⁷ Guardian News Service. "US Plans Global Super Weapons." *Hindustan Times*, New Delhi, 2 July 2003. p. 12.

⁸⁸ Eckel, M. "Putin Reveals Nuclear Super-Missile Plan." *The Asian Age*, New Delhi. 19 November 2004. p. 5.

new system could be mobile versions of the Topol–M ballistic missiles or the Bulava intercontinental ballistic missiles. The missile could both be sea-based and land-based. Russia has to considerably increase funds for defence and defence research to keep pace with the USA, if that is the idea. It also points out development of hypersonic flying machines able to manoeuvre between space and air space (twin terrain principle, similar to the amphibious), as Moscow's reaction to the US defence plans. Washington had withdrawn from Anti-Ballistic Missile Treaty (ABMT)⁸⁹ in 2002 in order to develop nationwide missile shield. Russia has seen it as Washington's bid to build low-yield nuclear weapons. Well, politicians speak loud when power has to be projected rather than developed—which is part of power projection strategy. However, the conclusion is that the race is on and may not end on the simple principle of filling the gap left by the advancement of others. It will be to widen the gap. Such dictums are part of military security. It costs money, though.

There are reports of Putin unveiling Russia's super weapons, to "make other's listen", in a state-of-the-nation address before the Russian law makers and senior government officials in 2018. He claimed that Russia was working on a host of new nuclear and other advanced weapons including new nuclear tipped cruise missiles with unrestricted range.⁹⁰ The question whether this will heighten the tensions between the two superpowers or will balance the flex between the bipolar global power systems is something to be studied under the power polarity principles mentioned in this study. It also gives a hint on the poles the political power axis bears at the moment more realistically though there will be others vying for taking their positions. In that case, they also need to count on maximising their military security which in every respect is based on advancement in technology and strategic premising of the future power games at the moment.

Many extreme weapons are being attempted. Smart weapons, another name for precision and, at the same time, deadly-to-target weapons are chosen by the powerful to avoid misfire deviations or collateral damages to non-targets in the vicinity of attack. However, the hidden political psychology may be to attack and finish fast before the next election or to optimise the cost and time of war. The future wars may be speedier with smart weapons. Naval warfare may find ships that are difficult to locate by radar like today's stealth aircraft. The sensory signatures will be minimised by special design—with deadly weapons that can target anywhere in the world, sensors and fixtures cocooned inside and opened out only at the time of attack. The ships will be camouflaged and insulated from every detection system—air, surface or underwater. The aircraft will be unmanned, and they will become more lethal and transform into micro aero vehicles (MAV) under nanotechnology. Serious research is understandably on electromagnetic pulse generators that can upset anything

⁸⁹The ABMT is the product of Cold War between the US and the Soviet Union. Strictly it is an instrument of the bipolar world. The ABMT of 1972 limits strategic ballistic missile defence systems.

⁹⁰Trevithick, J. "Here's The Six Super Weapons Putin Unveiled During Fiery Address." 01 March 2018. <https://www.thedrive.com/the-war-zone/18906/heres-the-six-super-weapons-putin-unveiled-during-fiery-address>. Accessed 26 July 2020.

normal—from transmissions to the entire cities—and ante-matter devices many times deadlier than the deadliest neutron bombs. The latter will pale a nuclear bomb into a Stone Age tool. In the development of human offensive behavioural traits, the question is not “what next” but “what beyond next”.

Space-based systems will be able to strike any place on earth at a moment’s notice. The CAVs will deliver weapons to a target of 3000 miles away that may include even deeply buried bunkers. Hypervelocity rod bundles could hit targets on earth from space. Deadlier than all these weapons from space is the laser engagement systems. That is not restricted to outer space alone. The system includes airborne, land-, ocean- or space-based lasers in conjunction with space-based relay mirrors to project different laser powers and frequencies to achieve a broad range of effects from illumination to destruction. Meanwhile, the asymmetry between the good and the bad will continue with advantage to the good. However, the bad and the ugly may get access to lethal and potent weapons. The proxy wars and asymmetrical wars will continue. Military security will be worst hit in proxy war.⁹¹

War in the future will not only be dependent on smart autonomous weapons but also advanced domain awareness in all the terrains where wars will be fought. This is a hypothesis (Box 9.2). Every identified terrain of national security where the game of governance will be played and integrated will have potential domains whose continuous awareness will hold the key for the application of the weapons. This is not for this study to examine but observe the way the national governments will engage in and predict the tendency of war in the future. Right choice of terrains and the respective domains of military security will turn out to be a matter of serious study.

Box 9.2 Stones, Sticks and Microwaves: All in the Same Conflict?

Any predictions about the future wars could go for a toss under the law of invariance subject to the law of limitations. Military weapons are more about modern competitive business; tactics applied depends upon human senility of the moment in conflict resolution. Even commenting on them can be an insult to survival intellect. The nuclear weapons are in the arsenals and quivers since 9 August 1945. It was not used even to kill a mineral rock homing towards the Earth from deep space. It could happen, though; hence it need to be kept as a tool, not as a weapon of war. Chinese and Indian soldiers fought brutally to their own deaths with stones and sticks like Neanderthals on 15 June 2020 along the border. This was the second encounter under extreme restrictions

(continued)

⁹¹In a speech by A.P.J. Abdul Kalam, then president of India, PTI News Scan, New Delhi. 10 December 2002.

Box 9.2 (continued)

since 20 October 1975 on the border. Along with came the news that China used the most secretive and advanced microwave pulse weapons to cook and disorient Indian soldiers.⁹² India denied it. However, the thought process of humans towards conflict situations is very primitive. That says it is all about human tragedy and mindset even in the most advanced century of the survival span even in relatively advanced societies.

9.10 Cost of Military

While the future war scenario is based on cost for efficiency, the cost of military, historically, has been one of the cases of “tail, chasing the dog” for most of the countries. The expenditure incurred by some of the countries in war fighting is mind-boggling. According to reports, from 1991 to 2001, Sri Lanka spent more on defence and war than social services like health, education (informational security), and rehabilitation, poverty alleviation and reconstruction put together. The study was conducted by Lankan economist Muthukrishna Saravanathan. Defence expenditure in Sri Lanka was more than that of other South Asian countries barring Pakistan and those facing similar insurgencies—Colombia, Myanmar, Philippines, Sierra Leone, Sudan, Uganda, etc.⁹³ In 1991 and 1994, social spending was equal to military spending, and in 1992, it outstripped military spending by 1%. Defence expenditure skyrocketed from LRs.16 billion in 1991 to LRs.77 billion in 2000. Defence expenditure began to outstrip social expenditure from 1995 onwards. The actual expenditure on defence could be more than this because large areas are unaccounted for. These are the secret payments to auxiliary paramilitaries, diversion of funds meant for civilian use and the absence of open tender procedures in military procurements.⁹⁴ Sri Lanka’s defence expenditure is significantly higher than its competitors according to Muthukrishna.⁹⁵

The price of war is different from its prize. Both may not coincide and cannot be equated. According to a report based on the Iraq War 2003, the USA would have handed over every Iraqi a cheque for US\$4776 or eight times that country’s average income—with what it spent on Iraq as on June 2004.⁹⁶

⁹²“Fact Check: Did Chinese Army Use 'microwave Weapons' Against Indian Soldiers At LAC?” <https://www.republicworld.com/india-news/law-and-order/fact-check-did-chinese-army-use-microwave-weapons-against-indian-soldiers-at-lac.html>. Accessed 24 December 2020.

⁹³Balachandran, P.K. “Lanka Spent More on War than Social Services.” *Hindustan Times*, New Delhi. 8 December 2002, p. 11.

⁹⁴Ibid.

⁹⁵Ibid.

⁹⁶Fram, A. “A US\$119.4 b Splurge.” *The Economic Times*, New Delhi. 3 June 2004. p. 8.

The cost of war is increasing at unimaginable proportions, and if the trend continues, it has to stop becoming a tiny fraction of the spending as it is now. While spending on war, it may not be useful to think in terms mentioned above—how much one could give free to people, etc., since the purpose of spending is different. Looking at the opportunistic cost of war is not a convenient theory. It has to be value based. War generates money in an overall assessment, especially future money as calculated by some. For others, war destroys money, the past, current and future. The cost value, therefore, has to be seen separately for each nation for each occasion. The estimated cost of wars for the USA was as follows:⁹⁷

• World War II	\$5 trillion
• Vietnam War	\$623 billion
• World War I	\$613 billion
• Korean War	\$471 billion
• Iraq War	\$119.4 billion (sanctioned)
• Civil War	\$74 billion
• Persian Gulf War	\$4.7 billion

The amount includes all expenses. The pinch of money that matters in war expenditure is not what it would have done otherwise in related terms, but how it would have reduced the annual deficit, a key factor in deciding economic security of a nation. If it supports deficit reduction by spending, it is a sign of go ahead from the point of economic security. For the USA, unlike any other nations, military spending has been a means of wealth generation. In 2002, the five permanent members of the United Nations' Security Council accounted for 90% of arms deliveries to the Middle East, Asia, Latin America and Africa. They are the world's biggest arms merchants. Their share in percentage is as follows:⁹⁸

• United States	41
• Britain	19.5
• Russia	17.5
• France	7.6
• China	4.7
• Others	10.1

Seven developing countries spent more on military than on health and education combined. The percentage in GDP is as follows:

⁹⁷ Ibid.

⁹⁸ "Military Spending." *The Hindustan Times*, New Delhi. 24 June 2004. p. 2.

• Myanmar	2.3
• Sudan	3.0
• Pakistan	4.5
• Syria	6.2
• Brunei	8.1
• Oman	12.2
• Eritrea	27.5

The world arms spending crossed the trillion dollar (US) mark in 2004. Probably, the “war on terror” by the USA after the terrorist attack on 11 September 2001 boosted spending on arms. The estimate of global military spending was US\$1035 trillion in 2004. That is US\$162 per every human on earth—the cost to kill or die prematurely by a weapon. The spending on arms was US\$953 billion in 2003. The statistics is based on a study by the International Peace Research Institute (IPRI), Stockholm, Sweden.⁹⁹ It is evident that the preoccupation of the world with military security will continue at least from the market games of arms business alone

Calculating the cost of war is like estimating the coast of a major disaster prior hand. Accuracy will be at stake. A letter appeared in the Friday Times, a newspaper published from Pakistan highlights the issue.¹⁰⁰ The writer was descriptive about the heavy price Pakistan was paying for its obsession with India and the nuclear programme against this background. He was critical of the government on pursuing a policy that was destructive while the Pakistanis were badly in need of employment, schools, hospitals and rule of law. According to him, the politicians and uniformed personnel had a different priority. In more than half a century of its independent existence, what Pakistan had was sophisticated military wares and accumulated US \$37 billion external debt rooted in defence procurement. Pakistan conducted six nuclear tests in 1998. According to the US Nuclear Study Project, the average cost of a bomb is US\$5 billion. Other data put together by the Brookings Institution, the IAEA, and the Institute for Science and International Security that Pakistan’s expenditure should have been about US\$300 million to US\$400 million a year over the two decades (1980–2000) to operate and maintain some 22 known nuclear-related sites.¹⁰¹ The cost did not end there. Nuclear bombs breed delivery vehicles, again a costly affair. The writer was critical about the acquisition programmes in addition to nuclear programmes. According to the estimate, the money spent on acquisitions could provide food, cloth and shelter to impoverished children, 12,000 schools every year, 20,000 additional teachers, educate three million people or 2000 medical care facilities every year. The letter may be

⁹⁹“World Arms spend \$ 1 Trillion.” *Hindustan Times*, New Delhi. 8 June 2005. p. 19.

¹⁰⁰Hussein, Z. “Letter to the Editor, Window on Pakistan.” *Times of India*, New Delhi. 6 April 2001.

¹⁰¹Ibid.

Pakistan specific,¹⁰² but the cost of war and military preparations are applicable to all.

The cost of war is not in terms of money alone. There are also social aspects that need to be seen. It is interesting to note that less secure nations have larger and more authoritarian leadership with higher powers vested in them. Whereas in more secure nations the military is one of the instruments of power projection in geostrategic context. The military supports the government policies unlike a militia who “influence” the government or act as the government itself. Such social systems prevent nations from becoming more secure by self-capping growth. The weapons wielded by the military in a country and the influence it has over its own people and government are also indirect indicators of the NSI. All said it is important to understand that the cost of military is not the cost of national security (Chap. 27).

9.11 Value Engineering Military

It is generally assumed that military expenditure will damage a nation’s economy. It can, but need not be so, unless planned ineptly and implodingly into economy which majority countries fall victims to. In fact, military expenditure can be very productive and support economic escalation if planned competitively. The USA is an example of how military production and growth can not only make the country a superpower but also super rich. It was in the 13th position economically prior to World War II. The country became the world’s largest economy after the War, the position it still retains, in spite of the fact that it was not initially involved in it. The resolution to enter the war and strike it rich had well-planned economic thoughts behind them. The country had engineered the value with the desired political and strategic acuity prior to entering the stage of combat. In 1943 and 1944, the USA succeeded in building a military economy by retooling existing industries. The quantum production was more than that of its allies and enemies combined. Military economy and war economy are different terminologies (Box 9.3) in military value engineering.

¹⁰² But Pakistan is not a country that has to be seen as an economically failing state. On the contrary, it has been quite progressive and has been striding comfortably in every field since independence with India, it’s partitioned other half. Its economy grew by 8.35% against the target of 6.6% in fiscal year 2004-2005. It is an amazing feat. It is an indicator of economic security based on governance—implementation of reforms. The agricultural sector grew by 7.5%. Large scale manufacturing sector registered a growth of 15.4. Services sector attained 7.9% growth. The country also expects its per capita income to go up. Zaidi, M. “Pak Economy Also Shining.” *Hindustan Times*, New Delhi. 18 May 2005, p. 16.

Box 9.3 Military Economy and War Economy Are Different

Military economy is the economic impact of military revenue and expenditure, whereas war economy is the impact of war expenditure and associated revenue on military economy and remains as a part of military economy. Military economy is an ongoing long-term economic process and planning crossing over governments, whereas war economy is short term and exists during the period of military operations.

Value engineering is also necessary in other-than-war situations in military security. The necessity of value engineering in military security is to maximise returns in national security from economic spending on military and military aspects. Value engineering is not cutting down cost but increasing the value per cost. Money is necessary for establishing a military and preparing it for combat. The cost of war when engaged is extra. War is a well-thought-out activity. The return from war is to be examined professionally before spending money on it. The choice of having bases elsewhere or having weapons or forces is a cost-benefit problem. The USA has over 700 military and overseas bases in more than a hundred countries.¹⁰³ Military to military interactions to develop interoperability is fostered by certain nations with other governments for reach and improved capabilities to fight wars in distant lands. In the past, it was based on mobility alone.

Though value engineering is a business and management tool, a value-engineered and constantly reviewed military may be the optimum for a country. It is also necessary to see that it performs optimally and does not remain static or distended after it has been created. A military is static when it is non-performing, underperforming or riddled with human problems and command and control issues. It is distended when a person in the military is not performing militarily.

This study identifies five types of values:

- (a) **Cost value** Cost value is the cost of creation. A military is costly. Therefore, it has to be designed to be optimal for the cost the country can afford.
- (b) **Use value** Use value is the purpose of creation of the military. The objective is to maximise use value of military in war and other-than-war situations.
- (c) **Esteem value** Esteem value of a military is in its geostrategic power projection, static or dynamic. Here the element of military security merges with geostrategic security.
- (d) **Exchange value** Exchange value of a military is when it serves the purpose of geostrategic relations such as peacekeeping operations, coalition involvement in wars, regional conflict management operations, humanitarian intervention and support to the global community in specific situations, etc.

¹⁰³ Bhagawat, V. "Changing Nature of Warfare." *Aerospace and Marine Warfare*, Vol. 1, Issue No. 19, 3 October 2004, pp. 15–16, 18.

- (e) **Environmental value** Environmental value is also the value of sustainability. The expenditure on military should not damage the environment by military operations including exercises and experiments. Problem with war and military is that they can heavily damage human environment.

The value of a military is not in numbers, weapons, equipment or the tricks it can play like a roadside monkey. Its value lies in what it does and how it is done in the interest of total national security. Value engineering military can support a healthy military economy for a country by effective alignment with economic security.

9.12 So, What Is Military Security?

Military security, in this study, is the original and earliest element of national security. It is the first and foremost identified element of national security in the chronological hierarchy of 16 elements. Military security, “milsec” in short with the allotted symbol “ m_{s1} ”, is traditionally the earliest recognised form of national security when the concept was primarily physical security of the human system and its members.

Military security implies the capability of a nation to protect and preserve itself from aggression of any type against its sovereignty with the use of military and other armed forces. This study does not consider military power as the national power as considered by many human systems historically, but a supporting parameter of national security.

9.12.1 *Definition: Military Security*

Against the background of this study, military security means *the capability of a nation to inhibit, suppress and deter alien invasions applying the might of its military and other armed forces with due reverence to international law, including laws of war, when other instruments of national policy fall short to protect the legitimate and responsible security interests and intent of the nation in maximising national security, perfectly aligned with the other elements of national security and integrated with all the terrains of national governance.*

9.13 Summation

War explains several patterns of human behaviour. War is an indicator of human mental evolution, changing with advancing time in collective interactive living. The needs and wants of humans clashed all the time at random intervals in varying

fashions. The singularity of human collectivism often turned to the differentiability of separatism and further to insularism in selective systems. Humans cannot learn the lessons from the past easily. The law of invariance and the law of limitations restrict it. Therefore, appreciation of change takes time. There are trends that awareness is dawning among humans that war and military are not everything for human survival among the odds of life's existential drudge. What happens to individual humans also happen to humans in groups, or group humans. The individual human thus becomes a biomodel to understand the behaviour of individual groups. Humans attempted to resolve their perceived issues in the past through war and conflicts but have not been able to achieve any sustainable solutions favouring future generations. The war and military campaigns thus became the antithesis to war itself. Wars are not totally eliminated. But still the author's quote "war is over. . ." can hold ground when the world goes through a psychological make over unlike in the past. Such make over, if ever happens, could also turn around as an induced hypno-conditioning. It can wear out fast. Humans may still think the route to supremacy is only destroying the other.

In this context this study considers military security as the foremost element of national security but not national security by itself as believed to be. It is one of the 16 elements of national security identified in this study that has to perform jointly by alignment with each other inclusively and integrated with the appropriate terrains. To that extend the idea of military security turns around in a new profile. Even if war continues, the purpose of it will defy logic of traditional objectives of holding the ground by annexation. Nations still prepare for war as a continuing paradigm. The nature of war is expected to change. Maintaining military armed forces for jobs lesser than the cost of their maintenance is not justified in national security governance. A military is an expensive proposition; it should have value-based assessment. Military security, therefore, is important to the extent that it has to be ensured in case there is a serious activity that is beyond the capabilities of other services or organisations in the interest of national security.

10.1 Introduction

The money that passes through a thousand palms behaves in a thousand ways. The “money on the move” that surges over humps and shallows of the economic track may realise the patterns of its flow better than the holders. It was mentioned in a 7th grade (standard) lesson titled “*The journey of a rupee note*”, in a textbook the author studied in 1957. The lesson was a kind of autobiography of an Indian rupee. It

covered the life of a fresh rupee note sentimentally growing old before being bundled and thrown into the furnace “alive” without warning, torn and soiled, at the end of its journey. It was a heavy lesson for an 11 year old who since then has been looking at every currency note that passes through his hand with a bit of sentiment over the martyred protagonist 64 years ago. “Isn’t it a kind of monetary holocaust of a thing used and abused by people all along?” the school kid in the author still asks.

The currency, in any currency system and in any form, is nervous before getting into another hand. There is uncertainty about where it will go next from there. There is a lot to learn from the journey of any currency note anywhere in the world—from where the money comes and to where it goes. Imagine what the money will feel before it leaves a point of outlet for a point of inlet every time. Will it be similar to an unfortunate Yazidi lady in the dark sex slave market or a footballer moving from one club to another? Money watch is also a favourite activity of the people in intelligence who snoop on others.

The narrative in the 7th grade lesson pitches more about the a solitary denomination note,¹ that every currency has a life span; it goes through too many ordeals; its value changes while moving from palm to palm; the faster it moves, the better is its value appropriation; everyone wants it; it can make or usurp the social system; it helps to meet the needs and wants within limits; it supports charity; it supports crime; it can abuse life; it can provide confidence; it induces security feeling; it deprives life in absence; it can regenerate; it’s a barter of convenience; it can be cloned by counterfeiting; it can fake; it behaves like the holder; it changes the behaviour of people; it causes fluctuations in thinking and decision making. . . Oh, God! Even thou art crazy about it!

Money controls the sapien life in many formats: paper, plastic, metal, holdings, credit, virtual.... Can there be more avatars?

Economics for many is about the production, distribution and consumption of resources. However, that alone is not economics. Economics also deals with wealth: wealth generation, wealth retention, wealth distribution and wealth regeneration and everything in between in a cycle. The term economics is not easy to define wholesomely. The definer too is influenced by it. Definitions of economics are actually the curtailed versions for this reason. That is also the reason the subject is perceived differently in different human systems. The subject of economics controls governance in national security. Economic security in national security concept is an element which would have been the first one that people felt primordially if they were not scared to the bones physically by the scary oddities of nature. It was economic security even in barter systems years before money, the instrument of convenience barter from full to the bit, appeared on scene.

¹The Indian 1 rupee note is the smallest Indian banknote in circulation made up of 100 paisa in the decimal system and the only one being issued by the Government of India, signed by the finance secretary, as all other banknotes in circulation are issued by the Reserve Bank of India under the signature of the Governor of Reserve Bank based on the single rupee.

Metal money in raw form replaced the original barter system for necessary means of life. It all began by around 5000 BCE. Since then, psychonomics² (Paleri, 2007)—the psychological way people valued money—drove human behaviour considerably. Psychonomics existed also when people bartered goats for spouses before hard money came. Yes, there is a pun. Money became the symbol of security and happiness unwittingly, though it has serious limitations in security identification. People got engaged in the art of making money and spending it in search of security and that extraneous feeling they call happiness. Today, studies prove that money is not a guarantor of security and happiness. However, people are reluctant to buy this theory. The reason is that actually what the humans want is power, which they do not accept expediently. Moreover, the base or the centre of gravity of power is money. There are many ways to hit at the centre of gravity to deprive one or a system off power. One of them is to rely more on barter of the appropriate kind and eliminate money in the chain. In every attitudinal manner of humans, there is money in one form or another in the psychonomical convictions and aberrations. Even the dead needs money; who says one needs nothing after death?

The element of economic security evolves from these basics continuously. Economic security sprouts from the aspect of life where money is symbolic to security.

10.2 Economic Security: Setting

There could be differences in considering economics as a separate element of national security. Some may consider it as an objective of national security. Here, it is considered an element, because it fits correctly within the parameters including compatibility with other elements. It is this explicit interactive capability of economics in everything that humans do (look at blood money that can step over law unless it is law) that is misunderstood as an embedded objective of national security rather than a standout element. While considering economic security as an element, it means a nation does not have to use its military to ensure it (Box 10.1). It is contributory rather than attributable. It means using the military to gather wealth is not an idea that will guarantee wealth sustainability. This is a statement to drive home the idea of economic security as a standalone but mutually inclusive element of national security.

²A new word that is necessary to explain that the way money behaves has a lot to do with the behaviour and personality of the holder, whether an individual or a group. The term was introduced for the first time in Paleri, P. (2008). *National security: imperatives and challenges*. Tata McGraw-Hill Publishing Company Ltd. p. 154. Psychonomics as a word already exists in experimental psychology dealing with an approach that aims at discovering the laws (*nomos*) that govern with the working of the mind (*psyche*). In this study, it is the way money behaves in the palms of a person based on his or her personality as a behavioural aspect.

Box 10.1 Why Saddam's Military Marched into Kuwait?

The fall of Saddam Hussein (1937–2006)³ can be attributed to many factors. Among them, according to the author, one was his attack on Kuwait on 2 August 1990. The invasion was over in 2 days. Iraqi forces occupied Kuwait for 7 months. In fact Saddam won; he got what he wanted—money, a lot of it. His wallet had hit the bottom after the 10-year war with Iran. However, the attack on Kuwait unwittingly proved to be his nemesis later.

Economic security will best be understood when the objective is stated. The objective is eliminating economic insecurity, period. Economic insecurity is a better understood term. It is that droopy feeling of wealthlessness. Economic insecurity can be felt by the human system and individual human in different ways. Lack of money, absence of means of making money, risk of losing money, losing money, heavy expenditures, losing employment, income volatility, downward mobility in social life, health issues, etc. create the feeling of economic insecurity in today's world. One has to experience it to understand it. They apply to nations too. This causes stratification of people in society and nations in international system. Handling such scenario is part of governance. That means governing for national security leveraging on the element of economic security. Economic security is not normally a term used in individual or personal finance. It is a system term for a larger package in which everything related to economic objectives can be stuffed. It ultimately aims at making a nation economically strong and competent for global participation carrying its people. In the conventional outlook, economic security as an objective is provided by war, public or private economic measures, etc. As an element, economic security is a provider of war and private and public economic measures in its interactive matrix with other elements. There is a change of role.

Money is critical to power acquisition. It means economic security contributes to national power. The mad rush for money by any means among individuals and organisations proves it. Money drives crimes and impacts rule of law in a country.

It is necessary to see power in relation to military security on one side and to the international rating of the nation in its economic capabilities and bargaining power on the other. The behaviour pattern of an economically weak nation in relation to its military interests in a self-destructive manner has been diagrammatically explained in Chap. 6 along with the concept of EDS (economic defence spending).⁴ It is an

³Saddam Hussein Abd al-Majid al-Tikriti (1937–2006) was the president of Iraq in 1979–2003. He was overthrown by the US-led coalition forces in 2003. He was tried and executed by hanging.

⁴Think of North Korea alias Democratic People's Republic of Korea (DPRK) or the quote attributed to Zulfikar Ali Bhutto, the fourth president of Pakistan from 1971 to 1973: "We (Pakistan) will eat grass, even go hungry, but we will get one of our own (Atom bomb).... We have no other choice!" <https://www.goodreads.com/quotes/816223-we-pakistan-will-eat-grass-even-go-hungry-but-we-will>. Accessed 18 August 2020. There are continuing noises and call from Pakistan to its governments to equip itself militarily from the citizen fold too. "Will eat grass but raise Pakistan Army budget says, Shoaib Akhtar." <http://www.coastaldigest.com/sports/will-eat-grass-raise-pakistan-army-budget-says-shoaibakhtar?page=1>. Accessed 18 August 2020. These are direct admissions

ideal situation to explain the relationship between military acquisitions and economic relations. The concept is applicable to every nation unless military spending is affordable and productive in relation to industrial and technological advancement. Such situations arise only in the case of a limited number of advanced nations. For any other nation, the value of EDS has to be calculated by specific studies according to economic conditions and military requirements. Defence expenditure above the EDS will cause serious dent in economic security.

The term “economic security” has not been taken seriously in the past even in the USA where the concept of national security has been talked about much before other nations started even pondering on it. The reasons attributed by Romm⁵ were that perhaps it could be because of the natural growth in economic power as well as economic independence was taken for granted for much of the US history. It was not so with other countries especially with the developing nations who care for large military. It was the fall in economic strength that was taken for granted. Weaker nations counted more on military security than economic security and became economically weaker in the process. Both these elements are mutually depended to such an extent that an increase in one may reduce the other.⁶ In the USA, Dwight D. Eisenhower (1890–1969)⁷ understood the economic dimensions of national security and considered money spent on arms might be a waste. According to him, national security required far more than military power. He felt economic and moral factors played indispensable roles.⁸ Eisenhower perceived the nation’s strength and security should be based on a fine balance between its economy and its military capabilities. He identified economy as a strong supporting factor of national security.⁹

The economic problems faced by a nation include retarded economic growth, higher costs of industrial production, unemployment, deficits, inflation, etc. A stable economy growing at natural pace is essential for economic security. Economic strategy is an integral and essential part of national security. Economic security concept urges creating knowledge-based economies. In 1985, the US President’s Commission on Industrial Competitiveness put it as, *the degree to which a nation, under free and fair market conditions, produces goods and services that meet the test of international markets while simultaneously expanding the real incomes of the*

by responsible people that increase in military expenditure can bring down economic security. But it need not be true always.

⁵Romm, J.J. (1993). *Defining national security—nonmilitary aspects*. Council of Foreign Relations Press. p.51

⁶It is also an inherent relativity aspect of all the elements of non-military security with respect to military security, though to a lesser degree.

⁷34th president of the USA.

⁹Ibid.

citizens.¹⁰ This idea also underpins economic security as an element of national security.

The world was never economically secure. It will never be. One of the reasons is that the economically secure condition is not definable. However, it can be assessed with respect to situations as a feeling. The government is the most competitive agency to take the final call on economic security with respect to a particular scenario because it is its decision that will reflect in national security governance under accountability to the people and itself. There are many metrics to assess economic security and economic well-being of a country and its people today.

The pangs of economic depression, recession, inflation, panic and stagnation were always around the corner. Until the nineteenth century, economic fluctuations were largely connected with shortages of goods, market expansion, and speculation as in the incident known as the South Sea Bubble (1720) when stock speculation reached panic proportions in both France and England. Panic in economic term means acute financial disturbance such as widespread bank failures, feverish stock speculation followed by a market crash or a climate of fear caused by economic crisis or the application of such crisis. . . . Panic is applied only to the violent end of financial convulsion and does not extend to the whole period of decline. Panic in the industrialised societies of the nineteenth and twentieth centuries had reflected the increase in complexity of advanced economies and the changed character of their instability. The greatest panic was, however, the crisis in 1929, which rocked the US economy, shattered world economic relations and brought about the Great Depression. In Keynesian economics, when effective demand falls short of productive capacity, the result is unemployment and depression; when it exceeds the capacity to produce, the result is inflation. Ideally, more money chasing fewer products is inflation. There is a demand pull when aggregate demand exceeds aggregate supply. Recession surfaces when less money chases more products. There is a drop in spending when the aggregate supply exceeds aggregate demand pushing it away. Both are minute-to-minute possibility in a precariously perched world economy that is dangerously cross-border even in the days that were not declared global for economy. Money, as a matter, is always global. In a world that has zero tolerance for eternal insularism, the butterfly effect¹¹ in economic upheavals is much more serious than in weather.

Associated with economic insecurity is the practice of economic warfare. The term is old and to some extent a misnomer. Whatever, under the principle of global interactive nature of economics, it is easy to understand that economic warfare is self-destructive. It is a kind of pyrrhic economics. The impact of “economic warfare” in economic systems can upstage the issue of economic security based on standard models. Economic warfare is a multi-cube threat to economic security. Economic

¹⁰Romm. Ibid. p. 56.

¹¹ Butterfly effect is a term used by the weather people. It is said that disturbances in the atmosphere caused by the flutter of a butterfly in a garden may contribute to the weather pattern in a far distant place cross borders.

warfare is the use by the government and economic, as distinguished from the military, measures in international conflict. Such measures include export-import controls, trade agreement with neutral nations, shipping controls, blacklisting, blocking of opponent's exports, aids and assistances and pre-emption or preclusive buying. Economic warfare may also be defined broadly to include all measures undertaken to increase the economic power of a country at the expense of other countries. Economic warfare is creating a win-lose situation in an economic game. The concept originated during World War II continued as part of the containment system during the Cold War. It may also include measures by one nation to ensure the economic dependence of another and thereby obtain political power over it. Aids and sanctions are part of it. However, under the principles of national security envisaged in his book, a win-lose game is short lived. Economic warfare is such a game. It causes serious long-term damage, more to the winner than the loser according to counterfactual thinking.

Economic warfare is the name for the game a nation plays with its gang of supporters for a consideration in which the enemy is the targeted country or imaginary system. The prime objective is "all for me". The players may also use criminal methods, the so-called dirty tricks departments or the "rooms" that act as the bases for such games. Everything associated with "economically bleeding the enemy, strengthening self or both whether by acceptable or permissible methods such as sanctions or UN controlled resolutions or criminal and irresponsible methods are freely thrown in". The criminal methods involve counterfeiting, crimes³, terrorism, subversion, coercive control of opponents, politicians and deceptive methods that responsible nations should not practice. Lavish amount of financial corruption is thrown in with its associated glamour in economic warfare. The UN alone as the supervising global vigilante cannot function to the extent required. After all it is also run by people with a Charter that needs a second look to adjust with times.

Within these parameters, the basic economic security depends entirely on research into the problems of instability and identifying the stabilisers required to be infused at appropriate times. In an economy, millions of people are engaged in a number of distinctive activities—production, distribution and consumption of all the different goods and services. The organisations will not survive when a breakdown occurs in the coordinated activity of such overwhelming economic propensity, though such breakdowns are very rare. The only serious example was the Great Depression. The way in which the economic puzzle is solved without anyone thinking about it has been the broad main theme of economic theory since the time of Adam Smith (1723–90).¹² The question that is often put forward by analysts is that whether economic concerns surpassed military ones as the preeminent national security problem, and, if so, is it wise to adopt a strategic technology or industrial policy.

What are the basic requirements for economic security? According to Ashwini Deshpande from Delhi School of Economics, they are growth in the real sectors of

¹²Scottish economist and philosopher.

economy: industrial and agriculture and expansion of rural markets.¹³ It is India specific and also applicable to similar economies elsewhere. Economic security meant purchasing power for some. In peasant economy, it also means rural purchasing power. It is interesting to note a find by Professor Ashutosh Varshney of Notre Dame University that in (electoral) democratic countries poverty line is higher and showed slower decline, whereas Amartya Sen's findings show that (electoral) democracy had, without exception, abolished famine.¹⁴ He mentions that it is because such types of governmental systems adopt direct methods: subsidies, job reservations, transfer of assets to the poor, etc. (through land reforms and cheap loan schemes), whereas the indirect route is often an unnoticed passage to permanent economic security: accelerating growth of gross domestic product (GDP), increasing productivity, market friendly policies and investment in health, education and infrastructure. This confirms that economic security can be jeopardised by military over-investment and direct poverty alleviating methods.

10.3 Transboundary Nature of Economics

In the context of national security, economics is transboundary. It is mentioned earlier. If treated insular, there are chances for disorder to set in. Money is the only "religion and language" common to the world though treated differently by each individual psychonomically. It cannot be managed by "my economics is different from yours" maxim as in religious belief systems where the posture of intimidation is "my God can incinerate yours". The latter statement is true with money as the one with money can take on another without money. It is not sure whether religions and other faiths are based on economics, but most of them, if not all, have their own economic principles and systems. That makes money the mother of all bags of faith and belief systems.

A closed-door economy or a system that shuts its doors to global economics¹⁵ is similar to a room closed to ventilation. It is a closed system where economic disorder will brew up faster. There can be life in it, but the sense of security that forms within

¹³ Deshpande, A. "Economy in Logjam--Fallacies of Liberalisation Dogma." *The Times of India*, Mumbai. 28 July 2001, p. 10.

¹⁴ Aiyar, S.S.A. "Why Do Democracies Remain Poor?" *The Times of India*, Mumbai, 2 September 2001, p. 12.

¹⁵ It is important to note that the global economy functions in a closed system—the world itself. Any nation, therefore, forms a sub-system. Since global economy has to face problems associated with a closed system, a closed national economy, as a sub-system, will undergo faster decay associated with the closed system entropy. This itself is sufficient to prove that global opening out is very essential for a national economy to survive (longer). Under the current situation and more in future, it will also be difficult for any nation to close its economy anyway. This is by evolutionary default and is a positive sign that the problems of economic insecurity that the world may face in the future will be less serious than that it faced in the past. The changes are permanent though the law of invariance will pervade at the core of the human system.

vanishes, and thereafter, the state will have to support the people to secure it. Often the states cannot do it since it will be an additional burden of governance. Welfare measures of dolling provide temporary relief. They are harmful in long term. The exhaustion comes from chasing the tail that could never get into the mouth for a bite. Economic manoeuvrability, an essential ingredient of economic security, will be restricted under such perception. Those who argue the validity of going global understand that the essential ingredient of economic security is good economics. It is a prerequisite. However, what is good economics? It is a million dollar question. Somewhat close is the answer that good economics is transboundary open economics in modern times. Transboundary economics is not about money leeching across national borders but the ability of national economy to cross the economic system boundaries to spread globally. The reach of national economy should be guaranteed for global returns and influence. There is a biomodel among human systems that shows community living are all in clusters where economy leeches. In other words, in every community system one may find people of more or less equal economic status. This statement is a bit exaggerated. There can be exceptions too. Those who are at higher level economically will also stand at higher level of power to influence those below. Globalised world does not essentially mean a world under a common or unified global economy. It has to be a competitive economy, at the same time healthy. It should not be under perennial economic conflict or warfare in an adversarial sense. It is also not looking beyond the borders to become a global player and accepting risks at the cost of national economy. It is the ability to understand that global economic changes can affect a nation's economy and the will to accept the challenge. It has been the way in human systems. Good economics is to spread out the economic aspects as far as the human systems have spread out—the entire world. This means crossing the national borders and regional limitations. Good economics is a global issue. Economic warfare is bad economics. The gains of economic warfare are not only short lived but also face dangerous consequences in the long term. Many nations in the world, who played the game adversarially, are about to experience the effects of such short-term gains. It will be a subject to watch and study for economists who may appreciate this hypothesis.

Identifying the concept of good economics is important to understand economic security. It cannot be easily interpreted. It can be analysed from what it is not—the reverse process in logical analysis is when direct analysis is not comfortable for a solution. The most widely preferred method of capitalism or the least preferred method of communism has a go in socialism or other middle road pathways with turnpikes for those to whom this statement applies. The hardcore capitalist or the hardcore communist does not subscribe to the midway economist.¹⁶ The pathways twist, turn and wind through different planes of economic articulation under various theories from Robin Hood's Sherwood Forest economics of “rob the rich to feed the

¹⁶This is under the assumption that capitalism is the opposite of communism, which exactly is not. They are two different concepts and are only comparable with respect to the binary axes of human system governance not strictly economics.

poor” to what the big benchers preach in modern skyscrapers in a dazzling city or the corridors of governments may opt in populist economics. All economic institutions, one should understand, are threat attractors. There is a warning here. Anything that deals with money has a natural threat attractiveness associated with it. That further qualifies the dictum of transboundary economics in the campaign for economic security.

Transboundary nature of economics is equally applicable within a country. It does not have to relate to cross border between nations alone. It has to be a constitutional element associated with governance. The rights of people have certain part of economic security imbibed in it. Taxation by the government that takes away even from the relatively poor may meet with the antihero dictum of Robin Hood. Still the tendency of the governments is populism in economic management. Populism in economics brings short-term dividends in a nation’s governance. It is supported by self-interest—an essential ingredient for human survival. When it goes astray, often it does, populism wanes, but it may have already reaped the benefit for the protagonists. Maximisation of profits, collection of votes, support for ideologies, etc. are the variables within self-interest. Followers of popular economics may eschew it if they know it can boomerang before time. Often they are not aware. Moreover, often it does not boomerang. It is similar to cult behaviour where a community becomes hostage to a cult figure without being aware of it. There are too many Robins with or without hoods today in the Sherwood Forests of economics where money is swindled or mismanaged. They survive on political and populist support.¹⁷ The loss in this case is to the community even when populism boomerangs. It is more felt in politics and unethical investment practices. Populist economics is followed by those who demand power to rule. However, the beneficiaries can differentiate between populist economics and good economics. Free power is ephemeral. When it is obtained by economics, there is no place for good economics. Good economics provides substantive benefits. There will be drinking water, rural roads, public transports, good health care, education system, farming, infrastructure and employment opportunities that are not necessarily governmental. In general, good economics is expected to bring sustained rise in earnings of the people. Short-term measures of income generation are populist palliatives, not good economics.

All these show the transboundary nature of economics even within a country. Moreover, from there the road across the borders of the country into global economy is not too long for the determined and should not be an aversion for the advocates of anti-globalisation theories. One of the secrets of good economy among many others is learning to play well within a global economy.

¹⁷ An interesting example is that of Koose Muniswamy Veerappan Gounder (1952-2004), branded as the enigmatic, rich and powerful forest brigand of south India who eluded arrest throughout his 36 years active period smuggling sandalwood, poaching elephants and kidnapping for ransom of politicians and celebrities before shot down by a police taskforce in 2004. It was alleged that he was close to some political parties and politicians in the region who depended on him for funds.

10.4 Globalisation and Economic Security

The theory of globalisation is supported by the transboundary nature of economics in national security. An often mentioned aspect for enriched economy of nations is poverty alleviation. It is linked with globalisation. Downing the trade barriers by the rich is a way to do it. It is accepted in the clarion call of Don McKinnon, the Commonwealth Secretary General, to the rich countries to open their market to poor countries for their products by bringing down trade barriers to alleviate global poverty.¹⁸ Globalisation is not a new concept or an accidental cult of modern-day economy. It became reality when people started invading or migrating across borders. It is as old as human race itself. The fuss, if any, about it today is with the psychonomical aspects of money. Globalisation will be real as long as people move cave hoping across their borders. Globalisation is integral to a nation's economy however insular it may try to be. The caravans on the silk routes and mountain tracks, and the armadas across the seas, brought and exchanged money in one form or another. That was globalisation—the open system from the early days. It will be prudent for a nation to play it good, not to shut it out.

The difference of globalisation then and now is in the speed at which today's world works. Theoretically, this speed should be increasing in the future. Hence, it is all the more important that nations embrace a chosen policy, appropriate to its philosophy, of being a party to globalisation lest it should not tumble over in the speed of the future once decided to go for it. The integration of global economy has raised too many fears as the rich is prowling on the poor. Yes, they will, if they do not understand the dictum of economic security. Preying on the poor will be self-destructive for the rich. The rich will become richer only if the poor becomes rich is the basis of economic transactions. This is the way the “waiting line” (in the queuing theory) moves forward. The poor has a choice here—make the rich richer. In fact it is not a choice at all. It is more a practical approach in moving ahead in the economic lineup. This is what is happening in the economic world in employer and employee and trade and market relations at all levels. There is no system in which the rich can become richer by making the poor poorer unless the rich directly robs the poor. That is not economic security. The rich will decline in the long run pushing the poor further down. In any transaction according to good economics, there is only gain for both the rich and the poor, in which a notch ahead is the objective achievement. This is also an argument in the win-win philosophy in national security.

There are debates whether globalisation is good or bad for a nation's economy. The answer lies in the issue itself. Globalisation is not anybody's making. It is a natural happening in an interactive human system. The actual artificiality is in the divisions of national systems. The world ideally is designed for a singular unit under the singularity principle of humans. It is the differentiability that forces for national systems being group specific. The group specificity originates from human

¹⁸“Bring down Trade Barriers—Commonwealth to Rich Countries, Commonwealth Secretary General Don McKinnon said.” PTI News Scan, 27 December 2002.

principles as social beings. As mentioned before, globalisation has to be seen a long-standing reality, and the choice is to use it to the best advantage of a nation's economic security. It lies in governance. The national economic policies, appropriate to each nation's economic security, have to be designed accordingly.

Most of the debates are focused on the competitiveness of a nation to survive in a global economy that is expected to be brutally aggressive. It is an issue if the nation does not possess the required competitive strategic determination. It becomes worse when the nation practices measures to cut competition—reducing wages, cutting taxation, subsidies, welfare measures, etc. It takes away the long-term efficacy of the economic system and blunts the cutting edge further. It is the opposite that will make the cutting edge razor sharp. Of course, this is a generalised statement.

The surge in globalisation today is because of improvement in communication and infrastructure and the wisdom associated with the subject itself. The world awareness is better today. Suppression and subjugation to slavery and colonialism are not favoured choices. Globalisation process of the world however was not continuous; there were interruptions. Every time when it came back, there was a change. If that is so, then today's globalisation may also function towards an interruption. "When the interruption is expected?" is a question that cannot be answered. Even the style of interruption could be different. Technology, including communication, will always remain the driving force of globalisation and associated wealth generation, accumulation, retention and regeneration.

Economic security is not about affluence but assured economic well-being. It is the assurance that matters. To that extent, globalisation is a supporting element of needs by the integration of world economy. It is not easy. For example, there are financial markets that are not completely integrated in a global scenario. Lowering the barrier for foreign trade is another factor. There is also the requirement of product-market integration as well as reducing the time to market. Difference in taxes and inefficient distribution systems can affect global product-market integration. It shows that globalisation process, irrespective of its reality, will function under local parameters. This could be good news to those who oppose it. Globalisation is checked by default in its expansion towards market destruction elsewhere by natural laws. These laws are deep-rooted in the psychology of economic mind—the psychonomics factor. It is this psychological factor in economics that makes it potent in national security as an element.

In its actual sense, globalisation is integration of product markets, financial markets, capital markets, labour markets and commodity and resource markets. In that sense even in today's fast moving world, globalisation is only a marginal reality. Globalisation at any time remains partial based on need and opportunity. It is more spoken than practiced. The markets that are not integrated or the parts of the market that are yet to be integrated will remain national. This is another point that the opponents of globalisation can note. Globalisation is expensive. Unless there are means to keep the costs under check—cost of communication, for example—globalisation will face a setback. Liberalisation, in an economy that cannot afford or is not yet ready to play the globalisation game, can be counterproductive. Under

such situations, the process of globalisation should wait to accrue maximum benefits out of it.

There are two questions nations may ask. One is, “How much free trade exists across the border?” The second one is, “How much trade a nation can do with another across the border?” The answers to these questions will vary from nation to nation. One is dependent on the other. The ideal situation is when a nation can do as much free trade as possible with another in a competitive environment. However, there are other theories too. Global trade includes goods and services that move across borders. According to an economic thought, the real benefit of trade lies in what one imports and not what one exports.¹⁹ Because, for economists the real purpose of export is to develop the capacity to import.²⁰ According to this theory, the commodity received is the benefit, not the commodity given. This is the actual effect of globalisation. Ideally every nation stands to benefit by what it has imported, and this maxim supports the health of global economic security under the transboundary principle of economics. Politicians and self-informed nationalists will support domestically made products for political reasons.²¹ Both have reasons. For the politician, it is a professional requirement, whereas for the latter it is a belief system—a psychonomic interlude. This is a matter of serious debate. The argument in favour of domestic product is that the product will be cheaper and will yield employment. The counterargument is that the product’s quality will suffer if not under competition, and import opens up employment in distribution, retailing, etc. A cheaper and higher-quality product is better with a high-value analysis whether imported or domestic. Arguments could go on endlessly. According to trade theorist, the benefit of exchange of one product for the other remains in the one that is received not the one that is exchanged.²² The fact is that a nation will be better off by trading what they are good at in making within the comparative advantage. In such case, it is a win-win situation for both. Comparative advantage is assessed on products on which one has an edge within its absolute advantage compared to another country with which it prefers to trade.

There are oppositions in outsourcing or trading on comparative advantage, which is based on one of the most sensitive issues of economics: jobs. Palming job issues can turn around an election for a political party. Loss of a particular job is true in case of outsourcing. This threat is more viewed by comparatively rich countries against poor countries. Most of the economists argue that it is an overstated apprehension. There will always be work for higher-wage countries. It is a question of identifying them. This is especially so with the economic benefits of trading advocated against comparative advantage under a regulated and disciplined world trade system. This

¹⁹The Economist. (2001). *Economics: making sense of the modern economy*. Profile Books Limited. p. 24.

²⁰Ibid., p. 25.

²¹Ibid., p. 9.

²²Ibid., p. 25.

has to be worked out, based on geostrategic security concerns, with world trade and other international organisations.

The key factor in playing the game of globalisation is assessment of comparative advantage. Whereas absolute advantage is the gain one has over the other, comparative advantage is based on relative advantages. Theoretically, costs and quality are associated with relative advantages. Purchasing power and margin of profits in the deals make other factors that may break into cost and quality. Most of the trade takes place without much to do with comparative advantage. A lot depends on relationships and vicarious advantages. Trade negotiations between countries are based on the element of geostrategic security applied to international relations. Even quality will be sacrificed at times based on opportunity matters.

10.5 Money Trail in Economic Security

The economy of a nation has its speed limit that changes with respect to the influences on it. It is the limit at which it can grow in relation to the supporting factors. The limit at which inflation takes off is one of the factors that limit the speed of economy. It is not the only factor. Inflation is too much money chasing too few necessities that are available. The necessities then become pricey and not available to many. Inflation limits the security feeling in such cases. Inflation is negative economic security beyond the speed limit of economic growth. Sound monetary policies can counter this negative feeling and create hope that can be pursued by people. The way inflation can be brought down is only by sound management of money trail. Reducing duties to check inflation is one method, but that will make prices fall but increase demand thereby raising the price again. The idea is to lock down the demand. Decision makers are important at this point. The problem is that they will differ on the actions to be taken; to think of it, it is also the advantage if the government is clear on how to process the decisions and advisories that come from experts. This is where governance takes priority over everything else including expertise around. Leadership matters over decisions because every decision counts. Leadership resolves which decision to take up with utmost vision for the future. Leadership is the arbiter in such situations.

Psychonomics plays a part. For example, workers may fear job security and hold on to wages that may control inflation. Low inflation again is not a sound indicator of economic security. Inflation may be low because of economic insecurity. Illusive money or funny money can make people feel richer though in reality they may not be. The money trail deals with real money. Fighting inflation is a game of hide-and-seek. It never comes into hold. Inflation is seen with relative viewpoint by those who play with money. Hence, the money trail varies for individuals, government and financial organisations market watchers and other stakeholders. It may be low for some and high for others. It all depends upon the purpose for which it is observed. The accuracy of inflation is also a point in question. The trail, therefore, becomes

difficult to appreciate in a crisis situation or when the situation is going to lead to a crisis. Panic always sets in beforetime in money matters. These early situations nudge the chance that otherwise would have been available for corrective action in money trail recovery. In economic security, inflation never dies, but does that matter? If not, what matters?

Inflation control involves both monetary and fiscal measures for short term. The time thus available by applying such measures can be utilised to contain inflation. Money supply can be tightened by increasing the cash-reserve ratio, adjustments in the repository rate or asking banks to absorb excess liquidity in the system. Tightening credit to prevent it going out of control is a policy. Food price stabilisation is another policy. Inflation needs expert and professionally measured response. The time of the year when inflation is expected to rise needs to be checked prior palm. However, sometimes, it may be counterproductive. An example is increasing interest rates. These are the traditional methods that governments adopt to contain inflation. An increase in interest rate is normally thought of. However, the downside of it is jitters in the market. Fiscal side is more endearing in such situation: cut in customs duties on identified products of import—petroleum products for example—and select consumer goods to ensure them cheaper. Sharp rise in petroleum products and imbalance in agricultural products can trigger inflation.

Understanding the reason for inflation is important for managing the consequences. Inflation is a symptom, not a disease. The result is a decline in economic security. Reasons can be far too many. Inflation can be imported or domestic. The cause cannot be attributed to favourable entities like oil prices though it may have a cascading effect on inflation. Government spending, edible oil prices, commodities, price shock, money flow to people on credit, credit worthiness and credit ratio of people, customs duty withdrawal, etc. are fine to target if they are contributing to price rise for manufactured goods. Ad valorem duty—proportionate increase in duty and then price, where price chases duty—is also debatable. There are over the board solutions like tariff reduction. If demand leads to more goods, easy credit policy is an option. When consumption goes up, government can advise people not to chase expensive products. It is people participation and involves psychonomic patterns of inflation control, probably never exercised so far. Partially, the mysteries of economics are hidden in psychonomics at the point of origin. Thereafter, it takes different turns.

Domestic as well as external factors govern inflation. Inflation is often seen against interest. Interests accrued can be weighed against inflation. Inflation reduces returns on investment. Loan interest gets increased. The stock market can cut into margins of companies being entirely insular. There is no set period for inflation. It may constantly increase, reduce or vacillate depending on the measures taken and their effect on the economy. Outsmarting inflation will be a classic lesson in economic security. Recasting national priorities may be advisable, but the same recast can increase inflation. There are no magic ways to beat it (Is there an option where the inflation is left alone and watch the way it moves over a period as the way to tackle it? If available, such option may pre-empt some of the side effects of inflation control in economic security). The key for inflation control may lie in the

investment market, where the pattern for investment can be changed and seen through risk profile and analysis. It is the realm of financial engineers from the actuarial viewpoint.

The author fondly remembers his professor of economics who once compared inflation to blood pressure, bad at both ends—high and low. High blood pressure as well as low blood pressure is a cause of concern to individual health and so is inflation in economic system. He is right in one way, but could be off the beam to consider inflation similar to fluid dynamics especially “hydraulics” in the economic system. But, why not? Like blood, money too flows under pressure of demand and supply, that is, economics. Money can be visualised as the blood line of quality economy. If that is so, can economics get a makeover to appreciate the money trail through the pneumatic circuit based on the velocity of flow of money in the national economic system? If so, velocity of flow of money will indicate the trail of money as well as the directions. The malignancy in the system can be identified and contained by adjusting a few taps and valves on the flow pipe and popping up a few descaling pills as a course of treatment. Velocity of flow of money is taken up in an ensuing section.

Intelligence agencies have a way of following the money trail in their investigations to know the intent of the adversary—“watch from where the money comes and to where it goes”, a sound technique, indeed. This, again, is what the author heard from a professional faculty in intelligence service in a class on economic warfare. It could be followed by those who wants to provide economic security to their people: take a walk along the money trail, up and down until one hits at the sense of its direction to decide to divert or otherwise. There is a lot hidden in the trail for analysing economic security.

10.6 Economic Advancement

Economic advancement, in this study, is the process of moving towards economic security in time. Economists use and research on many terms within this standard. In its simple usage, economic advancement refers to the policies of government to achieve higher level of economic standards for sustainable quality life. Primarily in econo-speak, it is about economic growth and economic development. There are many metrics to measure and index them. A lot of gibberish goes into it with experts vying with each other to find remedies for economic malignancies of nations and the world. Well, seldom they do biopsies on samples to find whether such problems are terminal. One of the reasons is that they know the malignancies are not terminal. The secret of economic security lies in this belief which is seemingly true so far. That also shows the world will only advance economically and in comforts of life through periodic roller coaster rides which, one may believe, are only meant to correct and balance the system. Does that mean the principles of economics based on which a government plans for economic growth and economic development need a second look on the primacy of economics in it at every stage based on objectives identified?

Or can the governments leave them to their not so common political sense? Or does that mean an economist who talks differently from the other is also true? Does it also mean this chapter has something to tell meaningfully at the end?

Economic growth is not economic development in the study of economics; they are different. Once a student asked the author, “If economic development is different from economic growth, how come growth is synonymous with development?” Well, did not know what to say. But the author’s answer was “Yes, in English, but not in economics”. On an afterthought, one may feel both the terms may not be correct to express what one is attempting to convey. The idea of economic growth is based on market and productivity enlargement. Obviously, the market economy matters. Economic growth is inflation-adjusted market value of the goods and services produced in a country (economy) over time usually a year. The percentage increase in real GDP (gross domestic product adjusted to inflation) is one of the metrics to assess economic development. GDP need not be the only measure of economic growth (Box 10.2). Or it could even be a faulty metric to assess economic growth. It is good for local politicians to argue their cases in an election to the voters who are used to selective gulping of information. Economic growth is when productivity is improved in goods and services. A country needs both. But then can they be different in isolation? If not what is the link between quality growth and quality life? For a quick appreciation, it can be said that economic growth indicates the increase in the output of the country in a particular period, hence a function of time for comparative assessment, as a feedback in economic appreciation. Economic growth means the country is a knowledge economy with advancement of education and research and associated technological advancement and value addition.

Box 10.2 Is GDP Everything?

There are arguments that the GDP is not the god of economic development. It is an indicator of convenience. It is the total value of everything produced within a country plus a bit more. This a bit more expression is one of the fault lines as it is not easy to assess unlike the product value. Hence, what the people say and argue as GDP is partial GDP—the tail of the cat, not the cat. However, economists and citizens who are not economists unanimously argue that the size of an economy of a nation is based on its GDP. It has everything to take the final call on the economy, they feel. One is being careful about double accounting. GDP is gross domestic product arrived at as real, nominal or net. Then there is net national product also. The calculations are sectoral, especially the first three: primary (agriculture), secondary (manufacturing) and tertiary (infrastructure, production and exchange). The quaternary (knowledge) and the quinary (gold collar people and their skills) are not included.²³

(continued)

²³They are the five sectors of economy. The argument is that assessing the economy should include all the five sectors. Otherwise it is vague and approximate. It doesn’t indicate quality of life or well-

Box 10.2 (continued)

There are no measures on the quaternary (knowledge part of economy) and quinary (decision part of economy). Some countries differ from it. The present metrics say rise in GDP indicates good economy and fall signifies bad days. Is that all about economy? Something is amiss here and that shows why some do not buy it. GDP does not indicate everything and therefore cannot be an indicator of human well-being. This study does not consider it useful for arriving at the national security index. It is only acceptable in the absence of a better indicator. That calls for further research. Simply put GDP as concluded in the present-day economic studies is the total output of a country in economic terms (how much it produces within its borders) in a period of time which is normally taken as a year. The amount is found out simply by adding its outputs with or without an abacus. This measure is often used to deliberate on the economic health of a country. The more the GDP, the larger the economy for GDP-addicted societies.

Economic development is about the improvement in the standard of living of people with respect to a particular nation by increase in income—from poor to rich. The quality of life is the indicator for economic development. However, there are many other things associated with economic development for experts to see. However, primarily in a developed economy, the people will lead a better quality of life where quality life means monetary affluence. This term is in vogue since the last century. Economic development is the result of determined and planned action by governments based on identified objectives, hence part of governance. Economic development indicates the quality of life in the social system of the economy by enrichment of living standards which also indicates advancement of technology. Economic development is inclusive of economic growth and its contribution towards improvement in being living standards on a longer span of time in the life of a nation. Both economic growth and development are measurements of economic well-being by economic advancement.

Economic growth is a short and limited term, whereas economic development is a long-term process. Both together make it a perpetual movement of economy in economic advancement which forms the basis of economic security. In this context, economic advancement comprises both the terms—economic growth and economic development—and other that are in vogue indicating movements in economic standards and economic environment of a country at a particular time.

Ideally, the economy of a nation surges in leaps and bounds in a system even if it is generally planned well. Planning helps to find a course and allocate a pace provided that is the purpose. As stated often, the plan is based on the need identified

being. Therefore the GDP as it is today cannot be used for assessing national security index to measure the state of well-being of a country. The last two are also considered in certain studies as subdivisions of the tertiary sector.

by the government that could also be political. Social changes have a lot to do for economic movements in spite of supportive policies. The world, as it advances moment by moment as an information or knowledge-based society, can pick up speed in the development and growth of its economy. The economies that decide to ride on the upward trend of social changes can reap rich benefits provided they have the necessary knowledge expertise.

The economies are becoming hard to tax and regulate.²⁴ The tax personnel may not find many transactions to assess in a busy and growing economy. This prompts them to device new regulations least knowing that regulating an economy that is not measurable is also difficult. Under such circumstances, the government has to find effective apparatus to measure the economy and its development as well as growth rate effectively to tax those who receive them. Following the money trail then becomes easy and subsequently leads to devising better ways of taxation.

An advancing economy needs to adjust with changes, slow or rapid. The change need not be monetary alone. There will be change in government and those induced by war efforts, disease, draught, information systems, knowledge or any other push-pull factors. Changing frequencies of the push-pull factors cause rapid changes in economy. If the pull factor is more, the average citizens enjoy better standards of living. Their purchasing power and access to money increase. As long as the feeling is not illusory, it supports economic security.

A friend had once remarked that the best place to keep the money in his country was his own pockets (specifically at that time). He had no faith left in the banking system, let alone the investment market. When financial markets fall and interest rates rise, government's debt-service costs shoot up. There will be a sharp devaluation of national currency along with a Good Samaritan support from overseas. It could be World Bank (WB) or International Monetary Fund (IMF), if not the superpower²⁵ nation (whoever it may be) itself. The government temporarily becomes powerless compared to even the traders. It is worse in small countries that have a budget less than that of the next-door smuggler, drug trafficker or the cruise line company of the ship anchored in the bay. A government can get into such financial jeopardy in spite of following all the rules that will make even a student economist burn the textbook along with the professor's notes. A lot of such things have happened in the world close to the new century: European exchange-rate mechanism burn out (1992–1993), the Mexican peso crisis (1994–1995), Asian crisis (1997), Russian debacle (1998) and the Brazilian knock off (1998–1999) are examples. Most of them were attributed to government mismanagement. It is the government, the guardian of national security, who is accountable for economic security to its people.

²⁴The Economist. (2001). *Economics: Making sense of the modern economy*. Profile Books Limited. p. 87.

²⁵The term superpower nation is preferred to superpower.

Do the governments have limitations? Some say, the governments are powerless to defend their countries' economic interests in a global market.²⁶ Massive international capital flow through electronic bond and currency trading has taken the power off from the government in regulating a nation's economy.²⁷ The blame for a debacle is put on the financial markets.²⁸ Currency speculators in international financial market can cause a big dent in an unsuspecting nation's economic security. The government can feel totally helpless under such conditions expecting a bailout from someone who may just walk in. That is hope, of course. It is inadequate policies to blame in a collapsing currency market. It can be easily taken advantage of by currency speculators. Economy will be the victim. According to Jacques Chirac (1932–2019)²⁹, former president of France, financial speculators are the “AIDS of the world economy”.³⁰ The bottom line is that governments may not have control over economic growth and development of their nations unless they find a way absolutely different from what they practice today. This is important because economic security cannot be outsourced even within by the government. It is an exclusive task for a government in national security.

Besides economic textbooks, the governments and their economic experts, including the minister or secretary of finance, are armed with various tools for financial and economic progression. They are in the form of theories, anecdotes, regulatory measures, taxes, public spending, interest rates, credit controls, exchange rates, capital controls, income policies, etc. There is a lot more. However, these tools can only follow the textbook administration and not exercise control of the onslaught of the neo-economists who plunder the financial markets by legal speculation. These markets have tremendous power under the new knowledge in an information regime that may be beyond the reach of a government. The powers of the government over their economies were traditionally based on the ability to tax, print currency and borrow finances. In a liberalised and globalised market, the government loses absolute control over these since the markets have many choices. Under such situation, the government may resort to economic deception of its citizens. The scenario is ripe for many clashes between financial markets and economically ineffective governments who promise heaven to their voters. As experts make the people believe, for the common citizen, things will look up in liberalisation and globalisation. For once, the element of economic security seems to be not with the government, but outside it. It may be wise for the governments to work with the markets, not against them if they want to hold the key.

²⁶The Economist. (2001). *Economics: making sense of the modern economy*. Profile Books Limited. p. 87.

²⁷Ibid.

²⁸Ibid.

²⁹President of France (1995–2007) who also served as prime minister from 1974 to 1976 and 1986 to 1988.

³⁰Allen, L. (2005). *The global economic systems since 1945*. Reaktion books. p. 181.

Fly by night market operators indulge in creating sudden wealth and then channelising it for other income-generating activities. Such activities may affect economic advancement if the methods adopted are fraudulent. Even if the latter is basically within the law, the original investment income may come from fraudulent activities. The parallel economy finances thus get into the mainstream money line like sewage in the drinking water supply in the city. The result is yellow money (see section on psychonomics about colours of money). Yellow money is when black meets white and reproduce. The offspring is yellow like jaundice. This causes serious economic turbulence in the fiscal calculations of the government.

Public offers and financial companies could be easily brought under law to cut the fraud. Even in legalised and strong companies, there could be income that is withdrawn behind the audited reports. Industrial companies, financial institutions including banks, etc. can fall within the fly-by-night operation systems. Fraud is a killer of economic security, and it is everywhere in its original and disguised form. The disguised form is a kind of secondary fraud that often goes past the enforcement system. The governments are either unaware of it or are unable to act against it. Agencies may support them in abusive system. These are the leakage in the economic system that impacts economic security like a bleeding vein.

Credit rating of a country is often seen as an indicator of the level of economic security in certain quarters. When it is done under specific objectives, for example, to attract or distract investments, such credit rating loses its value from the point of view of economic security. Credit rating depends on domestic debt. Debt, strictly, is an ongoing issue in economics and is a means for investment for wealth creation. Debt, for an economically vibrant nation, should not be viewed as a drawback. There could be debt even in heightened economic security situation. There is hardly any situation where profitability is not rooted in debt. It is applicable even in individual finance. For a nation, the credit rating loosely speaks about foreign currency outlook. However, economic reforms boost credit rating, but they are not signs of economic security unless ripened into profits and thereby contributing to the purchasing power of the people.

Economic advancement will depend upon trained personnel ratio for different age groups, the quantum of world trade, foreign direct investment (FDI), tourist arrivals, etc. The strategy is to see that people are equipped with the skills needed for high productivity and quality. The key areas for model economic growth are infrastructure development, labour productivity, investments, capacity and utility of plants and productivity of capital. The higher they are, the better for successful wealth generation. An empirical study by the World Bank shows that the income rise for the poorest of the poor and the rest is at the same rate.³¹ That is the advantage of growth

³¹ Moily, M.V. "Reforms: Riding the Indian Tiger." *The Economic Times*, New Delhi. 2 June 2004, p. 18. The author highlights the findings of the study of the World Bank's Development Research Group. An empirical study carried out in 80 countries over 40 years, entitled "Growth is Good for the Poor," shows that the income of the poor rises one-for-one with overall growth. That means the income of the poorest of the population rises at the same rate as everyone else's in a growing economy.

since there will be overall balanced development. The upward nudge in income parity of the rich and the poor is the underlying principle of viable economic security. The gap may still widen, but it is the momentum forward that matters.

10.7 Government and Good Economics

Everyone knows what is meant by a good government (not governance), well almost. But what is good economics? A lot of discussions have gone into understanding good economics with or without mentioning the term. The book *Good Economics for Bad Times: Better Answers to Our Biggest Problems* (2019) by the American author couple Abhijit V. Banerjee and Esther Duflo makes scholarly read. The book draws from research in economics to place solutions to the issues facing modern economies and societies around the world, including decline in economic growth, immigration, income inequality, climate change, globalisation and technological unemployment. According to the authors, immigrants lower wages and take jobs from native workers. They also argue that people in poverty often make more sound financial decisions than is normally attributed to them. The authors jointly shared the Nobel Memorial Prize in Economic Sciences³² with Michael Kremer in the same year of the book's publication. There are ample suggestions and recommendations for poverty alleviation in the book. The authors do not define the term good economics but had written earlier another book titled *Poor Economics: A Radical Rethinking of the Way to Fight Global Poverty* (2011) that alludes good economics is neither poor economics nor bad economics. The book articulates the efforts to alleviate the economic evils especially poverty. This study suggests that to understand good economics and governance, one may have to take a longer route through economic security beyond zero poverty. It also means aligning other concerned elements of national security such as food security.

Holding on to the thread that good economics is anything but poor or bad economics, one can come to the common denomination of poverty. The author duo has shown great concern for poverty alleviation which is also the first priority of UN Agenda 2030. So at least when concerned with the governments, good economics turns out to be economics with zero tolerance to poverty. However, the problem with poverty is that it is not about not having money but the human stasis in the absence of basic provisions to satisfy the physiological needs—food, clothes and shelter. Poverty is not being poor. Poverty can affect anybody who does not have access to basic physiological needs though there are vulnerable groups such as children, elderly, differentially abled, sick, lonely and so on. Good economics

³²The prize was established in 1968 by a donation from Sweden's central bank to the Nobel Foundation to commemorate the bank's 300th anniversary. It is not one of the prizes established by Alfred Nobel in his will in 1895, hence not a Nobel Prize. However, it is administered by the Nobel Foundation. Laureates are announced with the Nobel Prize laureates, and receive the award at the same ceremony. It is the most prestigious prize in the field of economics.

Table 10.1 Hypothetical economic SWOT analysis of an assumed developing country (Paleri, P. (2008). *National security: imperatives and challenges*. Tata McGraw-Hill Publishing Company Ltd. p. 164.)

Strengths	Low inflation, soft rates of interest, large foreign exchange reserves, low external debt, strong service base, healthy export growth, human capital, technology, knowledge base, stable government, high GDS, high GDP, high credit rating. . .
Weaknesses	Weak investment demand, high fiscal and revenue deficits, slow reforms in labour, slow banking, poor social and physical infrastructure, small-scale reservations, unplanned increase in population, terrorism and insurgency pockets, disaster prone, heavy military and government spending, resource crunch. . .
Opportunities	Potential in the service sector, attractive equity valuations, globalisation trend, diversification of agriculture, derivatives market growth, international credits, opportunities for global service provision including human capital. . .
Threats	High global oil prices, uncertain global economy, backwash of drought, poor governance, protectionist state government policies, illegal immigration due to insurgency in the neighbourhood, cross border terrorism. . .

extends to overall economic security. It is not poverty eradication alone. So to define good economics, one could take leverage on economic security. For the government, good economics means the process of governance leading to national security maximisation by optimising economic security along with other elements.

Fiscal and monetary instruments of policy govern good economics. They could be many—labour reforms, disinvestment, subsidies, liberalisation, government spending, interest rates, surplus funds, deficit management, etc. Most of them are legislated. Some ideas may be exclusive executive decisions such as capitalisation of brainpower. Research and development, technology and quality of human investment matter considerably in good economics as seen from many countries where, in spite of huge reserves of high value resources, development is retarded. There are countries where substantial percentage of population is isolated in spite of huge reserves of gold, diamonds and uranium.³³ They are rich and conflict-ridden countries with people reeling under poverty. There are also governments, but they may not practise good economics.

Savings of a citizen is an important outlay in an economy. The characterisation of savings into investments is even more important. The rate of gross domestic savings (GDS) (as percentage of GDP at market price at a time) can give a hint at the economic stability of a nation's savings to provide fuel to the national saving investment schemes. Economic security is related to growth that can be affected by many factors: plunging stocks, terrorism, scandals, etc.

A government needs to know the economic state of a nation at any given time. Though there are many methods to arrive at it, it is imperative the government goes through a SWOT analysis (strengths, weaknesses, opportunities and threat) of its economy from the appreciated data. A hypothetical SWOT analysis may follow the pattern in Table 10.1.

³³“Tharoor’s Top Ten.” *Hindustan Times*, New Delhi. 12 May 2004. p. 19.

In this study (a text case for SWOT), the growth rate as seen in the last fiscal year was taken as 5–5.5%. It is considered just sufficient to make an upward trend in growth, if careful. The macro-economic environment is considered stable. Global uncertainty will prevail, and therefore, the economy is to be managed under such uncertainty. Even global certainty cannot be a support for unplanned or wrongly planned economic development. The world economy at a given time can be bullish, bearish or recovering. Security concerns will remain paramount. The country will need 8–10% growth at least in the next few decades to make a dent on poverty and backwardness because of high population—a weak area. Resource hurdles and constraints in agriculture, industry and service sectors are to watch for. The government may simplify tax reforms. The concentration on collection of tax should not be on small-income assured return people like salaried employees, but high-income unknown trail individuals and groups. Basic tax structure should be on high-income non-assured group. Tax evasion should be seen at that level because the tax generated should be profitable to government policy. Government spending needs to be arrested, and military spending optimised to EDS (economic defence spending).

Savings is a high point in good economics. Saving trend of the people is based on psychonomics. It could also be that people who save comprise people who are apprehensive of future. It may be true, but such apprehension is natural, not abnormal. Citizens should be encouraged to save their money through attractive saving instruments exclusively for special and fixed-income groups. Tax saving instruments promote saving. Special income groups include interrupted and varying income group whose income may not be constant at a specific time. While interrupted income groups may have breaks between earnings, variable income groups' earnings fluctuate without break. Special income groups also fall under various categories according to their earnings as in the case of fixed-income groups with respect to wealth accumulation. Majority falls within special income category in a highly populated nation. There could be special saving instruments for fixed-income groups. Targeting such groups on tax plain is a difficult task though receivables in income tax are high and welcome in governance. Fixed-income groups are easy to target for tax, but receivables will be comparatively low. For these reasons, tax and savings are to be seen together for national wealth generation.

The growth rate target depends upon the economic goal which may be highly ambitious, relatively modest to minimum possible—to overtake all others and become the super economic power, to increase national power, to provide employment, to continue growth, to make a dent in poverty reforms, to lower poverty line, etc. The required growth rate will be different for each economic goal and each country. That has to be assessed.

Governments often involve in self-promotion. Though information transparency is a desired situation, such information systems tend to lean on populist efforts with a focus on politics. They often hoodwink the public with partisan attitude towards own people. Other people may wait till their team comes to power. It is a bad trend which responsible governments do not follow. Can populism cause bankruptcy? It is a question that governments, especially elected governments, have to ask themselves.

It is true that populism is most sought after commodity among governments³⁴, whereas in centralised governmental systems, populism is in the alms distributed among those loyal to it. A recipe for populism, therefore, can cause disaster. The fiscal deficit can swell in populist economic recipe. The government can lose face. At the same time, the government can lose power in the next election, if populism fades. Striking a balance is extreme necessity. Fiscal deficit is seen with respect to GDP as its percentage. The idea is to see that the investors including foreign institutional investors (FII) do not flee the scene because of non-attractive and risky offers. Regaining them will be hard work. The government is an investor in the absence of others in a public investment. That is opposite to privatisation. Public investment is a reverse process. A government needs money, and it has to come external to it, not by itself. This single argument calls for privatisation and downsizing public corporates. There will be an increase in unemployment, which in turn dents populism. That is a catch that has to be seen by opportunity within the SWOT analysis.

There is no place for delirium when talking about economics and finance. Government spending is on education, health care, agriculture lending, public facilities, etc. Such spending, besides contributing to inflation, also induces tax burden on people. There is no government expenditure that will not burden people financially though it may have positive effects of social enlistment. Such spending could be good and acceptable to some section in the populist frame, but will not be a measurable achievement. The return on government investment needs to be assessed scientifically, because failure of governance will show its first sign in economic security.

The most influential area normally adopted by governments in a populist approach is employment guarantee. It is a promise every democratic government will make at the time of election and will not be able to meet. Every government employment is a tax burden on the people. Instead of employment, it is productive employment avenues that could be seen. However, that proposal will not be populist except in a knowledge electorate. Providing avenues for employment is the best way where work also can be assured. Psychonomics is crucial here. Employment security, social security, etc. are conjectures and not even conditions in the national security theme. Employment guarantee will result in huge contingency liability to the government. It has to come naturally within the process of maximising economic security.

In spite of constant struggle between populism and economic realism, democratic system forms a better model of governance because of its variables for assessing and analysing economic security. People's mandate indirectly hints at economic aspirations of those voted. It aims in a common sense language towards sustainable economic development. The aspirations are on employment and a decent living

³⁴In the olden days it was told that some of the kings would go around in the garb of ordinary people and merge with the crowd to assess his popularity, listening to what people talk about him. Most of the escapades in disguise used to be nocturnal. Not heard any queen doing it, though. The king in disguise and encounters with commoners are themes of ballads and folklores. Some of the kings even fond his love interests in such encounters. Good for some.

standard. It is not for luxury or vulgar display of wealth. In fact, the mandate will be against them. The character of the society is also important. Is it farming, peasantry, industrial, religious, radical or any other system? Aspirations will be similar, but approach towards economic security will be different. Economic development with an emphasis on jobs will be the average person's lookout. Agriculture, manufacturing, infrastructure and service industries related to key areas for employment and wealth generation should be the prerogative of the government. Non-wealth generation employments like the military and other armed forces affect economic security differently. There is no profitable armed force in history. Armed forces are expense entities for a nation. They are necessary, but, beyond the optimum, they drain off economic security of a nation. It is evident in militant activism where they prefer to outsource armed conflict—mercenaries are examples. It is interesting to note that financial management of militant activists is seemingly much more sophisticated and advanced than that of a progressive government in maintaining the military and other armed forces. Militants get maximum value for money in their activities. Of course, it is not a model to follow since the asymmetries are riddled with far too many variables. It serves just as an example in the arguments for economic security maximisation.

An annual GDP growth rate of 8% is considered good by governments in a national economy that generally comprises manufacturing, agriculture and services. A good economy means flow of investments. There is also an informal hierarchy in the economic stature of the world. From the economics point of view, the world is divided informally as first world, second world and third world. A friend from a particular country once remarked that they could well be called as the fourth world considering the prevailing economic apartheid. The first world's nations are counted towards economic security in some cases. In that case, it is democracy and capitalism that invigorates economic security. Capitalism had different boosters. In the first case, it was money based, but soon followed by industrial revolution that changed it to technology based. Then came globalisation followed by information technology changing it to knowledge based capitalism. The future, some say, could be socialism-based capitalism. According to some, a breed of capitalism-based production and socialism-based distribution may be a solution.³⁵ However, this example is not valid since socialism cannot be considered as a booster as in the case of money, technology and knowledge since it is an ideology, which was prevalent along with capitalism and other ideologies of the period. A booster has to be a driving force newly introduced under the system evolution. Even globalisation is not a booster as can be seen in a closer look. It is a conditional effect caused by knowledge expansion and enhancement. Future may witness merger of ideologies by necessity of economic security under the prevailing boosters serving as catalysts. There is a close bond between capitalism, economic growth, democracy and equity. There are examples that market freedom flourishes in a democracy—one of the reasons for

³⁵ Sinha, Y. "For the Meek to Inherit the Earth." *The Asian Age*, New Delhi. 6 August 2004, p. 13.

capitalism's preference for democracy. But what if the opposites embrace the same principles without changing the titles? The communists are already at it.

The end of colonialism after World War II created large number of new states, most of them poor and underdeveloped. They experimented with various forms of governments. Full-fledged democracies found it better to encourage cold-blooded non-democratic machineries in other parts of the world. They could exploit them. India was another example. It was a democracy that followed the socialist path for over three decades after independence. India realised that the model was not good and changed for good. The average annual growth rate was 3.4%. Unemployment kept rising. There were no basic amenities like health, education, drinking water, etc. Foreign investment was not tolerated. Mammoth public sector undertakings were making huge losses from the time they were established. India faced it all and developed the will to change, though it lost considerable time in the process, a heavy price indeed. The country is focused on disinvestment subsequent to the awareness that mammoth public sector undertaking can be a heavy economic load. However, disinvestment proposals too will face flak in the political struggles for a government to hold on to power.

Governments should be aware that efficiency is *sine qua non* for achieving economic growth. Democracy, according to popular view and right examples, is a proven system of government for economic security though messy and highly imperfect. There is nothing better. "Whether economic growth promotes democracy" is also a much-debated topic.

10.8 Optimising Economic Security

Economics is an imposing and perfect discipline. It is a prominent discipline that influences the daily lives of people. Economic security optimisation is not sector or people specific. It is nation specific for all types of people with an eye on global scenario in a very competitive environment. The process of optimisation has to be regulated within the interactive geometry of other elements for national security maximisation (NS_{\max}).

Market fluctuation is a key area that needs the attention of the government in economic security maximisation. Market plays on psychonomics greatly. A crash can be attributed to panic selling. The competent authority to decide on this issue may vary from country to country. However, their views are important compared to market gossip or analysis by other agencies. Concentrated selling may be an indulgence, but may not be the reason for market crash. The position regarding a government in economic security related to market crash will be the tried out methods in other countries—both successful and failed. It is not known whether a failed method in one can be successful in another, but certainly a successful method need not be successful again. The reason is the vacillation in human perception—psychonomics again. Steps taken generally are market stabilisation funds—which will call for massive corpus—that could be changed with a confidence fund to rein in

Table 10.2 An example of income dispersal—Great Britain (1964–2004) (Paleri, P. (2008). *National security: imperatives and challenges*. Tata McGraw-Hill Publishing Company Ltd. p. 168.)

	1964	2004
Annual salary	£1000	£27,600
Pint of milk	4 p	30 p
Litre of petrol	5 p	82 p
Dozen eggs	18 p	£1.4
Pint of beer	8 p	£2.15
Home	£3360	£170,025

investor panic. When market sentiments overflow into currency and debt markets, the crisis will become wider.

Markets are associated with investment opportunities for the people. A healthy economic system is where the people can invest for securing economic future. Salaried employment is not for life in any case. Future guides the psychological drive behind savings and investments. The government provides saving incentives and investment opportunities to people. The market should be capable of cheering the investors and not luring them. Power of knowledge is the backbone of investment. Knowledge usage is not to speculate but to earn and produce. This involves the share market, retail finance market, insurance market and mutual fund markets. In a healthy economic system, the share market has to be stable. The retail finance market should give loans that will not bring the people to the brink of sinking under mortgage or debt; it should power the growth for the banking and real-estate sector. The insurance market should provide multiple choices under innovative schemes. Bond market should weed out the weak players from the strong in a way the common investor can distinguish them. The market should provide tax breaks to the investor to encourage saving. As psychonomics play seriously into investment, controlling the apprehensions of prospective investors becomes essential. It is difficult, though, because, first, it takes a lot to study the market and, second, it is difficult to get away from the conditioned psychonomic behaviour.

While the world is going to grey out as life span extends, poverty among the old may cause a serious dent in economic security unless pension policies are not suitably modified. Pensioners may find the value of their income declining; non-pensioners without income will hit the fence. Welfare measures are not advisable solutions to economic security. Developing insurance and pension schemes as viable economical prospects for the future is an identifiable solution from the government's point of view. For the individual, the quick solution is to work as long as one can with ample savings for the old age. For this, the government should find ways of employment and employment to generate employment. The problems that pensioners will face in the future can be seen from a comparative study of income dispersal calculated for Britain in a 40-year span. It is given in Table 10.2.³⁶

Investing is as important as earning. It goes with interest rates. *The Economist* in a study has stated that low interest rates are not always the economic elixir they are

³⁶ Jones, R. "What A Difference 40 years Make." *The Guardian*, London. 16 October 2004, p. 27.

projected to be.³⁷ The benefit of low interest rate is to make credit attractive and thereby improve quality of life. Cheap credit may plough in money into business to start new ones or expand the existing one. So far that is good news. However, low interest rates also detract lenders. If they withdraw because of cheap interest rates, there will not be money to lend to the borrower. The gain of the borrower is at the loss of the lender. The lenders are those who got the money—those who warn and save. In other words, in a low interest regime, the borrower is the winner, and when the interest is up, the saver is the winner. Individually, it has to be assessed from the position one adopts—that of the borrower or the lender. An interesting aspect of this statement is the nullity of the overall gain—the borrower and the lender cannot win simultaneously. Therefore, it is a question of choice under governance. At national level, the correct approach is to balance borrowing with lending; otherwise savings will fall. The trade-off is between lending rates and borrowing.

Savings go close to investment and purchase. How much one should save depends on how much one should need. It is an individual question, a psychonomical one, but from the point of view of economic security, the national interests can be arrived at a common figure. People should not be an economical liability to a country like those who retire. If there are pensioners, their pension is a liability; if not, the economic decline of the old aged people is another liability to the nation. Both ways what comes balmy is the savings of the people. If wisely invested, the nation will be able to meet the present and future needs of the society. This is the amount scientifically arrived at that a person has to save from his income besides the tax the individual pays to the government for governance. The issue is again centred on psychonomics. There are certain nations where the people are averse of saving; opposite are others who are compulsive money savers. The action plans available to the governments, therefore, will vary. In economic security, the government is the decider for savings. While it is for the individuals to calculate the need for saving for their future, it is for the governments to open up saving schemes that will attract people with money to save.

Economic security has to cater for employment of people. Keeping the unemployed on dole is charitable dispensation that most of the nations cannot afford. The fallacies of unemployment like “machines may make people lose jobs” have to be erased. Many communities have lost out in employment generation by knowledge revolution because of their initial resistance to computers. Actually, technology revolutionises product and process by innovation. That means increase in productivity and all the goodies associated with it—quality, cost reduction, increased profit, more savings, more innovation, more profit and more employment. Employment opportunities have to be seen with an eye on GDP. The ideal ratio for employment in a sector will be proportionate to wealth generation. It is to be balanced. To assess this, collateral results have to be seen. For example, agricultural sector may contribute to certain percentage in GDP directly, but it could impact indirectly on wealth generation in educational system and research and development. These factors can

³⁷The Economist. (2001). *Economics: making sense of the modern economy*. Profile Books. p. 265.

be assessed separately for sectors or sub-sectors. The ratio, however, is not fixed since contribution of a sector towards wealth generation is a variable.

In global economy, jobs may leave a country similar to goods. There will be resistance. Mostly, it will be under political considerations. The topic of jobs is hot in political debates and discussions. Movement of jobs comes from the belief in free trade and values associated with it. If the value is high, it becomes a favoured choice. These changes are inevitable in economic evolution. The resistance will be seasonal. There is no way outsourcing can be prevented since its necessity has been established historically. Outsourcing is not a recent phenomenon. It is historically linked. Earliest incidence of outsourcing, perhaps, could be the period of slave trade and traffic. In the early days, outliers were brought towards the jobs; the new phenomenon is to send the jobs to the outliers, which is termed as outsourcing. In its real sense, outsourcing is when outliers handle a job for productivity with profit. It is localised outsourcing when the outliers are brought towards the job and externalised outsourcing when jobs go to the outliers where they are. The term “outsourcing” is specific to job in this case, not the people. It is the job that moves in external outsourcing. Externalised outsourcing was only waiting to happen to complete the economics of job cycle. It is part of a phenomenon that had a natural beginning. It cannot be erased by any government in the evolution of economic security. The governments, therefore, have to plan for employment of its citizens very carefully. Governments have three options:

- (1) *Employment related to the country within the country or abroad*—in this case, the people and the job are related to the state. Locations may vary. It is in sourcing.
- (2) *Employment abroad for another country*—in this case, people move towards jobs offered by another country. Such activity could also include working for another country in a different country abroad.
- (3) *Employment within the country for another country*—in this case, jobs come from abroad to be executed within a country: call centres, medical transcriptions, service provision as in medical treatments, etc.

Choices 2 and 3 are outsourcing. In 2, people are outsourced (localised), and in 3, jobs are outsourced (externalised).³⁸ Both ways nation generates wealth through employment. From the point of view of balancing jobs, a nation has to see that

³⁸Note that the term localised is more specific than internalised. A term that many Americans use to express the job loss by outsourcing of jobs elsewhere outside the country (externalised) is “Bangalored.” The US outsources good amount of IT jobs to firms in Bangalore, India that according to the Americans is a job drain and has been strongly debated as an election issue in the Bush-Kerry campaigns in the presidential election of 2004. Such outsourcing according to the principles of economic security should not cause any alarm. It is an overall healthy sign of globalisation of economic security. Alternate employment is a solution for job loss, though. The issue is incidental.

outsourcing whether localised or externalised is balanced to maximise wealth generation. This is the ideal situation. There are other means of balancing employment. One of them is finding alternate employment for citizens for jobs outsourced. Alternate employment will be necessary even for citizens employed in a particular job that had to be laid off seasonally—an example is the marine fisheries sector in which there will be seasons when fishing will be banned. There are also people displaced under developmental activities. Right management process has to be in place to balance jobs between the three choices available to a government to get the advantages in maximising economic security under win-win situations. Economic security is a highly amiable element for win-win situation approach.

The jobs could be in public, private or self-employed areas. An interesting and innovative diversion in finding employment avenues for people can be seen in the plan of the then government of old Andhra Pradesh, India (2004), in reportedly deputing farmers to Kenya to own and work in the leased arable lands under an intergovernmental understanding. This thought process does not fall under any of the three categories above. The deviation is in leasing out the land for farming and temporary ownership over it. It is different from sending people to identified jobs abroad. It will be a unique case of citizens of a country owning properties abroad and cultivating for that country and remitting income from the produce to the parent country under an agreement. Such proposals will function as long as retained as a win-win situation for both the countries. It is important to understand that win-win situation is the key in outsourcing too, whether it is people to jobs (localised) or jobs to people (externalised). The proposal to send farmers to Kenya, however, did not materialise.

In localised outsourcing, brain drain is quoted as a loss. The projected reason is that an education provided is not used within the country. Good education system is one of the means of providing for employment in any of the three categories above—the triple choice employment pattern. There is no loss here. Education is the bedrock of economic security.

Take the example of employment in a shipping company. A citizen of a country could be employed in a foreign going vessel under the national or foreign flag as per choice or demand. It does not have to be national crews for national bottoms under national or international norms. In the maritime job market, it will be based on demand and supply. It is an accepted practice. The word brain drain is not mentioned here. The term brain drain, though sounds like a deadly neurological disease, is a figment of imagination. Take the example of a landlocked country with high unemployment rate, which is a threat attractor for critical pronouncements besides other issues, and who has large number of citizens employed abroad in localised outsourcing—ranging from prostitution, domestic services to security services including working for armed forces. Imagine that this landlocked country could establish a world standard maritime academy for training its citizens for maritime employment world over. It will be a well-paid Choice 2 job market for the government as well as a subject that can prove brain drain actually has to be seen as an employment opportunity, the natural responsibility of a government. Any argument on the brain drain issue is also futile if the country's choice is not the first one—find a

job within. It is interesting to note that the maritime community of the world primarily comprises people from littoral states and not landlocked states. Nothing prevents landlocked states in tapping this huge employment market outside their country. The avenues for job should not be restricted to Choice 1 alone in a global economy.

In any employment market, the wealth generated supports global economy. The wealth improves the status of the country as a global economic partner. It also has contribution in the element of geostrategic security for a nation, provided such opportunities are effectively utilised. Wealth retention is equally important in economic security.

Another question is, “is it advisable for the government to be the largest employer?” It is not an issue that can be taken up unless the wealth generation profile is analysed. It could be acceptable if wealth generation is at the appropriate level. Hence, employment for wealth generation and wealth protection is useful provided it is over the breakeven figure that a nation has to calculate with respect to its sector-specific preferences. It varies for each nation.

People are important to economic security as the prime contributors. In fact even the definition of economic security can vary from people to people. Economic security for the labour force is income security and representations security according to the International Labour Organisation (ILO).³⁹ The wealth in terms of humans, the population, is very important. Humans are not resources; they are investment instruments for wealth generation in management. Human investment management (HIM) is the primary key for wealth generation and thereby economic security. For that purpose, they could be anywhere in the world. Their remittance is what matters to a nation and not their location of wealth generation. Humans as investment prospects in employment activities, therefore, form a nation’s core competence. Capital humans belong to the number that is available among population in trained professions, even if it is self-trained. The crux of the problem lies in the social order. Systems that admit and accept poverty and unemployment are avoiding economic security. It has to be clearly and cleverly planned. There may be people, work and tools. However, they have to be judiciously and cleverly matched for wealth generation.

Besides jobs, revenue and fiscal deficits are important in the agenda for maximising economic security. They relate critically to economic stability. They have to be reduced. In this case, deficit financing is an indicator of government apathy to incompetence and inefficiency, tax evasion or wasteful spending. It needs specific objective-oriented plan that will collect factors for reduction in course of economic progress. Elimination of revenue deficits and reduction of fiscal deficit are important portfolio functions for any government. In a federal system or close to federal systems, close monitoring of decentralised finances is necessary in keeping up the decentralisation process. Monitoring is not centralisation in finance. A country needs clarity in devolving financial authority between the agencies that

³⁹“Globalisation has Slowed Down Growth.” *The Hindu*, Chennai. 2 October 2004, p. 4.

handle finance—central, state, local bodies, organisations, etc. Unitary fiscal system is not advisable, because it is a centralised approach and goes beyond the canons of federal system. It will stifle wealth generation. The dictums of deficit reduction should be incorporated within the corporate and other economic governance procedures.

Another school of thought is that deficit is not all that bad, as it sounds to be. It is a conscious effort by the government in its economic policy to stimulate the economy. A deficit is about overdraft in certain cases and certainly not about excesses. Overdraft defeats time in economic security with a certain risk element thrown in. Often it is a manageable risk because it cushions shock and supports development against time. Secondly, deficit financing has been there for long, and so far it has not brought down the bourses of national economy to their knees. If a national economy had collapsed, it was due to many other reasons though traces of deficit could be spotted in the post mortem. The fact is that opposite of deficit is surplus and the laws of economics are clear such a surplus cannot be maintained without a corresponding deficit elsewhere. Hence, one has to live with deficit. Deficit is a debt. A well-managed deficit is a positive debt. While global economy is a closed system, the trade-off has to balance—world saving must equal world investment.

Atal Bihari Vajpayee (1924–2018), the prime minister of India (in 1996, 1998, 1999–2004), while expressing concern over the nation's slow economic growth in a conference in 2001, put forward a plan comprising 14 measures inferred as leading points towards economic security for the targeted growth of 8% in the 10th 5-Year Plan:⁴⁰

- (1) Correcting weak finances of centre and state
- (2) Downsizing government staff
- (3) Reduction of untargeted, non-merit subsidies
- (4) Power sector reforms
- (5) Boosting food production
- (6) Labour reforms on a priority basis
- (7) Financial sector reforms
- (8) Foreign direct investment promotion
- (9) Removal of red-tapism (delay in bureaucratic clearance and disposal)
- (10) Removal of deficiencies in judicial system
- (11) Disaster management plan to counter floods, drought
- (12) Population control
- (13) Devolution of powers
- (14) Pro-poor focus

In this multi-pronged formula, the hidden concerns were the mounting revenue expenditure and borrowings for it. Economic instability is harsh for a nation. Many solutions follow in overcoming economic debacles. For some, it could be

⁴⁰*The Economic Times*, Mumbai. 2 September 2001, p. 11.

development in education, health and infrastructure, unfettered investment flows by deregulation, efficiency in government outlays, etc. The suggestions should be pragmatic and result oriented. Government needs resources. It may have to increase the tax-GDP ratio considerably for infrastructure or as the government in India has brought out Project triple P: public-private participation in infrastructure.⁴¹ Even that needs money. Increasing tax-GDP ratio, if done by increasing tax rates, will cause trouble. Better coverage and compliance is an alternative. It is a difficult proposal. Because the method inertia in the management system—the accepted practices of the past prolonging for no specific reason—can block the efforts. Here again the treatment is partially through psychonomics. Whichever may be the chosen method, better utilisation of government funds is important. It should be easy for the government with commitment and firm policy implementation.

A thrust in the area of microfinance is what the governments with high population density can think of. But most of them are not daring. Bangladesh had successfully implemented the Grameen Bank principle that supports rural low-income people. Other countries where such banks exist have never been so successful. It is a matter of commitment and implementation of policy matters under supporting conditions. Microcredit availability can lock up hidden avenues if supported by post credit assistance. In India, it often ends up in suicides, as reported from farmers in deep debt and poverty.

Savings has a major role in maximising the economic security of a country. It is a psychonomical aspect at the same time. There are nations where the people are obsessed with compulsive savings. The governments could tap their potential easily. It may be rather difficult where the people feel otherwise. The government may find it hard to get them save. Promoting long-term savings and channelising the savings into equities and debt will encourage more mature debt market. Many governments support such ideas. The principle of investment governance towards economic security lies in retaining the investor confidence rather than maximising dividend accrual.

10.9 Economic Security Indicators

Economic security indicators (ESI) can mislead calculations especially while analysing national security index. The real economic security will not be seen if indicators are wrongly interpreted.

There was an incident in India where the starving parents sold two of their children for Rs 1100 (about US\$25) and 15 kg rice in the state of Orissa in

⁴¹Bamzai, S. "Triple P to Power Infrastructure Push." *Hindustan Times*, New Delhi. 18 February 2005, p. 19.

September 2001.⁴² The investigative journalist who bought the children gave a saucy report. One of the reasons that have been attributed among population explosion in India is the relationship of unit cost to marginal cost of family life. The marginal cost is high for a lower middle class family upward, whereas it is not so for poor classes because the child earns or supports earning—begging included. The case in point—the child sale—will take the cake. Children themselves have become saleable products in distorted economies. This is the pit of economic insecurity from where it has to be viewed up. This concept, therefore, is not depended on its height, but depth. How economically secure are the lowest? That gives the indication of economic security.

Capitalism, communitarianism, communism, socialism, naxalism, Robin Hood syndrome of rob the rich to feed the poor and make every one equal, etc. are methods the world has attempted to find solutions to the problems of perceived and actual disparity by deficit. However, still, there are people in the pit. Economic issues always bring up different vignettes for the same issue. That will make it difficult to understand which the real economy is and what the real problem is. It, therefore, has to come down to real indicators, provided they can be identified. These indicators will include those that point out to the problem and those to possible solutions. When stock market index dances on the electronic board as unsettled as ever, it may indicate market sentiments driven by psychonomic factors, not strictly by economic security matters. However, it can lead to loss or gain to many. The gain from the point of view of stock value increase is a kind of funny money for the company. Further, the stock can crash, and at a particular stage, the impact will be on the overall economic security. The dancing index of the stock market does not immediately indicate the fate of economic security. It may hide a warning, though. It may show some signs when it settles its rattling even for a brief moment. The indicator will tell where it is carrying the economic security index. Therefore, it is imperative governments watch the volatility of stock markets or, rather, accumulation of funny money.

Some of the usual indicators of economic security are the GDP per head, consumer price index, budget deficit, defence spending, stock exchange average, mortgage and lending rates, inflation, unemployment rates, attitude to savings and yield on government expenditure—education, health, farm extensions, social security, subsidies, rations, etc. Few economic security supporters that may need serious debates are as follows:

- The hypothesis that stock markets are distantly related to the real economy (volatility of a market is part rigged and part speculative)
- Psychonomic matters

⁴²Maira, A. "Knowing the Real Economy." *The Economic Times*, New Delhi. 17 June 2004, p. 6. The family rationalised their guilt by stating that it was the only way to save the children from starvation death. Strictly that is not acceptable since the children were sold by the parents for their own material consideration. It is clear in a disaster situation witnessed by the author at sea when a drowning woman clutching her baby close to her chest finally released it to save herself.

- Market-driven politics to people-oriented politics.
- Social harmony
- Empowerment of the underprivileged
- Safe and viable livelihood for all
- Equality of opportunity
- Employment guarantee with asset creation
- Family based programmes in family oriented communities like in India
- Food for work programme
- Public investment in agriculture, rural infrastructure, irrigation. . .
- Increase in the flow of rural credit
- Emphasise on small and marginal farmers
- Minimum wage assurance
- Correcting fiscal imbalances by eliminating revenue deficit and pruning subsidies to the privileged
- Financing the programme by direct taxes
- Regional disparities within a country
- Populist economics
- Tracking parallel money trail to contain yellow money
- Global disparities

In evaluating economic security at a particular time, much goes in the relationship between capital and labour, government and tax payers, industry and agriculture, globalisation and localisation (that changes into a compromise formula of glocalisation, mix of global with local), town and country (urban and rural), party systems, home and family, non-residents and residents, minorities and majorities, etc., specific to a country. Strained relationships between these entities damage economic forces.

10.10 Economics as Happiness Index

Money cannot buy everything. This is often told by those who do not have sufficient money they dream of. That is almost everybody. There is some truth in it, though it is a kind of rationalisation. However, money certainly cannot bring happiness. It can give a feeling of security. Happiness is not an indicator of national security for this study.⁴³ The lemma here is that happiness is different from security and security is again different from national security. However, it may be appropriate to see that all they are related to each other since the common denominator for all is the singular

⁴³ This study does not recognise happiness as a measurable concept or feeling (for more see Chaps. 2 and 3) appropriate to be a national security concept or even an element. Happiness is taken as a result of hormone balancing that could be triggered by various means other than governance under any conditions or situation. it is a feeling that make one act in a built up positive manner. There is no metrics for such feelings.

individual. Happiness is a fleeting feeling and not something that lingers on all the time. It has been proved that money and other social aspects can be related to that feeling though not always. The Economist Intelligence Unit carried out a survey in 2004 in an attempt to compare happiness around the world based on the principle that wealth is not the only measure of human satisfaction. The index of 111 countries combined data on incomes, health, unemployment, climate, political stability, job security, gender equality as well as that the magazine calls “freedom, family and community life”. Well, all these ingredients speak of one thing—money. Here is an index of happiness basically, not national security. If not in the palm of the individual citizen to feel happy or not, the nations certainly need economic security to provide for all these. That is where economic security comes in the intricacy of happiness (Box 10.3).

The study showed Ireland the happiest country with a score of 8.33 on a scale of 1 to 10. Switzerland had a score of 8.07 and the UK in 29th place at 6.92, narrowly in front of South Korea. Zimbabwe was the worst at point 3.89. It had problems—political insecurity, hunger and everything else that can take a smile off the face—really? Even the poorest of the poor could feel the whiff of happiness at very special moments—that is what the psychologists say. Ireland’s reason to be on top was that it enjoyed the highest rate of all factors that assessed happiness. It had the 4th highest GDP per head in the world, low unemployment, political liberties and preservation of cozy elements of the world—stable family and community life. In other words, it was the old and new combination in a compatible manner that the surveyors found out as the new formula for happiness. While China was at the lower half as the 60th, Russia slipped to the bottom as the 105th. Another report last year by the New Scientist showed Nigeria as the happiest nation followed by Mexico and Venezuela.⁴⁴ The most miserable (unhappy) were the citizens of Russia, Armenia and Romania. But, were they?

Box 10.3 Happiness and the Economics of the Caterpillar Fungus

Bhutan, the small and beautiful landlocked Himalayan country, mountainously sandwiched between China and India, follows national happiness index to assess its national stasis. Bhutan, within its exotic and exclusive geolocation and associated limits, thrives on many things to keep itself happy, though economically unsound but growing fast. The western practices induced lifestyle in Thimbu, the capital city, the monastery dedication of the extremely poor to find comfort in religion and human service in the quest for food, living with the domesticated yaks and the mountain life where the young Bhutanese trek for days to gather the most precious parasite in the world, the caterpillar fungus also called the *yarsagumba* in the Himalayas and *keedjadi* in India, all contribute to the self-contented lifestyle where happiness certainly is natural, not fried in economics.

⁴⁴“Ireland is the Best, Zimbabwe Worst.” *Hindustan Times*, New Delhi. 19 November 2004, p. 22.

10.11 Mountebanking in Economic Security

There are two critical areas where economic security interventionists (not economists) have to be extremely careful—psychonomic impact of their decisions and actions and falling victims of mountebanking. Psychonomics is explained in a subsequent section. Mountebanking is an old term which is very valid in dealings with money. It is about economic and financial cheaters, fraudsters and charlatans. Economic security takes a retreat in every aspect of financial consensus when it falls in the domains of the money peddlers and fly-by-night operators. It is wizardry of funny money thereafter. There are many companies, projects, charitable organisations, trusts, cult operations, businesses, investment and banking dealings, etc. that are managed in this manner. Some of them are state sponsored. They run with the ethics prophesied externally. Internally, it is a matter of diverting currency for vested interests. In this process, the common public as investors gets deceived under brand equities. Mountebanking the public is a common feature in most of the financial dealings in the world. Assurance of the government against such peddlers of money will promote confidence among people and thereby complement economic security. Basically, economic mountebanking is cheating the people of their money directly or indirectly in a way that they do not easily come to realise. It is the way many public corporations and private operators use public money for private gains. It is the basic crux of many organisations where the access to funds is only for a select few at the top.

Mountebanking could take refuge under corrupt practices. Corruption is a scourge of economic security. It is a behaviour pattern applicable to the entire humankind. The opposite argument is that corruption fastens economic growth, as policies are short circuited by those in authority. Whatever may be the argument, the root of corruption lies in the pit of perceived insecurity. It is strong enough to blow up the entire economic security programme of a country, especially in a politico-bureaucratic system where everything is decided on toxic money. The government may be able to manage the system to a considerable extent and make it corruption free. It is a gargantuan task, though. Feeling of insecurity can make people forget ethical priorities.

10.12 Economic Warfare and Economic Security

Economic warfare is the act of involving “an economic strategy based on the use of measures (e.g. blockade) of which the primary effect is to weaken the economy of another state”, according to Oxford dictionary. The subject though widely mentioned in conversations needs to be used carefully as it is not understood how the relationship between economics and warfighting can be established. In fact economic warfare is meant to weaken the enemy economically so that it cannot fight a war. There are quite a few other situations which are actually strategies that are tailed

with the fashionable term war. War is a serious matter. It opens out on a terrain with no mercy whatsoever to players. Serious semantic dissonance can upset the outcome. It is worse in governance as governance is the macro level subject in any human system. War is part of it. Strategies and tactics should be silent in war, unless making the adversary know is deliberate. Does the friendly neighbourhood mafia or yakuza uses economic warfare to eliminate their human targets? Nay. . . they simply chop or shoot. War involves money, a lot of it and a lot of blood. More than what flows in a neo-noir Tarantino film.

It is true that economics and military security are very much interlinked. “Countries invade and colonise for “money”; they also need money to invade and colonise. Someone mentioned that war should be treated like an investment. It can yield money, not just loss. But military security is not just about war (Chap. 9). The prolonged undulating explanations so far were to highlight the term economic warfare has nothing to do with war. It is a considered strategy to prevent the economic-political adversary from stretching economically above the state engaged in it. It is a kind of economic anxiety which a nation should think seriously in the long and short of it before considering, because it can cause a serious loss-loss situation that is the worst scenario in any duel or engagement of the fall out kind. Managing money including denial to another is a strategic or tactical application of governance. Hence, economic warfare is more appropriate as economic strategy. Economic warfare, therefore, can be highlighted as competitive economic strategy to destroy the economic security of another nation. The term war is a misnomer. Therefore, this study recommends the term economic warfare, if intended to retain, may be redefined as a strategy to deny economic security to the adversary. The argument is that economic warfare cannot be said to be following the profile of war and also the effort cannot be used as war directly to defeat the opponent economically and induce insolvency of the national kind in surgical fashion. The best strategy in modern times in economic security is to make the other economically potent so that a negative move on its part will be self-defeating—a kind of golden goose principle.

The protagonists of economic warfare in the world view the subject linked with military operations, especially in the areas of resource denial, technology denial, covert operations and other techniques that drain off the will of the adversary to compete and fight. It is in the belief that economic constrictions can damage the will and ability of the adversary to fight war. However, the argument here is that economic warfare as a topic projects military connotations associated with war and not as a part of economic security of a country. The economic security of a country is not based on the economic insecurity of another. Creating economic insecurity in a country is not a recommended plan or identified target of economic security optimisation governance. In fact, it will be better if the other country is also economically capable so that the countries are mutually benefitted. The US–Canada–Mexican agreement on free trade called the North American Free Trade Treaty (NAFTA) that broadened the arrangement on free trade between the countries basically aimed at bringing this balance among them is one of the objectives carrying the belief that illegal immigration to the USA could be contained if Mexico picks up

economically through trade. The trilateral agreement came into effect on 1 January 1994 superseding the then existing US–Canada bilateral trade agreement. In September 2018, the USA, Mexico and Canada reached an agreement to replace NAFTA with the USA–Mexico–Canada Agreement (USMCA), and all three countries had ratified it by March 2020. It is conveniently called NAFTA 2. The catch here is the US president's insistence in spite of such an agreement to construct a border wall in the Chinese mould which of course did not work the way the not so long lived Emperor Qin She Huang (Chap. 2) perceived in misplaced defensiveness.⁴⁵ It means either NAFTA is not working to economically balance Mexico or the thrill to migrate into America is stronger than the outcome of the agreement, or in a bigger sense it is a power projection for America to have a modern wall across its boundary with Mexico. It will look good as a power barrier. It also involves big money. In economic security, any expenditure by the haves is welcome as it allows the flow of money.

Playing economic warfare with all the countries in one go is not easy. Besides, it can be counterproductive as the countries may look in different directions for support, and other countries may come for help. The idea of economic warfare as a strategy is given a second thinking based on the realities of the overall international security in line of national security. Economic warfare also overlaps in other elements. Hence considering the topic as inclusive of economic security is not recommended. The purpose of including the topic in this chapter to highlight the fact that economic warfare even if included in strategic approaches is not a serious part of economic security, but some of other elements such as military security, resource security, geostrategic security and suitable others are appropriate to the time and period. Economic warfare also includes various other procedures such as blockade, sanctions, blacklisting, preclusive purchasing, capturing and controlling assets of the adversaries, suspension of aid, freezing of capital assets, prohibition to investment or other capital flows, expropriation and so on.

In conclusion, the concept of economic warfare in this study is considered more as a strategy or remedial tactical measure to solve an immediate issue of conflict in geostrategic context and hence a strategic or in some cases a tactical term as part of the element of economic security. It is not a coercive or reprimanding application. Damaging or destroying another human system economically is not a good strategy or a practice in sustainable management of global system in which one's own survival is also included.

⁴⁵The wall did not defend China like the way the Emperor wanted. It is just a security blanket. The wall was breached many times. It stands, even though breached in the past, as a megalithic power symbol of China.

10.13 Velocity of Flow of Money: Critical Factor

This is a proposal from the author with reasonable belief in its practicality and a topic that requires serious research on the money trail, to establish the velocity of flow of money relative to an individual entity—individual human or individual group including a nation or the global system. Money flows at a varying speed changing directions through the system. Unlike the blood flow in a body, money can flow playfully in any way in a human system. Half the job is done if the governments can appreciate the higgledy-piggledy flow of money at any time. This is not about economic intelligence, but intelligently appreciating the state of economic vector at any given time. It could help to oversee money flow in the system. The government needs to control money as well as its vector to streamline the flow. Presently, it is only money control in governance.

Money flows through the monetary gradient. It is in the hands of the government to create it in an optimised manner to regulate the velocity of flow of money. The author intends to examine this design further outside the scope of this study on national security. The firm belief is in the applicability of the theory in governing economic security by establishing the money flow in the system. This is expected to support every aspect of what a serious and responsible government wants to do with respect to the economic stasis of the country and the consequent well-being of the people. Of course, the study is also expected to turn around personal finance and economics to the optimum advantage to the individual. The term individual in this study also means a group when viewed exclusively as an entity. A nation is an individual entity. Velocity of flow of money is the vector in which money moves from one palm to another, where the “palm” is the point at which the velocity of flow of money is measured and direction established. The palm is a two-way money valve through which money can flow any time undisturbed. The palm can take various shapes as ports of money receptor or transferor. Unlike a two-way technical valve with two ports, which has to be opened and closed each time to reverse the direction of flow of the fluid, the money valve can be used both ways at the same time without a valve to make passage to the ports. Money is not a fluid. It is a convenient means that psychonomically spikes individual needs and wants in a human system. The potential difference that supports the flow is a combination of the economic environment and other factors with specific override of psychonomic factors relative to the subject permitting the flow. The palm is a part of the valve through which money passes in and out (earning and spending) and, as mentioned, where the flow is measured. The money can flow both ways simultaneously without hindrance. It is psychonomical. Inward flow of money is not blocked by the outward flow. The flow is also not diverted on different lanes. The lane is the same without any chance of hindrance to flow. A person can earn while he or she spends and vice versa. The author considers vectorial appreciation of money is one of the ways to appreciate the economic state of money in the environment at a particular time. This particular stasis and procedures to assess money trail already exist in the economic and financial systems including taxing, costing, pricing, accounting, auditing and

economic law enforcements, though not specifically marked out as a topic of study. The intelligence agencies focus on the palm to understand where the money comes from and to where it goes in specific cases.

There are people who may say an itching palm is a sign of money to come—an immediate income from a not so certain source. It comes from the psychonomical eagerness towards inward flow of money, oblivious about the creepy fungi causing the itch in reality. People welcome income relative to expenditure unless a shopaholic or a spendaholic. It is psychonomics again. However, in general, no body appreciates that money spent by one is that flows to the other as earning instantly. The money spent, not earned, therefore, is a better sign of affluence. Generally, the time between earning and spending is more than spending and earning. This span in the former is called saving, and the latter is spending. This fact also regulates the velocity of flow between the two phases—earning and spending and spending and earning. Encouraging spending could be a better policy of governance provided the stability of money flow is maintained. There are many ways of doing it.

Velocity of flow of money is a sensual experience (psychonomic) as well as a metric. It is also a technical assessment of the time and quality factor linked with earning or spending money. The two data together can improve the efficacy of decisions; it is expected. The common person does not appreciate GDP or other economic terms that explain his or her state of financial stability with respect to his country or the world. The individual certainly feels the way money moves through his palm even if he or she is dealing in virtual money. Measurement of that state can give a hint to the government as well as the individual about what to do next. It does not come from the percentage of inflation, GDP or currency fluctuations though all these terms and calculations are necessary for experts to assess the economic status of a country.

The major change in the economic principles which the author adopts here is that money is not a scalar but a vector. The direction matters whether it is individual, national or global money movements as income or expenditure. The velocity as well as direction of flow of money is critical in the study of economic security, and the government has to act exactly like a sensory governor in a dynamic system to regulate the velocity when in excess, under or altered direction.

10.14 *Eenampeechies* of Money: Illuminati Paradox and Outgrown Lazy Money

Eenampeechi is an expression in Malayalam, the language spoken in Kerala, the southern coastal state of India. The term is not overly heard nowadays. However, it is used to shiver the timbers out of Keralite kids once upon a time. They are all grown up now. Many would have aged and vanished into the intrepid world, perhaps in search of what frightened them—the *eenampeechi*.

The legend of *eenampeechi* was strong. Children would make up the *eenampeechi* as an ugly short figure with a tail, sharp claws, long protruding tongue and a body full of hard scales. The *peechi* (shortened to pronounce easy in this book) had no concern for its innocent victim. It was a monster in the imagination of children. Way later they will realise it was nothing but a harmless anteating Indian pangolin that had created the fear being a rarely seen animal in the outskirts of Kerala. Pangolins even otherwise cause a phobic yuck factor in many including the author. There could be similar *peechies* in the economic world too with a place of reference in economic security. The study on velocity of flow of money stumbled on something in similar lines—the *econopeechies* of outgrown lazy money, the cause for many conflicts in the world along with a few good things in support of governance.

The economic *peechies* are different. They too exist as mysteriously today in the grapevine, but not as harmless. They can cause trouble in governance and human systems if they get involved. Money is an individual matter at the bottom of all quests for power. It is a psychonomical paradox. Money flows through the human palm randomly in various streams (including virtual stream today) at differing velocities. Theoretically, it is a closed circulatory system like blood circulation in a human body. In reality, it is not. An open system can kill the living unless controlled. For example, the blood may be diverted into a bottle in the blood bank. In the economic system when the flow of money becomes uncontrollably fast in the suction line, the reservoir opened to the delivery line at the bottom gets overfilled. That is beyond its normal flow. Accumulation of money creates a kind of money stagnation in the palm owner's reservoir and makes the person illuminati with excess lazy money that the individual may have to belch out as if in economic gastritis. The belching happens on a different track that cannot be governed easily. Even a government could get overthrown in its force of reflux before it could spell Jack Robinson.

Illuminaties are powerful, because they got a lot of outgrown on overflowed lazy money. Money need not make one happy, the wise old humans say. Of course the statement could also be made by people as an excuse for rationalising lack of it. However, certainly, money is the symbol of power distributed through politics and faith, the binary axes, on which the human power system churns as if in a centrifuge. Money is the chosen symbol of power to rule and make people submit subliminally and otherwise. The binary axes of the day, politics and religion (faith), need it, a lot of it. That can flow from the outgrown lazy money pools of the economic *eenampeechies* of the illuminati variety. And, who are these illuminaties or the *econopeechies* of this study?

A young little girl once told the author in a hush-hush tone as if someone was listening, "Uncle, do you know the world is not controlled by (national) governments? They are controlled by the Illuminaties, the gangs of a few secretive people. Nobody has seen them or knows them, but the governments all over the world are under their control; they have to listen to them. No government can survive unless they submit to the illuminaties". The girl was true if the term illuminati can be rerolled to the people who are excessively rich, close to the Conqueror Emperor

(Mansa) Musa I of the erstwhile Mali Empire. His empire produced more gold than anybody else. Mansa Musa I (1280–1337) is considered to be the world's richest man so far. It is possible considering the chances of overflow through the suction head of the money line under the velocity of flow of money principle in that era. It is not as much possible today under regulated governance the world over. No one so far has a larger reservoir of money than him. However, people can still become mini musas. It is very much possible under the natural process of psychonomics. That is when the closed loop in the circulation system ruptures like a vein under increased blood pressure or a dam under the pressure of water causing unregulated floods and associated collaterals. The damage to the system will depend upon where the burst affected. Economic illuminaties or *econopeechies* can cause monitory haemorrhage in the economic system. The problem of outgrown lazy money will not be limited to a nation or a geoentity. It will impact the whole global human system that is yet to be a defined system. This is visible all around. The entire people of the world will succumb to the money jam. It happened in the Musa effect in 1324. Musa's open loop belching during his pilgrimage to Mecca was in the form of outlandish and extremely copious spending. It crashed the gold prices to the bottom pit and shot inflation to never imaginable heights in Egypt, Mecca and Medina, which some scholars believe were their geostrategic show of economic strength.

Kerala, where the term *eenampeechi* originated, is branded "God's own country". However, strictly, according to the author, it could be called "gold's own country" considering the weight of gold in the sociopolitical scenario. It is not known how often God visits the state, but gold never stopped rattling it out since the time the Roman's brought it down and exchanged them for spices in the long tradition of Indo-Roman trade entanglements which, however, is not supported by concrete evidences. Researchers hold different views. However, the craze of the rich with outgrown lazy money in Kerala in the early times, it is reported, had made Roman senators strongly voice their opposition to draining the Roman gold to Kerala calling Rome becoming a consumer state, a sure sign of outgrown lazy money and unplanned spending.⁴⁶ The hard money that came from Rome as gold never returned. They fed the reservoirs if it was true. This may not show that India traded with Rome, but certainly highlights outgrown lazy money model as a continuation from the past. If that is so, the illuminaties may exist in the world with excess lazy money but under control from governments and the global monetary imperatives. The spending from illuminaties will take different trails flowing into the binary axes of power—politics and faith. It will keep Mensa Musa the richest human ever in the history of human system as no one will be able to maintain a suction head of money into the size of Musa's reservoir under the present system of governance.

⁴⁶Parthasarathi, P.T. "Roman Control and Influence on the Spice Trade Scenario of Indian Ocean World: A Re-Assessment of Evidences. *Heritage: Journal of Multidisciplinary Studies in Archaeology* 3: 2015. pp. 581-94. According to this citation the trade was not directly between Rome and India's west coast but through intermediaries such as Arabs an Auximites (Northeastern Africa comprising Ethiopia) who fed the Roman market.

10.15 Psychonomics: Thematic Inconsistency

Psychonomics is a theme in the study of national security. It is more than a term. The problem, as mentioned in the beginning, is that money behaves differently when it passes through different palms. There is a human behind every money transfer that triggers the flow. It is a reality factor to take into account at the planning stage of economic security. It is for the government to decide. Money is part of the perceived security assurance package though never fulfilled to the desired measure for an individual or a group. This statement is applicable even for the richest individual as well as a group (read nation). Psychonomics in fact induces the demographic factor of human behaviour that may leech into economic decisions. Humans think. Money makes them think more seriously than many other factors because it is a sign of perceived security also. Money provides confidence and thereby feeling of security. People love to “count” money. People’s attitudes and familiarity with money will change, but psychonomics as the baseline behaviour pattern with money will remain. The demographic aspects will transform behaviour patterns of generations towards money. The expected behavioural changes are not in spending alone, but also earning. In this scenario also the flow money will be a key factor in economic security. The direction does not matter seriously. Velocity of flow of money matters to appreciate the spread of money in the system.

Psychonomics can be a problem for those who believe in the straight line principle of economics like the demand-supply model. Look at it closely. It is simple but a majestic X graphic through which every economist is initiated into the intricate subject in microeconomics. Now imagine it is not an X but the dynamic profiles of two dancing snakes crossing across on a base line at about 90° angle or curve with no similarity of any kind anywhere on the line except in the overall jumbled shape of X. Everybody knows the crossing point is called the equilibrium point in relation to price and quantity. That is fine. Is it universal that increase in price of a commodity will reduce the demand? If not, why? Is there something happening with human vicissitudes, the mutability of human desires and perceptions? Is it the clash of needs and wants?

The supply and demand curve, the foundation talk on microeconomics, is the most ridiculous graphical symbol in economics for the author. At the same time, it is very critical for the study. It will not be possible to make it behave without the application of the psychonomic factor. The universal supply-demand graphics of microeconomics is sans the application of psychonomic factors. Though difficult to embrace totally, it is an excellent model to explain the concept that makes it universally acceptable. Look at the previous section that mentions the velocity of flow of money. There is thematic inconsistency in money flow. It is caused by psychonomics, the behavioural aspects of people in dealing with money—earning and spending. Velocity of flow is held to be on a straight course in a fixed direction similar to the flow of water in a well-designed canal. That is what anybody will think. The term, velocity of flow, gives the feeling that money flows uninterruptedly in one direction if it is there as if from a storage tank. It may get either obstructed or

flow either freely or in a constricted manner. However, that is not the way money flows in reality if psychonomics is applied in each step of money passing through human palms. It cannot be. It is extraneous to the constrictions in the flow of money—absence of it, quantum of deficit, restrictions by law, inability to spend. . . There are many ways money flow is restricted along the line. However, psychonomics induces different kinds of constrictions. Money changes its velocity and direction at every palm it reaches. . . It is like driving consciously with the foot subconsciously on the clutch. It is a constriction that nobody takes into consideration while planning money flow in a human system. It is a function of time. It is like a train changing its velocity and direction at every station in an unplanned manner—similar to aimless wandering passage without stopping. It will be difficult to make a time table for the rain under such circumstances. Such system does not exist. Psychonomics could be better explained in the randomness of a soccer (football) game. The soccer ball goes through systematic randomness in a match every time it passes through a foot. The players are careful not to push it outside the field of game lest they should lose time. Well, almost. However, the next direction and velocity cannot be predicted. The only difference is that every touch is to be taken as at a different foot in soccer, whereas in psychonomics, the individual's personality at the time matters. This metaphor is used since it is a perceptive exercise of randomness not easy to explain. The flow of money is like the flow of water not through a streamlined pipe but through a canal with many junctions, weirs, venturies and orifices. The velocity of flow of money is quite complex. Psychonomics contributes substantially to this complexity.

10.16 Colour of Money

The colour of money is not green, red or whatever shade it is printed. So, it is not about give me green or red. It has been said that the USA preferred green colour to print its currency because green dye lasted long. Not sure about it, though. Normally any dye will outlive the money that becomes dirty when passes through not so clean hands. Many of those hands pick noses and scratch whatnots. No one knows it better than a virus that takes advantage of the human hand for a majestic entry into the host and his or her friends. The hand is the holder for money too even in virtual where the keys play hands.

The colour of money mentioned in this section is not about the good looks of the currency notes which makes one say with pride, "Gee, my country's currency is more colourful than yours". However, at the same time, the value of the currency for national security is in its colour of a different kind. Looks do not matter in currency valuation. However, the colours do matter from the government's perspective of planning. Moreover, these colours are not visible. What are they?

Money that flows in the country is the bloodline of economy and the sure fire indicator of economic security, if it is proper and legitimate. The government should

know about it at any given time. For governments, it is the circulation of money. The appropriate colour is therefore important for explanation.

Illuminating the importance of money flow within a country can be made interesting to a thoughtful reader compared with blood flow in a healthy human body or the waterline within a town.

Every country has a name for its currency. It will normally have a history. Some of the countries use other country's currency. For example, US dollar is a widely used currency in quite a few nations. 19 countries among the 27 members of the European Union use euro as their sole currency. In all cases, the currency of a country is backed by the full faith and credit of the issuing government and its reserves and systems for money management.

There is no global single currency for all. Currency is a big divider of national humans. The world is simple but has to remain fragmented to accommodate the differentiability of the humans and the human systems framed in singularity like a collective collage. They are more like marbles in a huge cookie jar. Why marbles? Because they are identical as nations for this study. That is how human systems started; that is how it will go along for many years at least. The end is not visible on both sides. So the term global currency can be now reserved for the reserve currency on which other currencies may find their relative values in a boisterously active but oeconomicus⁴⁷ world. Every person in such a world keeps a polyamorous⁴⁸ relationship with money. The money one touches has been touched earlier. That is as simple as it could be. There is no question of chastity about the money one handles.

The currencies of the world are related in differing seriousness. The dominant currency in this regard is the US dollar since World War II. Such currency is called the reserve currency. Reserve currency is maintained by the central banks and other major financial institutions to prepare for investments, transactions and international debt obligations or to influence their domestic exchange rate. A large percentage of commodities, such as gold and oil, are priced in the reserve currency, causing other countries to hold this currency to pay for these goods.

Earlier the currencies were conveniently backed by gold kept in reserve. The gold with country backed its currency in circulation. It was called the gold standard for measuring each currency. World War II changed the scenario. The USA was the most benefitted country of World War II. It became the most powerful country militarily and economically and earned the much used name the superpower after the War.

The gold reserves were cumbersome to gather and hold and were not supportive to handle currency matching the speed of advancement of the world post World War II. Banks could not conveniently hold enough gold reserves to back the growth of the

⁴⁷The *Oeconomicus* by Xenophon is a Socratic dialogue about household management and agriculture and early depiction of the subject of economics.

⁴⁸Polyamory is the practice of, or desire for, intimate relationships with more than one partner, with the informed consent of all partners involved. It has been described as "consensual, ethical, and responsible non-monogamy. The author here compares the relationship of money with human is polyamorous

currency, which was needed to finance the global expansion further. Consequently, the USA disconnected from the gold standard and began to print more paper money to finance the world's growth requirements. The USA was a powerful economy and could influence the world to accept the dollar as legitimate tender by waiving off the gold standard followed so far. Thus, the dollar became the most dominant currency, and almost all commodities came to be quoted internationally in US dollars. There is also an implied sign in this turn around on currency backing that any currency in the world that is powerful enough can become a supporting currency for world economic development in the future.

The value of the currency of a country can increase along with its economic advancement. This is another rousing factor for nations to focus on economic security. This will create currency blocks in the world with specific currencies holding value of importance in each block. The value of dominant currencies will keep fluctuating. The next change in the world on currency back up in all respects could be multi-currencies including virtual currencies. However, dollar is expected to dominate for a very long time. Successive governments in the USA will have a hard time to hold on to it. The problem associated with the present system is that a country whose currency is not dominant as a reserve currency may have to handle cross currencies to do business across their borders. There are many cross currencies today which collectively indicate possibility of amalgamation into multicurrency domains.

It will be interesting for other currencies to examine how the US dollar became the reserve currency.⁴⁹ But before that one should know about the sociopolitical passage of America through time and money. America was not on the economic horizon of the mainstream world before World War II, especially after going through the great depression (1929–1933) that shook the country and many others hard from their foundations. The country entered the twentieth century as a relatively undeveloped struggling insular economy. Though it had a boom around 1920, it was washed away in the depression that came in a decade. America's foundation was systematically carved post-independence movement (1775–1783) (American Revolution) and Civil War (1861–1865)⁵⁰. Every nation has gone through turmoils of their kinds in the past with certain similarities. However, the story of America was very different. This difference still permeates whatever it does, now as a superpower.

⁴⁹The first one-dollar bill was issued as a legal tender note in the US by Salmon P. Chase, the Secretary of the Treasury under President Abraham Lincoln. It had a long history of transformation since then.

⁵⁰Due to disaffection with British colonial rule, the 13 British colonies that make up most of the current eastern coast of the USA rebelled against British rule in 1775 and then declared their independence on 4 July 1776. The 1783 Treaty of Paris brought formal British recognition of the USA. The Civil War came much later primarily as a result of the long-standing controversy over the enslavement of black people. Many generations have lost their existential survival before, America, came back to life thanks to its economic strategy during World War II—making money in a war where everyone else lose. It also made the country a superpower. This is the argument that the way to superpower status for a country is through economic security. And it could be the overall national security to superstate status.

The USA did business with allies during World War II and got paid in gold which made the country the largest holder of gold. Gold was primarily the medium of large exchange then. The currency, the US dollar, got linked with gold; other countries linked their currencies with US dollar. In short, this ended the gold standard keeping reserve status on the US dollar. Majority bank reserves today are denominated in US dollars, and a good share, almost half, of the world's debt is in dollars. These carefully, not accidentally, acquired formats do not give any chance to other currencies to dominate the monetary jungle unless the world goes through a major global economic shake. It is possible; others are not quiescent. A stable route to the stasis of a dominating entity is governing by national security. That is the ideological way to the status of a superstate which is expected to be more stable and powerful than any superpower. Such a stasis comes only through national security governance. There were no superstates so far in the world. A superstate is not a utopian dream. It is a reality model that could challenge utopia of any kind. It is a tamable moving target.

The colour of money in national security is not based on the dye used. Money is not just paper. It comes out in metals, plastics, virtual.... There is nothing new about virtual currency. It has been there with human system as representative money throughout. It reflects in every situation of employment where an individual functions for a consideration in terms of money as wage, salary, interest... The expectation of income is virtual until it manifests in metal, paper, plastic, electronic... The virtual money as called today is the electronic representation of monetary value of one kind or other. Virtual currencies, as they are called now, are often represented in terms of tokens. Many are unregulated without a legal tender. All these matter in the singular aspect of the colour code that this book gives to money. That is the lane the government has to take—white, black, yellow and grey.

This brings this chapter to the bottom of money matters that a government should delve in besides governing economic security under the dominating world currency. The velocity of flow is about the appropriate currency, the currency that the government is aware. Any other currency in circulation will topple the economic plans of the government. The appropriate currency is the currency in the country that the government is aware of as the rightful money. This awareness comes from the taxation of the system besides other statistics that the government will have about printing and minting money in currencies and their circulation. However, the unlawful evasion of taxes by people creates confusion and gives rise to what is called black money. Obviously, the appropriate money that is in the counting of government is the white money—the money that is not black.⁵¹ In India, black

⁵¹ In India, black money is funds earned on the black market, on which income and other taxes have not been paid. Also, the unaccounted money that is concealed from the tax administrator is called black money. Black money is the money that is concealed from the government by those who earned it to evade tax where it exists. In March 2018, it was revealed that the amount of Indian black money present in offshore banks is estimated to be Rs. 300 lakh crores or US\$1500 billion. White money is the income that one generates after paying taxes as per the provisions and can keep openly in his bank account and also spends it in any manner he wants. On the other hand, kickbacks, bribes,

money is funds earned on the black market, on which taxes have not been paid. The unaccounted money that is concealed from the tax commissioner is also black money. The money that originates from the business conducted with a mix of white and black is termed yellow money (Paleri, 2002). It is similar to jaundice caused by drinking a mix of clean water contaminated with sewage water. It could also be white or black that could be identified to some extent by avoiding double accounting. The government or agencies will not be clear about the black money except in estimates. In addition, there will be counterfeit currencies—grey money, in circulation. They are printed as exact replica of currencies in circulation, unlawfully by people or subversive agencies. The counterfeit business as a deceitful weapon of war originated during World War II seriously by the Germans to economically damage the allies. Counterfeiting money is as old as money itself.⁵² Unlawful is the shadow of lawful taking birth almost simultaneously which is also the basis of origination of threat-target duo mentioned earlier.

Counterfeit currencies are considered to be one of the economic warfare strategies in the ultimate fraud. Money other than appropriate money reduces quality of economy of the nation.

Weak governance is the root cause of inappropriate money in a country that naturally leads to decline in overall economic security and thereby economic vitality of a nation besides impacting other elements of national security and the overall national security, the well-being.

10.17 So, What Is Economic Security?

Economic security, in this study, is the second identified element of national security in the chronological hierarchy of 16 elements. Economic security, “econosec” in short with the symbol “ e_{s1} ”, covers all the strata of the economic pyramid in the human system of a nation.

The economic pyramid mentioned here does not hold people under the expression of the haves and have-nots or similar terms. The term “haves and have-nots” is an idiomatic expression where the have-nots are believed to be poor and haves are not. Such usages have confused people for generations and even given birth to various political and religious belief systems where people are exploited by those who are more influential. There are similar expressions of imagination and manipulation—

money earned through corruption, and money that has been saved utilising unfair means is called black money. Indian black money. Wikipedia. https://en.wikipedia.org/wiki/Indian_black_money. Accessed 10 January 2020. The entire rupee in black money will be much more than this amount.

⁵²Records from Ancient Athens, (449–413 BC) shows multiple ‘test cuts’ which were commonly made by suspicious minds in antiquity to detect forgeries by assessing whether the base metal underneath was the same (silver) or a cheaper metal (e.g. bronze). This coin has silver beneath and is not an ancient forgery. Counterfeit money. Wikipedia. https://en.wikipedia.org/wiki/Counterfeit_money. Accessed 12 January 2020.

poverty line, below poverty line, income disparity. . . that are very much in vogue in governance. All these show the governance of economic security needs to be reformed and reengineered. Other expressions such as “born with silver spoons or golden spoons”, “prince and the pauper”, etc. have psychonomical connotations in the studies of money. They also dissonate; hence demands caution in usage lest decisions should turn awry.

The economic pyramid is an imaginary palace of wealth where one stands based on his or her wealth. The positions can change continuously. People climb up and down in the economic pyramid. A government should be alert and all the time in absolute control of the economic pyramid to ensure the flow of money in the system. The disparities can make the pyramid elongated or flattened. It depends on governing economic security. Inside the economic pyramid, ideally one can supersede the other, but realistically, it is not an easy task. The reason is not that one cannot make more money than the one ahead and then go past parallel along the lane. The problem is the mystery behind economic distancing. It is not clearly understood. The author believes there should be some purpose behind the reality of economic distancing. If so, it should be natural and, therefore, will remain whatever a government may attempt in equitable governance. Providing economic equity or bringing financial equality can be impossible under the law that governs economic distancing for basic economic security in relation to human activities. Governments and ideological systems in governance may talk about equity principle but will not be able to establish it. The government needs to ensure the money flows within the system at the desired velocity. This argument, if true, will make some of the sustainable development goals null and void being impractical. Zero tolerance to poverty is practical, but is zero poverty attainable? Poverty is not only a stasis but also a comparative sensation. Poverty in affluence could be natural under the law of economics. No -ism or financial jugglery or buffoonery will be able to turn economic disparity into equitable economics. Equitable economics makes the velocity constant. The power, rather the force, of economics lies in the disparity. Without disparity, the economic gradient that is necessary for the flow of money cannot be established. A government needs to drive economy at the right speed without stopping even for a leak.

The question of haves and have-nots in any economic setup does not have to be unduly unsettling in economic security governance. Haves are necessary to have the have-nots and vice versa. It is the money flow control that matters more. In a stagnant situation, they will be notably conspicuous. In other words, for the haves to exist there should be have-nots and vice versa. This is a hypothesis difficult to prove even if true. Perception of people in different strata comes in different shades. Economic security covers the entire spectrum of financial colours. The globalised economic age that the world is looking forward can be more at peace than the world that has been before. Economic security is based on free trade and looking at global economy as an open system. It is against a closed system of economy where there cannot be long-term growth. It will be controlled by decay and disorder ultimately. The larger the area, the better the flow. The continuity of flow at optimum velocity matters. The governments should know it and keep it regulated.

The role of government in economic security is finding a way to NS_{max} by capitalising the economic security concept, which is the basic need for the people. However, economics can turn even the most rational to irrational. Simple assurance may not be sufficient, even a rap on the knuckle by policies, regulations, rules and taxation will be necessary to steer people towards economic security. However, the rules should not constrain the flow of money within the system. A case in point is from Pakistan. The Supreme Court of Pakistan banned extravagant feasts in wedding ceremonies. A wedding ceremony that may last up to 5 days of sheer spending in feasting under pure psychonomic conditions in Pakistan can put families into debt for the rest of their lives. The Supreme Court order may have saved many such families to keep their dignity as well as their spending under control.⁵³ However, the problem is if strictly enforced, the money of those who could spent will get stagnated and reduce the flow into the system. Collaterally, the cut on expenditure closes sluice gate of money assuming everyone can spend. A look at the wedding scene in India during COVID will throw some light. Many families could avoid generous wedding under COVID etiquette; the social system lost that much money flow into the palms of many who would have needed it. There is a systemic economic imbalance in such situations. Never block the money flow lest it should cause a clot in the money trails of the system.

There is a problem that many countries face in money management. Most of them call it parallel economy. It is more parasite economy. It exists within. It threatens to destabilise the organised economy.⁵⁴ Parasite money is illegal. The government needs to have a clear estimate of the illegal money in circulation if economic security has to be stabilised for optimisation with other elements. Economic intelligence is important for controlling it. There are other astute methods also that a government can attempt. Situation becomes worse when illegitimate money leaks into legitimate money.

The velocity of money will depend upon the shape of the economic pyramid. If the pyramid is taller, then more downward flow is expected, and in a flattened pyramid, the flow will be more horizontal. Velocity of money will be an interesting study that is not elaborated here. Each nation will have their differing economic pyramids. Besides, the pyramids within will also change shape depending on the economic security of the nation which will be time functional. The economic pyramid makes the economic system dynamic; hence economic level differences are not only natural but also supportive to national security management as it also enters the realm of perceived security. The shape of the pyramids will change as a function of time in the life of the nation. The role of the government in economic security is to optimise the shape for the best feasible monetary velocity within the system and also countering the money circulation in unwelcome colours. A uniform velocity should make all in the system equitably comfortable in well-being, though not equally amorous in monetary indulgence.

10.17.1 Definition: Economic Security

Against the background of this study, economic security means the capability of a nation to economically advance itself and remain in continued solvency by governance to provide for the maximum equitable and equal quality life to its people without being economically dominated by other nations and entities, in a sustainable manner, perfectly aligned with the other elements of national security and integrated with all the terrains of national governance.

10.18 Summation

Economic security is not about economics or finance, but about national security. It is an element of national security that has to work in tandem inclusively with other elements. It has to be executed by the government through governance. The objective of economic security is eliminating economic insecurity in a human system. For a nation, it means wealth generation and distribution for sustainable well-being. However, there are differences between money and wealth (Box 10.4).

Box 10.4 Money and Wealth

Money and wealth are not identical, but it helps to understand each other. A government has to care for both in economic security. Money flows between human entities as a medium to meet the needs and wants and, thereby, generate wealth. Wealth is a sustainable value inherent to well-being. Money and wealth are mutually dependent but characteristically different at the same time.

The government needs funds to meet public demands and other requirements of governance without falling into unconstructive debts and deficits. In this case, a nation is not different from an individual on financial and economic needs. The government should be able to govern the nation leveraging on economic sufficiency which in turn is maintaining economic security. The objective of economic security is to make a nation economically strong and sufficient. It is linked with the global economy. It demands competitive efforts in the global market on one side and effective inward approaches on the other to manage citizen's requirements internal to the nation.

The economic issues a nation faces may include retarded growth, higher manufacturing costs, unemployment, deficits, inflation, depression, panic, etc. The objective is to make the economy stable and growing. The government will have to adopt appropriate macroeconomic strategies to balance inflation, price levels, national growth, national income, GDP, employment, surpluses and reserves for levelling deficits and shortcomings through professional budgeting and expenditure management. Similarly, the microeconomic issues of the people and organisations

including industries have to be cared for. While in the former, importance is given to the structure and performance of the entire economy, the latter matters more on the psychonomical factors of individuals and groups. In that context, psychonomics is a term used in this study to draw the attention of behavioural aspects of individuals and groups in matters related to money and finance. This behaviour is also conditioned by belief systems. Psychonomics also affects governmental decisions in budgeting and expenditure. Governments may spend the money based on psychonomical motives of the individual ideologies the people in governments practice. That will reflect in the financial system management. This will show in both the macro and microeconomic policies and decisions.

The conditions of economic security depend entirely on the people and their governments based on their ideologies and belief systems and the metrics they employ to assess the well-being and quality of life. It can be different in different human systems separated by ideologies between and within the nations. The governments should be aware and align the differences for standardising governance. Whatever may be the condition, the common factor is the velocity of flow of legitimate money within the system well-regulated as required to prevent overflow, stagnancy and desiccation that can constrain governments in regulating the flow of money within the system.

Unnecessary indulgence in economic escapades including economic warfare can turn detrimental and counterproductive for governments in the global context. This is a considered outlook of this study. The impact of economic adventurism aimed at other countries with objectives of subjugating them did not find much yield in the past. There are many limitations to various economic theories, ideologies and belief systems. The reason for them is that they are not tested on the ground for their effectiveness under varying conditions and human behaviour before application. The real-habitat details of the human systems are missing while theorising concepts. Governments will have to intervene under practical and realistic conditions. The reality can be quite complex in governance interventions. Often governments underestimate this aspect while budgeting and spending. Research in psychonomics may lead to valid findings germane to the particular human systems. Presently, there are many economic indicators that can still outdo the deficiencies within the economic theories. They could be modified to support and fine-tune governance towards optimised economic security appropriate to the particular nation and compatible with the global economy. In other words, the economic theory followed by a government or the human system in governance should be compatible with its system ideology on finance and economics. Common areas for any government to appreciate in economic security governance are long-term economic growth and increasing national and individual income under regulated velocity of money in the social system for considered human well-being.

This chapter does not define good economics but considers better economics is where the government ensures the velocity of flow is always at the desirable level, where desirable level is as decided by the government for optimising economic security with other elements of national security without permitting stagnation or over-accumulation at any point. The choice in front of governments can vary.

Chapter 11

#3 Resource Security (Resourcesec) (r_s)

Principal threat to resource security comes from humans who benefit by it

11.1 Introduction

If conflicts are natural to human systems and resources are the prime cause for conflicts, then, perhaps, the first ever war fought by humans could have been for an extremely valuable resource of the period—fire. There would have been nothing more valuable than fire (the shored-up energy) (Box 11.1) for the prehistoric humans along with air, water, food and refuge. They are perhaps the ultimate resources—resource5 or the R5 (Box 11.2). They would have taken air and water for granted as perpetual in the beginning. They scavenged or gathered food. In the process they moved around, sometimes never returning to the starting point after days of search through unknown domains. Human migrations in the early days were in search of resources or away from their resources taken by the more powerful which were not in closed-loop journeys. They made shelters wherever they felt using various locally available resources. This made them move further if they could not resist the invasion under force from similar looking but more powerful *Homo sapiens*. But fire, the shored-up energy, was different. It was more of a conflict resource of the primitive. The intricate demands for air, water, food, refuge and shored-up energy put the human system in a kind of survival imbroglio in the very early moments of human life. This was what the human system was made of resourcefully and miserably. The miserable state, irrespective of wealth and other holdings, still continues and will remain forever. Within this situation resource security is a kind of palliative assurance of life's sustainability. It is an element of national security that makes the governments run for survival—whether it is for onion or tantalum.

Box 11.1 Fire: The First Shore-Up Energy and Conflict Resource

The credit for inventing fire perhaps goes to *Homo erectus*, the first recognisable members of the *Homo* genus believed to have lived between 1.89 million and 110,000 years ago¹ in certain parts of Africa and Asia. *Homo erectus* lived for the longest time compared to other human species, very long time back.

Box 11.2 Ultimate Resources for a “Not So Bad”² Life: R5

Air, water, food, refuge and shore-up energy...that's all, in that order for survival. The author calls them R5, the resource *Panchabhoothas* for life or *jivasadhansampathi*³. In fact resource security for a government revolves

²Under the “life is ugly and unpleasant”, but humans have to make it better by their intellect principle.

³Meaning resources in Sanskrit.

Box 11.1 (continued)

around them. In other words they are the “human resources”⁴ that need the prime focus of a government.

The study of resources runs through the study of humans, because humans use resources. Humans are not resources by themselves in any human activity. A look at human origins is like walking through a blind tunnel of irreversible time. The problem in a tunnel is that the light will be only at the end, that too for optimists. Pessimists may not see it. That is why they are pessimists. Of course, pessimists won't sit tight or lounge like optimists. They will do something out of fear and anxiety. But in a no-holds-barred situation, anybody will have to walk through blind tunnels with the confidence that even though dark inside, the dimensions of the tunnel are restricted except over the length. It is like crawling through a geometrically shaped pipe or a vent. They have limiting sides. Therefore the study of chronological unknowns is only constrained by the length of time, but not immediate spatial dimensions on other directions which is not influenced by research momentum. This is one of the ways historians and crime investigators may proceed into the tunnel of time—ahead in the chosen direction, either into time that is passed through or towards that is yet to come. The period of passage is not expansive to get lost as if in an ocean, but a tunnel that is long and seemingly endless in the direction of investigation. The author's favourite term is “worm tunnel” of time. One can work in the “dark” within the dimensions of such configurations knowing the unknowns are only in the direction one is moving, not in other directions. Hence accessing and utilising knowledge could resolve issues. Patience is the principle of the game in the tunnel of human time, not conclusion because the process will be ongoing more or less indefinitely.

In this catch one may find that *Homo erectus* was not the first “homo”. He or she probably was the second among the species that anthropologists consider “the great ape” evolved to the point of homo—*Homo habilis* that lived 2 million to 1.5 million years ago in sub-Saharan Africa. Both used resources. *Homo habilis* made tools for daily use to cut, shape and crack. In this calculation there is an overlap of 0.39 million years by *Homo erectus* into the *Homo habilis* period. This overlap is important for anthropologists as the chances of differential mating between two species that almost look alike for those involved and associated gene transfer and mutations were possible. It is not possible in evolution to have a strict line boundary

⁴The author does not consider the term human resource is appropriate usage to explain about employees or workers as they use resources for getting the work done. These resources can be said as human resources. The term is also not grammatically correct as it invokes semantic dissonance in serious studies. Therefore human resources are the five instant elements explained here: air, water, food, refuge and shore-up energy as believed from the earliest days. Today resources are spread out in all forms based on needs and wants. Also see Paleri, P. (2018). *Human investment management: raise the level by capitalising human*. Springer Nature Singapore Pte Ltd.

for one species to go and other to enter like boarding a flight. Things go simultaneously in life changes. That is the crux of life and what the humans take as the oddities of behaviour.

Homo habilis was said to follow the not-so-fully-erect *Australopithecus* before them. *Homo erectus* followed them. The credit for inventing fire goes to *Homo erectus* though the *Homo habilis* would have discovered it being born earlier. This is as of now.

The way fire entered the list of resources as an inventory aeon before matchsticks and lighters were invented is also a matter of conjecture of ancient life. The exactness could be amiss in perception. But the use value of fire ab initio could be a better deduction—protection from predators, providing warmth, finding ways in the dark, cooking, tempering stone tools, etc. The ancient people needed it badly for all those urgent needs. The intellect has to work and simultaneously grow. Initially it would have been gathering fire by the daring in the group from the burning wild. Perhaps the strong also would have snatched fire from the weak and preserved. Some would have burnt their fingers. Others probably ran in frenzy, clutching the fire they snatched, dodging the opponents and sometimes selling dummies to them as if in football. The scene is repeated in American football today with the oblong ball in hand. (If it is oblong, can it be a ball?) Well, that has nothing to do with the law of invariance.

When the fire went off, they, the primordials, became depressed and waited long for another lightening to strike a tree or the grass over the land. They would have looked at the sky for fire, until they learnt to make it themselves. Life changed seriously as if in an intellectual windfall for the first time along the route that humans were meant to go for survival. That was when they took the first substantial step in life's progressive equation that was to remain for a very long time until the second intellectual stage—farming and domestication. These statements cannot be proven in the absence of direct evidence. But certainly, similar scenes can be witnessed in the new age biomodels when resources are distributed to people hit hard by calamities—in disaster scenarios, refugee hamlets, water supply points, locked-down habitats and so on. This is here the law of invariance comes in handy for a reverse look into time.

Resource hunting was one of the main agendas of collective sapiens and their earlier species. The Trojan War (Chap. 9), it was said, may have been fought in part over tin, the critical resource of the Bronze Age along with copper.⁵ The purpose of colonisation was resource gathering and trade. Scarcity of resources and the trade requirements coupled with the human urge to be in motion drove people across the land and the seas to distant lands very early in human historical time. The strong and adventurous charted their passages and courses to resource-rich countries to trade, plunder and colonise. In the modern-day resource colonisation, dominant nations strategically control the resource-rich but otherwise deprived countries. Scarcity can result in conflicts leading nations to assume rival positions creating environmental

⁵Romm, J.J. (1993). *Defining national security—nonmilitary aspects*. Council of Foreign Relations Press. p. 21.

refugees. Resource requirements also became the cause of crime and conflicts. There is no end to it. Within this complex scenario remains the inquisitive case of resource security, the third element of national security.

11.2 Resource Security: Setting

Resource is a general term employed in different contexts in management and governance. At the bottom of usage, resource refers to what the user has perceived as a support requirement for an activity. In national security, at the high end, a resource is a support inventory for sustaining life of the people in the best possible way at maximum well-being.⁶ The term does not represent resources from the point of view of an individual's personal life, but that of a group—the citizens of a country. Nature and quantum of resource change when quality of life changes.

Every human system is resource dependent. It is important to mention that, in this study, human beings are not considered resources, though human resource development is a key discipline in management for quite some time. But in reality, humans apply and consume resources. Relatively, a resource is what is required for a particular system—the means or assets that form the source of support or help. The earth's capital comprises a number of life support systems as resources for human use. Most of them are vital for human existence.

Resources are renewable or non-renewable. Together, they shape the resource environment that sustains human systems. The resource environment initially was the immediate surroundings of the humans. They expanded gradually depending on the mobility of the people. Today, the resource environment covers the entire planet. Humans cannot get them beyond the accessible limit, which also means exploitable limit, even within the planet. The resource environment could expand into outer space in the distant future as human reach and technological supports extend.

It is understandable that depletion of essential resources can undermine human lives. Sustainable development and continuity require balanced consumption of resources. Otherwise the future generations will bear the brunt of overconsumption by the past and present generation. The world is alert on this aspect. That is the reason for Agenda 2030⁷ of the global community on sustainability issues. Holding on and regenerating resources, therefore, are vital for governments to see in national and global governance.

Running down of resources can cause the entire technological society to collapse. Therefore resources need to be managed by the government in a sustainable manner

⁶Resources are identified differently by many. For example, in general terms, resources are human capital, money, assets, knowledge, mental and physical capabilities, security, materials, etc. In the concept of national security, the idea is different. Resources are what are seen as required physically for human survival—water, air, metals and minerals, etc. More explained in the chapter.

⁷The Agenda 2030 comprises the 17 Sustainable Development Goals (SDG), and it has 169 targets adopted in 2015 by all countries of the United Nations for a period of 15 years ending in 2030.

with zero depletion at the future rate. This is an interesting mathematical maxim. Targeting zero depletion in resource security does not mean retaining the “stock” as it is now by refilling it as and when consumed to the initial level by regeneration or alternation. It means keeping resource balance according to future demand in spite of present consumption. It also means renewing resources by regeneration or alternation at future rate. Future in resource security means from the very next moment to eternity, where eternity means the period humans will survive on earth. It is going to be a very long time.

In this troubled journey, governments will have to exercise caution in resource consumption. The target is zero depletion. The governments will have to find ways to meet the target. The traditional methods or those that will immediately come to the mind are optimising and renewing resources and replacing non-renewable resources with alternate resources. It is easy to say. There are various doomsday predictions. Notwithstanding, in the study of national security, it can be stated conveniently that the very purpose of resource security is to maximise the benefits of resources to human beings without allowing for resource scarcity at any particular time. Resource will be available in one form or another. What matters is optimisation of resources and ensuring their sustenance as part of resource security. Resource depletion is seen from the angle of limitations to growth. It does not take the potential of technology in changing the situation. More than technology, it is the need and the drive to develop the resource that cannot be curtailed for establishing sustainable growth. Identifying the factors that affect resources and countering them by research and good governance will be a parallel activity for resource sustenance. Resource security is aimed at all these factors.

Resource security governance is about making resources available by a government. It is not an easy task. Similar to other elements, it is also intertwined with other elements of national security in a mutually inclusive system. One way that is good news is because resource can be governed by integrating and aligning resource security governance with other elements too. But then, what are the resources which governments should be concerned about? That comes in the detailed analysis and periodic updating of the element of resource security.

Resource is a “thing” one looks for to make a thing that is needed or wanted. Generally, it is mentioned as materials, money, people⁸, time and any other assets that go into an individual or organisational activity or national governance as a productive part of the desired outcome. Further it is said as a source of supply, support or aid. Does it stop there? No. At the macro level of national security, resource is the collective wealth of a nation or its means of generating wealth by productive use. The term has been widely described and used as a term of convenience in strategic expressions, diplomatic conversations, management pronouncements and overall policies of national governance. The term, therefore, has situational relationship and therefore needs to modify the usage accordingly.

⁸It is reiterated here that the author’s contention is that people are not resources but those who look for resources for utility product outcome.

Resource is critical to national security and associated governance. It is the third element of national security associated with the beginning. In this context, resource is primarily the material that also has a cost value besides use value, sometimes so high that may lead to conflicts of dissimilar kinds. Resource security as an element, therefore, focuses primarily on the material inventory that is required and accessible to a nation.

National resources are governed by the government. National resources are normally those within the national boundaries and acquired from elsewhere for public good. The national resources belong to the people of the nation as national commons. National resources are distributed within the legal boundaries of the nation over the land and the ocean. The legal resource domain of the nation in the ocean is as specified and accepted by the law of the sea⁹ in the exclusive economic zone (EEZ)¹⁰. The resources in the resource environment of a nation include the forests, metals, minerals, oils, rocks, wildlife, land, water, air and atmospheric resources, underground resources and anything else as specified within the sovereign political borders of the nation, the EEZ and legally beyond as in legal continental shelf and deep seabed. At this juncture it will be interesting to briefly examine the idea of commons: national and global.

11.2.1 Commons: National and Global

Ideally, the resources of the world belong to all, but they are limited under the sovereign divisions of nation states. The national resources similarly belong to the people of the country. They are the national commons. There too are divisions. The governments can see this aspect for equitable allocation and distribution to the people. The governments can also examine the ways to exploit the global commons for the benefit of its people in accordance with the international law. Global commons refers to common or sometimes called common-pool resources in the international, supranational and global resource domains. They are resources that legally belong to all the people of the world. Global commons include the earth's shared natural resources, such as the land over Atlantic, high ocean (the part of the ocean that doesn't belong to any country for exclusive exploitation), the atmosphere and outer space.

⁹Based on the United Nations Law of the Sea Convention, 1982 (UNCLOS) also called the Law of the Sea Convention or the Law of the Sea Treaty. It is the international agreement resulted from the third United Nations Conference on the Law of the Sea (UNCLOS III), which took place between 1973 and 1982. The agreement was signed on 10 December 1982.

¹⁰The exclusive economic zone extends 200 nautical miles into the sea from the baseline along the shore or as accepted but not exceeding 200 nautical miles in which the territorial waters comprising 12 nautical miles or as accepted but not exceeding 12 nautical miles is the territorial sea into which the sovereign rights of the state extends.

The resource security of a nation covers these aspects. In whatsoever way the governments may function, the approach to resource security governance of a nation should be focused critically over the global commons leading to national commons. Presently there is no codified international law on global commons. But the exploitation, usage and other matters of governance can be arrived at through various laws and resolutions. In the early centuries, land provided almost all resources. It has changed since the time the humans turned to the oceans. Economic exploitation of ocean resources can be hampered by technology limitations. The economic exploitation of ocean is not limited to resources alone. There are various other activities to maximise the benefits from ocean which can be summed up in one term—ocean property¹¹.

Besides fisheries, a typical food resource of high nutritional and economic value, various other resources are also available in the ocean including oil and minerals. Resource security is not about food resources alone, but all that support human life systems in the world. Resource security, as an element of national security, has to be optimised for human sustenance and well-being.

11.2.2 Classification of Resources

There are different ways of classifying resources. One of them is situational approach. In this approach they are classified as non-renewables and renewables based on their permanence by regeneration. It is on the basis of continuous use. The non-renewable will finish by usage. Renewable has a chance of regenerating if sustaining conditions prolong. Straight-line management and governance under this context is “do not finish off the non-renewable (like the toothpaste in the terminally buckled tube during a long jaunt in the wilderness)”¹² and sustain regenerative conditions to keep the renewable going.” This seemingly simple and “anybody can do it” type of solutions is extremely complex under human system behaviour. That, perhaps, is not the solution in mathematical terms. The non-renewables one sees around may not be meant for survival use. They are not labelled that way, of in a course, in a human language. The label on them is the factual proof that they do not come back once finished. So ideally humans should refrain from using them. Look at the toothpaste mode (above), and watch the way one spends money which is a situational non-renewable even for the richest hoarder of it. Use only renewables

¹¹ Ocean property means the single factor with its elements that if maximised can support governance in the maritime domain of the respective country's ocean terrain for integrating with the overall national security maximisation process. The elements of ocean property are ocean resources, ocean advantage, ocean environment and oceanic islands for a nation (not explained further). Paleri, P. (2007). *Role of the coast guard in the maritime security of India*. 2nd ed. Knowledge World. Pp. 109-13. Also see Paleri, P. (2014). *Integrated maritime security: governing the ghost protocol*. Vij books (India) Pvt. Ltd.

¹² The metaphor here is even the seemingly renewable can become situationally non-renewable.

maintaining sustainability conditions for regeneration. Is it possible? No, because human wants are driven by perceived security. The government gets into a kind of resource dilemma in both cases. The choice for effective governance is to optimise resource security. The success in governance depends on it. This situation induces a kind of resource dilemma in the governments. Resources can also be classified as living (biotic) or non-living (abiotic) based on their existential characteristics. Another way is in terms of mutability, quantity and reusability (recyclability). They can also be seen based on their availability as inexhaustible and exhaustible resources. This has to be taken with caution to avoid semantic dissonance. There is nothing inexhaustible under the theory of entropy¹³. Everything has to transform. Besides resource is a “thing” for the humans. Otherwise in nature and universal application, it is another entity subject to transformation under irreversible entropy, similar to any other entity including human. Resource is a perceptual term of convenience within this transformation based on the use value of an entity to humans for their existential survival. Classification under maintainable and non-maintainable resources will also fall within these categories. Classification of resources does not affect the way resource security is viewed. It is a question of demand and supply and balancing them with sustainability that in turn governs availability. Each resource has a separate identity. Collective identity by classification is only for appropriateness. Strategic management of resources has to be done under this principle—item specific, not class or type specific weighing the use value against opportunity outlay.

Classification of objectives given under various heads in the preceding paragraphs is primarily meant to explain resource management is purpose oriented. From individuals to the nation to the global community, resources are essential at every moment in human life. The classification of resources will accordingly get prescribed based on needs and wants. Resource security, however, does not fall under the use value of any productive activity but the overall governance motion of a government to maximise national security. Resource security refers to the resources in governance. They are the resources a nation possesses by natural control or external acquisition. They are normally taken as non-renewable and renewable. There are no hard and fast rules to segregate them in this manner. Classification is the prerogative of the government based on its style and need of governance. In the national context, resources also acquire names based on “how hard to get them”. An example is the much-spoken conflict minerals which is a subject that interacts with the element of geostrategic security. Conflict minerals are a legal term under the US legislation¹⁴. In general terms, conflict minerals are minerals sourced from conflict-

¹³ Meaning the theoretical aspect of system entropy (under the second law of thermodynamics), the measure of the unavailable energy (disorder) in a thermal system when the sink temperature is kept constant and not the “information entropy” in communication theory introduced by Claude Shannon (1916-2001) in 1948.

¹⁴ Section 1502 of US Dodd Frank Act. The Dodd-Frank Wall Street Reform and Consumer Protection Act, 2010, regulates a number of US systems related to consumer protection, trading restrictions, credit ratings, regulation of financial products, corporate governance and disclosure and

affected locations and which directly contribute to ongoing violence and forced labour in such regions. The minerals classified as conflict minerals are columbite-tantalite (the ore from which tantalum is extracted), cassiterite (the ore from which tin is extracted), wolframite (the ore from which tungsten is extracted) and gold (2016). All these minerals and metals have been conflict minerals *ab initio*. Remember Trojan War? Yes, Agamemnon went for cassiterite, not Helen. Cassiterite is still causing conflicts. They are also considered strategic minerals. Although they are mined in many conflict-affected regions around the world, existing regulations today (2020) primarily focus on the Democratic Republic of the Congo (DRC) and its adjoining countries.

Resources, starting with fire, caused innumerable conflicts throughout human history. It is expected to continue in spite of global awareness in sustainability and brewing aversion for war. Land itself is a resource. Hence border disputes too can mature into conflicts. Presently the only counterforce that is holding full-blown global conflicts are responsible governments, international organisations and the providential human virtues. The absence of a global resource administration is largely felt. The present systems are resource specific and not collective to address the resource security issues. Therefore the national governments have additional responsibilities of administering and governing resource issues with modern methods and novel ideas. The influence of politics and culture including religion has a lot to do with resource management in the global scenario.

11.2.3 Politics, Culture and Resources

Control of a nation on its own resources and also on its demand from elsewhere is directly related to its geostrategic security position since resources are subjected to intervention from stakeholders beyond the borders of a nation. Utilisation of the world's natural resources has depended, to a large extent, not only on the development of technology but also on socio-cultural and political circumstances. Nations under colonisation could never develop their own natural resources independently and without reference to the economic interest of a colonial power. Another factor that affected utilisation of resources was cultural attitudes. Cattle, for example, are resources controlled under cultural restrictions in certain countries. Such resources are always seen from the angle of replacement. The replacement resource becomes the equivalent resource in such case. There could be other reasons too for replacement of resources.

transparency. Section 1502 of the Dodd-Frank Wall Street Reform and Consumer Protection Act requires public companies in the United States to disclose their use of tin, tungsten, tantalum and gold (3TGs) in their products and determine if they are sourced in an ethical manner. It was passed to prevent armed groups in the Democratic Republic of the Congo (DRC) and surrounding regions from benefiting from the sale of these minerals.

A scholar friend from Japan had once told that while whale meat was considered a delicacy in Japan, the people got into the habit because the much-desired beef was expensive. The whale meat thus became a replacement food resource for beef and increased its value by sheer substitution if it was true. History also speaks about how people live under resource crunch, especially in relation to food. They look for replacement sources for resource.

The immigrants to the promised country of America found killing the wild buffaloes, termed bison, on the west was an effective way of upsetting the life of the natives in the area.¹⁵ The American West was generally untouched by the immigrants in the early days of migration. It was a place of native Indians, gold and wild bisons. The bisons roamed the American West from Mexico to Canada. The plenteous bison was a renewable resource for the natives not only for food but also for other physiological needs of refuge and clothes and the psychological need of faith and worship.¹⁶ They were the all-in-one resource for the sustainability of the native Lakota Sioux tribe, fiendish and powerful, settled there around 1765. Destroying them meant clearing the Wild West. Ultimately that was to happen. The bison of the American West thus became a conflict resource very early in the days of the new world.¹⁷ What the migrants to the new world have done was resource denial to the natives. It worked.

There are countries where people had forced themselves to dine on rats when everything failed. At the same time, there are people who may find a well-barbecued rat a culinary delight at a roadside delicatessen. In gastronomic matters habits govern food resources at the top of it all. Habits change according to situation demand. The value of a resource is governed by technology. Improved technology can increase the yield of food resources. Technology also may make it possible to exploit mineral wealth that was previously inaccessible or not economical to exploit under limitations.

Resources contained and proscribed by politics and culture can become potential conflict gatherers. Governments should take special note of such situations to resolve potential conflict scenarios. Methods of dispute resolutions under intercultural contexts need to be identified. Resource conflicts are neither a thing of the past nor may end up as wars between nations. They have the potential to go uneasy in the geostrategic context as well as domestic scenarios internal to a country between different regions. Resource conflicts will continue more vehemently than short-term limited wars between two countries.

Sensitive and exceptional ecosystems of the world such as arctic tundra, tropical rain forests, coastal zones, wetlands, islands and semi-arid rangelands are under

¹⁵ American military commanders ordered troops to kill wild buffalos to deny Native Americans an important source of food. In 1905, zoologist William Temple Hornaday (1854–1937) (William Hornaday) formed the American Bison Society to re-create more wild herds.

¹⁶“The buffalo war”. <https://www.pbs.org/buffalowar/buffalo.html>. Accessed 23 April 2020.

¹⁷There were also arguments that the bisons were killed to prevent the spread of brucellosis disease that infected them.

continued pressure for development worldwide. Many of them are centuries-old habitats of a variety of indigenous peoples. Environmental habitat protection along with the resource inventory of these places can best be achieved by developing true partnerships with local populations and sincerity of purpose in governance rather than profit and short-term initiatives. The balance between maintaining environmental health and providing for a growing world economy will require resolution of the inevitable conflicts over conflicting cultural values. Resource security in this way is closely linked with the elements of ethnic security and environmental security. The Westphalian system is still the proscribed model of a nation. But there are variations. The largely held precept that one should not interfere in another's internal affairs is slowly getting breached under the causes of conflict scenarios that may leech into another's internal domain. This is making the international community voice against issues that may impact globally achievable serenity. The word peace is avoided here to stick to the arguments in this study about peace.

The cultural identity of human systems is closely associated with the natural resources. Every living thing instinctively protects its territory. Whether it is a dragonfly or a sapien colleague in the tiny partitioned office cabin, the territory is precious to both. Sometimes the dragonfly may possess a larger area in the sunny garden than the colleague in a room without a view. But the relationship with the territory of the moment will be obviously visible. The indigenous peoples show it much more seriously. They may kill an intruder. This is important in handling conflict resolutions related to politics, culture and resources. It is an extremely sensitive area. The term sustainability holds the key under such circumstances.

11.2.4 Resource Security and Threat Attraction

Resources are high-degree threat attractors. That means they are targets ab initio they become "resource" for humans. Sustainability of resources depends on the threat to which they are exposed. Consequences of the threats can vary from resource depletion to resource colonisation to war. Threat is not from people alone. Natural-renewable resources are exposed to larger threats than others. Often the cause is secondary. Oxygen will be depleted if photosynthesis is not taking place. It may come as a surprise to many that there is already oxygen depletion in many parts of the oceans around the world. Methods of improving the oxygen content of the oceans have been examined seriously. Fresh water will be scarce if the water cycle is affected. It can happen by climate change, which again is attributable to different causes. The threat to natural-renewable resources is always in the form of a domino effect that at different stages will metamorphose into diverse types of threats. Biological products are replenished through natural cycles of reproduction and growth, which in turn depend on other natural-renewable resources.

Resource required to create resources, both natural and produced, is a major threat attractor if the product consumes them heavily. While it may not have been understood, many produced resources consume heavy dose of other resources, especially

natural-renewable resources. The hidden threat associated with such multiple uses of resources is to be seen very clearly in resource security element of a country. Resources also can be wasted by callous attitude in resource management. The water cycle, for example, in a country will not only be ineffective but also damaging if the entire rainwater runs back to the sea carrying the topsoil along with it. A rainwater-harvesting scheme may be of multiple advantages. It can be seen from this examination that environmental security is very closely related to resource security and any change in it will have an impact on resource security that in turn may affect other elements of national security. A bad monsoon can shoot up inflation in a monsoon-dependent country. Preventing this chain reaction is the primary objective of resource security management. The question is not the classification of a resource, but availability of it in a sustainable manner to meet the demand.

Overuse of resources is another threat. Often it is indirect. It is not done with the intention to deplete the resources. Mostly it happens to common-share resources. Such resources are naturally born and not owned by anybody in a nation. Almost all such resources are renewable. They are also included in the global commons. An example is marine fisheries resources. If resource utilisation exceeds its natural replacement rate, the supply will reduce, and sustainability by reproduction will be hindered. There are also non-renewable resources that can be recycled. That is a potential capability to keep the resource in circulation in the same or different form. Recycling is a process by which non-renewable-recyclable resource is kept in demand. However, the cost of recycling is to be compared with the benefit in such process besides other aspects like environmental effects, etc. Normally non-renewable resources can be used up completely. Most of such resources, like fossil fuel, are accumulated after millions of years of biological history. Alternative resources to replace such resources, and waste control to increase the time span of resource consumption, etc., are suggested remedies.

In an ideal situation, a renewable resource should last forever. But it is not so if its renewability is threatened. The threat to such resources is not direct, but indirect and covert. This does happen and can counter only by conservation measures that will offset damage. Conservation is a direct and overt protection to counter an indirect-covert threat. Conservation is calculated based on the maximum sustained yield. It is the maximum rate at which a renewable resource can be consumed without affecting its renewability. The yield may vary for resources and also as a function of time in certain cases. This yield has to be protected by controlling demand or increasing the maximum sustained yield point. The latter is more difficult. Conservation of resources is a very complicated matter that needs careful methods and focused attention. Extinction of plant and animal lives is when the consumption or destruction exceeds the maximum sustained yield. Threats to maximum sustained yield of a resource are many: overexploitation, collateral damages in the use of resources, increase in economic demand, increased demand by need, lack of awareness, disaster situations, environmental damage and others. They can be brought within the ambit of the threat matrix cube and analysed for effective countermeasures. Resource issues can threaten international security. Will there be conflicts at the global level for the control of resources? If so, will it be in specific cases as is already

seen in the case of oil? Oil is also associated with energy security. Hence the relative connectivity of resource security with energy security is the linkage that needs examination in the management of resource security. Sufficient supply of primary resources is expected all over the world. Besides their availability, the regulatory regimes and international trade movements ensure this and avoid conflicts. Besides, conflicts can be counterproductive in resource security management. In the early days, control over territory was considered to be the biggest threat to resource-rich countries from powerful military countries. Military control ensured resource supplies. In the modern world, the apprehension is that resource scarcity will make countries to pit against each other.¹⁸ This may be pre-empted by global market forces in today's international environment. The threat analysis leads to the fact that resource security can be affected by many interactive and intricate possibilities:

- (a) Demographic density
- (b) Overexploitation
- (c) Unregulated usage
- (d) Waste
- (e) Environmental damage
- (f) Climate change
- (g) Capital-intensive exploration
- (h) Surging demand by over-industrialisation
- (i) Break in renewability cycle
- (j) Conflicts
- (k) Economic imbalance
- (l) Disasters
- (m) Military campaigns
- (n) Resource scarcity

In any case, key energy and other resource producers will be vulnerable to aggression from powerful military nations. Nations may rob resources from each other. Resource fields where access is limited because of hostilities will be another problem. There could be political differences in usage, and that may lead to wars. Water and oil are prime candidates for conflict area interface problems today. Resource powerful international cartels may force politically powerful nations to change policies. Cooperative security policies can be overlapped with private interests of nations that may attempt independent intervention.

All in all resources under threat cause turbulence in national system governance. Volatility in prices, market concentration, supply bottlenecks and so on because of resources coming under threat can be the lead causes for international tensions and violent confrontations. The disputes caused by resource games should be handled by individual governments and international organisations under limited charter. Undoubtedly as the human system enlarges, there is an increased potential for

¹⁸Institute for National Strategic Studies. (1999), *Strategic assessment*. National Defence University. p. 40.

conflict. It can further disorient countries and regions that otherwise maintain cooperative inter-state relations. When resources come under threat, there will be conflict risks within the producing and consuming countries and in relations between them. Professional governance can overcome such situations and generate new patterns of cooperation. Governments, therefore, should be clear about the circumstances under which resource threats lead to conflicts and how such conflicts can be contained and regulated.

11.3 Critical Resources and Resource Security

Critical resource is a variant term used specific to situations and needs. In some cases it is the resource that if not available can halt the entire process associated with a specific activity. The entire objective can be lost at the loss of the critical resource. The legendary nail in the proverb “for want of a nail” (Box 11.3) was a critical resource pointing out to the domino effect leading to defeat in a war for “want of a resource” critical at the time and occasion.

Box 11.3 For Want of a Nail¹⁹

“For want of a nail the shoe was lost.
For want of a shoe the horse was lost.
For want of a horse the rider was lost.
For want of a rider the message was lost.
For want of a message the battle was lost.
For want of a battle the kingdom was lost.
And all for the want of a horseshoe nail”.

It could also be a resource that can be in use for a process just once. Notwithstanding these statements a critical resource in national governance acquires a dimension of the one that holds the lifeline of the people in sustainable existence. The critical resources hold other resources; they are the resources of resources. They are the resources that a nation should possess at all times including in reserve for national security governance. They are the resources that are the underlying factors of the resource security of that nation which normally are common to all in a general outlook. Resource security is about resources that are important for governing for the well-being of human life, and critical resources are those among them that are critical to optimising a nation’s overall resource security—the raisin on the cookie. Well, not

¹⁹ A proverb carried forward in time for centuries in numerous variations reminding that seemingly unimportant acts or omissions can have grave and unforeseen consequences. Here it is used to remind about the importance of critical resources that may outwardly seem unimportant. https://en.wikipedia.org/wiki/For_Want_of_a_Nail. Accessed 28 November 2017.

exactly. These resources are also reflected critically in other elements of national security. Some of the resources critical to national security and figures commonly in dialogues are land, air, water, food resources, metals and minerals, energy resources and strategic resources. The first four are also prime requirements for all the living things of natural environment. Protection and preservation of these resources will require invoking sustainability governance. It will also have to incorporate the last two critical resources for human development—metals and minerals and strategic resources.

The importance of a critical resource is felt more in its absence. But the exigency is in governing it more than holding it. Critical resources will always remain at the centre of developmental changes. No government can neglect them.

Criticality of a resource is decided based on the demand on it for human existence, the pressures it undergoes, human conflicts associated with it and value appreciation, among others.

11.3.1 Land

Land, terra firma, is a terrain in the macro view of national security. It is the locomotion supporting resource for the dynamic human system. Land is critical for survival. Big and small chunks of land seemingly float in the vast ocean like chocolate chips on unevenly shaped cookies. Humans perch precariously on them to survive without drowning. That is called the land-clasp syndrome.²⁰ It is just a clumsy poetic statement. In reality, land floats carrying the ocean over it on the respective tectonic plates which are part of the crust and lithosphere combine over the molten asthenosphere beneath them. The tectonic plates bang and move relative to adjacent plates like a ship secured alongside a breakwater, among others. It also means the land and the ocean are in constant motion in situ relative to everything on it. There is more to the story of earth. But that is quite deep for national security studies.

The landless person knows the pain and anxiety at the group and individual level. Land is a supporting resource, and its maintainability is of utmost importance for socio-economic development. A country without a land will find it suffocating. An individual without land is always craving for a piece of it in the existential trivia.²¹

Some governments think the biggest issue in land assignment is per capita land availability. It may not be so because there are many nations where per capita land

²⁰Paleri, P. (2014). *Integrated maritime security: governing the ghost protocol*. Vij books (India) Pvt. Ltd. p. 3.

²¹This trivia is satirically depicted in Woody Allen's famous comedy film, *Love and Death* (1975), a parody on Russian Literature in which his character's (Boris Grushenko) loony father (Zvee Scooler in the movie) was shown holding a strip of sod with uneven grass in his hand in the mental asylum of the period. He refused to sell it to another inmate under the hope to build a guest house on it someday. Land is a forceful commodity of security, both apparent and perceived.

availability is small but still have a higher per capita income or the feeling of economic well-being. The question “how much land a nation needs” originates from here. It will depend upon many issues and behave according to the thinking processes within the government. The criticality of land as a resource is in the existence of the country. The population of the nation should have to optimise national security within the land availability. However, the land issues are also based on type and nature of land. Bad lands are not included by many. National security study doesn’t approve it. Any land is good land under the present scenario. It is likely to hold in the future also subject to the exigency of governance of land as a critical resource. The land has to be arable, resource bearing, environment-friendly and pollution-free, habitable, strategic, population-friendly, disaster-free and free holds from border security aspects. It is a wish list to which more could be added. Land that does not support national security elements or national security maximisation is hostile. Unfortunately, nations have no choice on the land they possess today. They cannot exchange it with another. Manageability also counts. It is a vast issue, but this study so far considers any land is good land and adds to the country’s resource security.

Land degradation is a problem. The land can be lost to the oceans by erosion and sea level rise. Degradation can cause leaching of toxic chemicals into ground water. Leaching of arsenic into the ground water was a serious problem in West Bengal, India, and Bangladesh. Arsenic contamination was also reported in China, Taiwan and the Philippines. Another case of land contamination was mercury poisoning in Minamata, Japan. Toxic pollution can lower soil fertility and moisture content. Land is a resource supporter. Even if damaged from the agricultural aspect of life sustenance, land can still hold valuable minerals and energy resources. This makes the land valuable. Land degradation, therefore, means the decline in its capability to supply resources of value. This decline can come from climatological and other disasters and toxic pollution. The national security approach should be from this direction. Value assessment of the land is necessary for this audit. Sustainability of land is to be seen from its value enhancement as a resource security supporter.

Majority of population lack secure land and property rights. Land is not just a possession for perceived security. It is important for the time of situations such as pandemic to keep isolated. Land rights minimise compounding the vulnerabilities of population living in informality. They are in huge numbers the world over. The separation of land ownership is also prejudiced. More men than women own land. Many children do not have ownership right for the land owned by their families. Land ownership often leads to crimes and conflicts among people that can prolong for a life time. Corrupt practices and promotions can mire the issues of land under socio-econo-cultural forces sometimes promoted by abusive governance.

Land is also critical as a resource for the sustainability of indigenous and marginalised peoples²². Secure collective rights to land are important for them.

²²The term marginalised came up in social lexicon in the 1970s. It is a term used to depict who are considered unimportant for mainstream society. It is a kind of social displacement which is not

Strengthening communal land rights of vulnerable populations does not only respond to basic norms of equality but also has positive outcomes on human capital and development. In addition, it is essential to protect property rights for displaced people and refugees to allow for speedy reconstruction after conflict and sustaining the peace. Regularisation of land rights in informal settlements is key for reducing marginalisation, improving services and improving resilience against pandemics. Land ownership for women and the prospectus for children to own land when they are adults improve their security feelings. But in this process of land allocation to people and other commitments, a nation should not lose sight of open spaces over land which is vital for harmony in a social system under perceived security (Box 11.4).

Box 11.4 Importance of Open Spaces over Land

Open spaces over the land terrain as national commons revitalise the land value and thereby quality of life of the people. The open space can be committed for multiple activities, play grounds, parks, lakes, gardens, recreational spaces, etc., controlled and regulated by local governmental systems. They add to the well-being of the citizens. This is one of the ways of governing perceived security in a supporting mode with respect to land possession. Beaches too serve the purpose of open spaces. Wise and responsible governments understand the importance of open-space national commons. Open space belongs to all people. Citizens can find their personal space there. Open space is a great contributor to spiritual security and rejuvenator to the land-clasp possessiveness of the people as a supporting element of apparent security in the overall national security. Open spaces as commons have been parts of human systems always. Humans need them.

The Intergovernmental Panel on Climate Change (IPCC) considers land as an important critical resource in the effort to limit greenhouse gas emissions.²³ Land has a major role to play in the climate system. Therefore, emissions can be minimised to acceptable levels by effective management of land as a critical resource. This also means optimising resource security is for the overall benefit of the global community with national participation. Land is a resource of resources such as food production and renewable energy.

considered ethical and righteous. But it exists in social strata. It is for the government to make them inclusive to governance.

²³“Land is a Critical Resource, IPCC report says”. https://www.ipcc.ch/2019/08/08/land-is-a-critical-resource_srccl/. Accessed 24 April 2020.

11.3.2 Air

Like land, air is another increasingly critical resource. Air is universal. It is not limited in niches or in fragmented packages. It also means damage to air in one part of the world will be felt in another part where it circulates. Clean air is a pressing issue for almost all countries today. Air performs a variety of roles, besides keeping human lungs active in its function. Air recycles carbon by photosynthesising carbon dioxide and uses it to produce energy. Air maintains the water cycle by transporting water vapour and ice crystals by its motion throughout the atmosphere. Air is a broad blanket for the land masses that protects them from freezing by absorbing heat from the sun's rays. Through a process called the greenhouse effect, carbon dioxide and other greenhouse gases absorb some of the infrared radiation the earth releases as it cools. This heat in the atmosphere causes the earth's surface to warm as well. Air also protects life on earth from various cosmic rays that bombard the planet every moment. This is besides burning of the asteroids and meteorites.

Humans need oxygen, whereas plants breathe carbon dioxide by completing the regenerative cycle of both the components of air. It is calculated that human beings on the average breathe around 22,000 times a day. That is 16 kg of air for a normal person. It is a large consumption of air. Air as a resource exists in varying amounts in the atmosphere up to what the mountaineers call the death zone at about an altitude of 8000 m (26,000 feet) or so. The main components of air are nitrogen (78%) and oxygen (21%). The remaining part comprises minor and trace gases.

Air pollution, depletion of oxygen and ozone infiltration are the major problems associated with air management. Air is a resource as well as a resource supporter. It is also a transporting resource for climatological patterns that sustains the world environment in a balanced manner. Air is the only resource that cannot be strictly divided within national boundaries because of its transporting nature. It has to be seen from the global security concept. Resource security for air has to look at atmospheric stability. Air pollution can cause havoc in climatology that will directly lead to climatological changes. The effect of air pollutants on humans could be life-threatening. Cardiovascular effects of oxygen depletion in human health are impediments to health security. Here the attribute of resource security extends to health security.

There are many concerns about air. The main concern is pollution. Polluted air turns global health in confusion and disorder.

11.3.3 Water

Water is another essential resource for sustaining life on earth. The stress on water can affect the health of the planet and, thereby, all the living things without warning. The impact can range from agriculture to industry and from state of environment to climate change. Fresh water, including that in the humid form, is required for land-

based survival. The sources of water are the oceans, rivers, lakes, ground water, deep subsurface waters, glaciers and permanent snowfields. Only 3% of water is fresh. The rest in the ocean is salty. Ocean water can be converted into fresh water by desalination. The world normally depends upon the water cycle to process the ocean waters into fresh water through precipitation. Besides, many nations do not have access to the oceans. Surface-water resources are already being used to their maximum capacity in various regions of the world. The demand for fresh water is increasing steadily. The trend will continue in the future. This situation has given rise to a growing concern over the availability of adequate water supplies to accommodate the future needs of a society. Water is one of those resources for which there is no substitute.

Among the 3% available fresh water, about 2.997% is locked up in glaciers, ice caps and deep inside the earth according to fair appreciation and studies on the subject.²⁴ It may be an insight to many that the remaining 0.003% is the water on which the entire environment and its living organisms including the humans survive. It is what is available in wells, lakes, rivers, soil moisture, atmospheric humidity, etc. The delicate situation related to water resources, the most important resource for survival, could be understood from this fact. Availability of water is primarily through rainfall. Melting of glaciers may produce water, but that is an indication of global warming—an imminent danger. Water stress is said to be created when per capita availability of fresh water is considered to be below 1700 cubic metres annually.²⁵ Considering variations in rainfall, the water distribution over the world is not uniform. There is perennial shortage of water in certain parts of the world. River runoffs are the main sources of fresh water. Destruction of a river can cause serious blockade in water supply. Rivers are the lifeline of a country with respect to water circulation. River runoff represents the dynamic component of the water resources and transportation of this vital resource by sheer gravity. Water is replenished by seasonal rainfalls. River valleys have been important to centres of civilisation. Death of riverbeds had also caused collateral destruction of human systems that depended on it.

Among rivers, the Amazon in South America is the world's largest source of fresh water with a drainage area of 6.15 million square kilometres. It holds 17% of the world's fresh water. There is water for all on earth if that river is preserved. Killing it will be tragic. The Amazonian surroundings are pristine. It is strictly a flooded forest land. Situation is not healthy in the Amazon. Fishing is the biggest business, and most of the special varieties are on the verge of extinction.²⁶ Interestingly the Amazon is tipped to become a desert under the dangers of climate change. The national security agencies should have an up-to-date record of the conditions of major rivers that need protection under such conditions. Protecting rivers is essential for the general health of the world environment.

²⁵ This figure varies. See later in the chapter.

²⁶ National Geographic Channel, 8 December 2002.

The total ground water on earth is estimated to be more than 50 million cu km. Of this, 4 million cu km is estimated to be moderate drinking water.²⁷ The demand for water is growing every year all over the world. The shortage felt across denies safe drinking water to at least one-fifth of the world population.²⁸ According to forecasts, depleting water resources coupled with an increasing demand for water is likely to be a major issue in the world in the future. This will affect two-thirds of the world's population unless mitigation measures are taken.²⁹ There are 28 countries affected by water shortage today (2004). This number is expected to rise to 50 by 2025.³⁰ The water deficit can be met by many ways, but the fact remains that these methods are applicable only to water available countries and not that have perennial shortage of water. Water shortage induces conflicts and war situations. Sharing of river waters at local and regional levels is also a major dispute area in many countries of the world. Water wars have been recorded as early as 3000 BC.³¹ Water sources were also targeted during war. The Assyrians destroyed the water supply to Babylonia in 689 BC, in a war. Many water dams were bombed during World War II. The central dams on the Yalu River were targeted in the Korean War (1950–1953). The United States caused extensive damage to the irrigation water supply in Vietnam War (1964–1973). Targeting water schemes was repeated in Iraq in the 1991 Gulf War. The largest dam in the former Yugoslavia was a prime target during the civil war in 1993. The Jordan River basin is a conflict centre in the Middle East. Israel, Syria, Jordan and Lebanon share the basin.³² Major disputes in the world on account of water are given in Table 11.1.

According to the World Health Organization (WHO), which pinpoints fast-growing population in poorer countries and water resources that are often squandered and polluted, the forces behind such disputes are clear. Around one-sixth of the 6.1 billion (2001) people of this world lack access to improved sources of water. One of its focuses is the tragic contamination of water in Bangladesh, where shallow wells were tainted by naturally occurring arsenic.³³

Riots over water were reported in India, which people claim to have been caused by privatisation of water resources. Resource gap is increasing between the rich and the poor. This causes riots in certain parts of the country; Ajmer, Jamnagar, Rajkot and Haryana-Delhi border have reported such riots. The police in Jamnagar in the state of Gujarat had to resort to firing to quell the mob in which three people died in December 1999.³⁴ India is facing serious problems with water resources. The

Government of India has a proposal to linked rivers into a water grid. It may not be a viable idea. River linking may look ideal but has serious ecological ingredients that may cause unforeseen harm and may even wipe out the entire water resources of the country if carried out in haste without serious study. The study has to be carefully carried out to examine the chances of upsetting the natural balance of individual linked rivers. Otherwise, it may end up into a great draught in which the rivers will vanish forever or a great flood that may cause unforeseen damage by inundation. Tail-end run-out could be a serious problem. It is a process in which the river or canal dries up at the tail end. The tail-end deprivation will take place if the interlinking facilities of rivers are not hydrologically balanced. Disaster security is linked with river linking. Serious model studies are, therefore, required prior to decision on this issue. The key decision areas in river linking are:

- (a) Need assessment
- (b) Future demand
- (c) Displacement policies
- (d) Legal issues
- (e) Policy matters
- (f) Economic issues
- (g) Ecological concerns: pollution transfer, groundwater issues, climate change and organism transfer over long distance

(h) Disaster issues—caused by artificial instability of centuries-old natural state of linked rivers

According to the studies by the UN, availability of fresh water in Asia is only 3000 cubic metre per person per year. This is the lowest in any continent.³⁵ Besides shortage, the quality of water is also a concern worldwide. Overuse and abuse are progressively deteriorating it. Seepage and migration of mineral fertilisers (phosphates and nitrates), pesticides and herbicides into surface and subsurface waters have become serious. This is in addition to toxic leaching and intentional burial of untreated toxic wastes over land that not only rendered them unfit for gainful utilisation but also disrupted aquatic ecosystems. Open sources of water like rivers and lakes are contaminated with garbage, sewage and untreated industrial wastes. Heated wastewater from nuclear power plants and other industrial facilities causes thermal pollution and its attendant problems to the water-based ecological diversity that assures quality of water in its natural habitat.

There are efforts world over to prevent contamination of fresh water. The measures taken should be supportive to the idea of pollution control as well as conservation by effective recycling. Advanced sewage treatment facilities have made it possible to obtain potable water purer than most stream water. Projects to remove salt and other dissolved solids from brackish surface water as well as from seawater have been undertaken in such countries as Australia, Kuwait and the United States. Water from desalination plants is generally suitable for household use and for irrigation. Other procedures employed for relieving water shortages include control of runoff and the reduction of evaporation by means of agricultural engineering measures.

In India, the availability is put to 2500 cu m per person according to a study in 1993. The dire consequence is that India may reach a state of water stress (when the average annual per capita availability falls to 1000 cu m or below)³⁶ very soon in the future. About 38.38% of urban population that lives below poverty line has no access to water.³⁷ Eighty percent of children in India suffer from water-borne diseases. Of these 700,000 die each year. According to the report, the situation is very critical. The crisis is real and urgent. Privatisation of water supplies has been thought out. But the scheme has many critics. Replacing the “big government” with “big private companies” for water management is hardly workable or just solution on a society with dark disparities according to critics. Even if introduced, such schemes should include mechanisms to treat the poor and avoid resource disparity. India is rated 120 out of 122 for its quality of water and 133 out of 180 for availability of water in

³⁵ Ibid, p. 2.

³⁶ Lester R. Brown. (ed.) (1993). *State of the World*. W. W. Norton & Company. p. 24. Hydrologists estimate water stress when availability of water drops to 1,000–2,000 cu m per person per year. A large numbers of countries are facing water stress in the world.

³⁷ Ibid.

2003.³⁸ Evangelical Fellowship of India Commission on Relief, a non-governmental organisation reports the availability at a dismal 1880 cu m per person per annum. It could decline to 1341 cu m.³⁹ It is close to the water stress point.

Water resources need to be developed and preserved for the future. Its quantitative and qualitative conservation is important in resource security. Problems related to water are far too many. Floods, droughts, pollution, lack of hygiene, disease transmission, abuse, etc. are the issues that water management organisations have to deal with. More catchment areas and reservoirs to catch and retain water for distribution will improve the efficiency of the system provided these constructions are human- and environment-friendly. Water is also a resource for energy. Hydro-electric projects work on hydropower that is eco-friendly. One-third of the developing countries' electricity comes from hydropower. To obviate the high cost of large dams, smaller hydropower projects are envisaged around the world. Large dams are also facing opposition from environmentalists and certain scientists for their damaging effects on ecological balance, geographical stability and social dislocation.

11.3.4 Food Resources

Food is a resource security matter. But this study considers food security as a separate element as it is important to reflect on it exclusively as an element to its criticality in the modern global governance which also impacts on national governance. Food is not only a resource but also resource intensive.

Global food production is on the increase and so is the demand. According to textbooks, 90% of the food that humans consume comes from about 15 plant and 8 animal species.⁴⁰ Four crops wheat, rice, corn and potato make up most of the world's total food production than all other food products combined. These are produced world over either traditionally or in an industrialised manner. Industrialised food production is more economical and eco-friendly than traditional means of farming. Livestock production is another aspect of food resources. The global livestock production is on the increase. Food is cultivated not only over land but also is gathered from the ocean as fisheries and non-fisheries products such as kelp, seaweeds and other edible aquatic plants. Ocean farming for fish and plants is already a practical idea. The world places much hope in the future of food from the ocean. Presently the ocean food production is primarily based on captive fisheries. Animal mariculture is closely followed by plant mariculture.

³⁸ Chaudhuri, D. "India's Drinking Water is One of the World's Worst". *The Asian Age*, New Delhi. 29 April 2003, p. 4. According to the UN, World Water Development Report: Water for People, Water for Life at the Third Water Forum held in Kyoto, Japan in March 2003.

³⁹ Ibid.

⁴⁰ Anjeneyulu, Y. (2004). *Introduction to environmental science*. BS Publications. 2004. p. 118.

Food resources are agricultural products that come from biological resources, the issues of which cannot be discussed in isolation in the world that is becoming international. The Food and Agricultural Organization (FAO) and the World Trade Organization (WTO) monitor food and agricultural management including research.

Food resources are dependent on various other resources that include natural resources such as land, air, water, biodiversity, fossil fuel resources, ecosystem services and so on. They are required not only for production but also for processing.

11.3.5 Metals and Minerals

Metals are elements, whereas minerals are compounds of various elements. This is important to understand the difference between metals and minerals. Metals rarely occur in the native form⁴¹ except few metals like gold, silver, copper, etc. On the other hand, minerals are inorganic substances having definite chemical composition and atomic structure and occur in nature. Iron is a metal. Iron occurs in nature in minerals like hematite and magnetite. Iron metal occurs in nature as oxides, sulphides, carbonates, silicates, etc. These compounds are called minerals. Metals and minerals are different from each other but not mutually exclusive. In a bit more technical explanation, a metal refers to a chemical element with a relatively low electronegativity and properties conferred by high mobility of its valence electrons. What does that mean? A metal can donate electrons. It also means a metal can be a good conductor of electricity and heat and will also be lustrous and opaque. The mineral on the other hand is a naturally occurring crystalline solid of a definite composition usually formed without the influence of life.

Metals and minerals are formed through geological processes that lasted billions of years. They are exhaustible resources. The interesting aspect is that the deposits of metals and minerals are very sporadic in distribution. Why is it so? Why they are not at least somewhat evenly distributed in a planet that shaped up in a systematic way? That would have at least given enough to the people to distribute around. It would have minimised conflict over the metals and minerals to some extent. Many African countries would not have been burning. The answer looks into the aspect of external receipts like a mail order. Probably they have come from elsewhere travelling over astral objects. So they remained where they landed and shaped up innocently oblivious about the sapiens ruling the world one day and then becoming one of the primary causes for conflicts among them.⁴²

⁴¹Native metal is the uncombined form of metal that occurs in nature. It is the pure, metallic form that does not occur in combination with other elements. Native metals are either found as native deposits singly or as alloys.

⁴²University of Toronto. "Geologists Point To Outer Space As Source Of The Earth's Mineral Riches". ScienceDaily. 19 October 2009. www.sciencedaily.com/releases/2009/10/091018141608.htm.

According to a study, the geologists are of the opinion that some of the minerals on earth may be extraterrestrial in origin. The argument is that the extreme temperature at which the earth's core formed more than 4 billion years ago would have completely stripped any precious metals from the rocky crust and deposited them in the core.⁴³ So, obviously they would have come from elsewhere, and the only place is outer space. Some of them therefore should have been results of an extraterrestrial rain of debris such as meteors and comets. According to geologists, four and a half billion years ago, the earth when formed was a cold mass of rock mixed with iron metal which was melted by the heat generated from the impact of massive planet-sized objects, allowing the iron to separate from the rock and form the earth's core. According to experts the notion of extraterrestrial rain also explains how the rock portion of the earth came to have hydrogen, carbon and phosphorus—the essential components for life, which were likely lost during the earth's violent beginning. Simply put everything on earth is not originated *ab initio*; some of them are gifted or transplanted subsequently by the forces of the multiverse. This could include life too.⁴⁴ If that is so, the planet may be in for some more surprises as the “rain” continues.

Metals and minerals are essential for industrial development. Availability of minerals and their strategic and industrial importance can value the national security concerns of a particular country. Demand for minerals and metals is increasing worldwide. Their conservation is value based. The cost of mining and transportation should be economical to control price. Mineral resources are unevenly distributed over the world. Many of the industrialised nations, though self-sufficient in minerals, depend upon the continent of Africa for strategic minerals. The main areas of mineral production and most known reserves are situated in the industrial states of the world in the northern hemisphere, in South Africa and in Australia. Japan and Western Europe have few of them. Offshore mineral deposits are always associated with continental shelf. These fields are increasing as and when exploration progresses. Mineral exploration has environmental concerns. Toxic pollutants from mining operations can contaminate water and land resources. Strategic mineral resources are important for military security and power buildup. Oil, manganese, tin, tungsten, chromium, cobalt, uranium, titanium, etc. fall in this category.

Asia is a large producer of mineral fuels. Coal is produced maximum in China and Siberia. Other nations with abundant coal deposits are India, Kazakhstan, North Korea, South Korea and Japan. The Arab countries collectively produce large quantities of oil. Siberia is rich in oil. It is also the biggest producer of natural gas. Other important producers are the Central Asian republics, Indonesia, Saudi Arabia, the United Arab Emirates (UAE) and Iran. China, Siberia, India, Kazakhstan and North Korea produce large quantities of iron ore and ores for ferroalloys. India and China are also among the major world producers of manganese ore and between

⁴³Ibid. Says James Brennan of the Department of Geology at the University of Toronto and co-author of the study published in *Nature Geoscience* on 18 October 2009.

⁴⁴Hawking, S. (2018). *Brief answers to the big questions*. John Murray. p. 73.

them account for virtually all of Asia's output. Asia's biggest producer of chromite is Kazakhstan, followed by Turkey, the Philippines and India. There is also some production of tungsten in China, Central Asia, North and South Korea, Thailand and Myanmar. Nickel is mined in Indonesia, Siberia, China and the Philippines. Central Asia has become an increasingly important producer of many of the ferroalloys. Asia is one of the world's main producers of tin-in-concentrates (tin ore that has been partially processed to increase the proportion of tin in it) providing more than half of the world's total production. Malaysia alone accounts for about half of Asia's production, followed by Indonesia, China and Thailand. There is also considerable production of copper ore in Uzbekistan, Kazakhstan, the Philippines, China and Indonesia. The bauxite produced in Asia represents only a small part of total world production, although production in Kazakhstan and Siberia has increased. Development of its eastern gold mines has given Siberia a leading position in the world's production of gold. Asia produces one-fifth of the world's sulphur, principally from Japan and China. Asia also accounts for more than half of the world's production of graphite, mostly from China and South Korea.

11.3.6 Energy Resources

Energy is essential for life's process in the modern and advancing world. Energy security is a specialised field and, thereby, a separate element of national security. Energy is necessary to do work. Energy consumption by human systems is increasing at an exceptionally fast rate raising considerations about their future availability for all in the world.

Energy is stored in matter. The matter that is used for producing work by releasing energy is the fuel.

Various forms of fuels are used in the modern world for generating energy. They are classified in different ways appropriate to the energy policies of the government. The common categories are renewable fuels, fossil fuels and nuclear fuels. Actually fossil fuels are solar cells of a different kind. They contain stored solar energy. Fossil fuels have certain disadvantage. Besides being non-renewable, they are also harmful for health and natural environment. The classification can change as and when the policies change. The fossil fuels are actually non-renewable but termed fossil fuels as they are the only fuels used from non-renewable resources. Nuclear fuels are given a separate status due to their global regulatory and utility nature. So from the policy point of view, there are three types of energy sources.

Further energy resources can be divided as conventional and nonconventional energy resources. Conventional energy resources are those being traditionally used. The rest including nuclear resources come under the nonconventional resources.

The main sources of energy as seen today are coal, oil, gas, nuclear, solar, wind, tide, etc. The demand for energy resources is expected to grow in the industrialised world. Fossil fuel (mainly coal, petroleum and natural gas) is still the primary source of energy. It can change with the introduction of nonconventional energy resources.

Sources for nonconventional energy are the sun, wind, tidal power, wave energy, geothermal, mini and micro-hydel, ocean thermals, biomass, nuclear power and hydrogen. Strategic energy reserves are important in an uncertain world. Identifying energy alternatives is necessary to ensure energy richness. Energy availability should not be based on political preferences. But political preferences driven by market conditions and forces cannot be avoided. The supply and demand of energy sources flutter considerably under market flurry and global political scenario changes. Any hedging against resource supply limitations should be done by careful planning for production and substitution of conservation of energy.

There are sustainability concerns about the energy resources that could affect their usage. Fossil fuels can cause harm to health and environment. Solar energy is considered to be natural and most acceptable except its commercial viability and user-friendliness. The source is unlimited and non-polluting. Solar energy is all pervading in relation to life on earth; hence exploiting solar energy for human quality life will be a welcome turn in the use of energy. The tidal forces created by the sun and the moon on the waters on earth could be successfully used to generate electricity. It is non-polluting and renewable. Both the solar and tidal energy resources have technological limitations in exploitation.

Nuclear power is generated by two different methods of nuclear process: fission and fusion. Fusion is the process in the sun and solar power is a fusion result.

There is also hydrogen fuel cells which is energy stored in chemical bonds. They are nonconventional and environment-friendly but face technological and economic limitations presently.

The most common energy resource today is petroleum. It is the natural hydrocarbon under the earth's surface as oil and natural gas. Petroleum is transformed organic matter buried rapidly without oxidation under the earth's surface under pressure.

Energy resources for the future are expected to be different from what is in vogue today. The society cannot rely on fossil fuels for long. It is not because they will be exhausted being non-renewable but also of their negative values in relation to sustainable development. Nuclear fuel is a source for future provided it is made safe, economical and under control to prevent dual use that may lead to weapon proliferation. Tar sands and shale may replace oil even though they are also non-renewable, though in the long time. Among the renewable sources, there are possibilities of the world focusing on hydrogen cells, wind, sunlight and geotherms in limited localised conditions. Future energy resources have huge environmental, political and economic implications that will be the deciding factors for future energy choices.

11.3.7 Strategic Resources

Technically, strategic resources are those identified in the national security strategy as envisaged by a government. They are also the critical resources for governance.

To this extent national security strategy is a competitive long-term strategy carefully planned and periodically amended by the government. There are various ways of expressing strategic resources. They are vital assets generally valuable, rare, difficult to imitate and non-substitutable. Being strategic, governments will have to see that they are exclusive, and competitors or adversaries deny them. These resources are expected to support a government in decision-making towards achieving strategic goals of governance towards national security and sustainable competitive advantage. Strategic resources provide resource advantage to a country in governance. There are various ways of looking at a strategic resource. These are to be decided by the government organisations based on the strategic plans.

Strategic resources are expected to provide edge over others by holding the possession of an item that will support achieving the strategic goals competitively. Such a resource will have the following criteria in organisational management:

- (1) Valuable (V): Resource value.
- (2) Rare (R): The resources are scarce (unique), whose existence is difficult to find the resources.
- (3) Imperfect imitation (I).
- (4) Non-substitutability (N).
- (5) Orientation (O).
- (6) Quality (Q).

National security governance, however, is different from organisational governance. The strategic resources in this study are primarily for national governance with a competitive edge. The competitive edge required is against the adversaries external and internal to the nation. The resource security optimisation may face many threats. Challenging these threats need appropriate strategic resources. The government will have to identify them and provide strategic optimisation of resource security accordingly.

First, it is important to understand that strategic resources meant by this book are not those commonly misconceived as resources to fight a war, for example, oil. It involves a stock of all those resources that are essential for the nation on which it can depend in case of an unexpected demand surge. Such demand may come in case of war, disaster, price escalation, etc. Strategic resources are supply situations created to override the problems associated with a specific resource in a critical situation. Food reserves in a drought situation, oil reserves in a war situation or during price escalation, medicines during a disaster situation, etc. are examples of strategic resources. It is a relative expression based on a situation. In managing strategic resources, the government has to identify the potential strategic resources in advance and plan for its storage and mobilisation when demand increases. Often the requirement is for a short period and for a definite purpose. The idea arose from strategic war resources. Strategic resource stock and mobilisation determined the duration of wars.

Analysing the requirement of strategic reserves of resources for meeting an unexpected demand is an expert activity. The underlying principle is the overall cost-benefit analysis. It could even be done without actual stock but close

international understanding and agreement by geostrategic appreciation for assured supply of resources. Governments are aware; but often, strategic reserve management can end up costly and ineffective—surplus, shortage, waste, poor mobilisation, etc. will be the inherent problems, when they are least wanted that could jeopardise the system.

11.4 Resource Overshoot

Resource overshoot can cause more damage to national security than an aeroplane to air traffic operations by overshooting the runway while landing, if the latter can be used as a biomodel. In the latter there is a chance for the plane to pull up and attempt another landing. It is applicable to a small resource-centred activity to the entire national security strategy. The only choice is to prevent or pre-empt the overshoot. National and global resources, whether non-renewable or renewable, are limited in use value to human systems by quantity, regeneration, accessibility, techno-economic viability or environmental compatibility. Ideally, the use of a particular resource needs to be stopped under one or more of such conditions. It is difficult to predict the overshoot sufficiently in advance or find alternatives to the resource that is unavailable. The overshoot is when resource consumption exceeds regeneration or replacement in a simple resource model.

Global Footprint Network, a privately funded internationally operative organisation, calculates, according to them, the ecological limits of earth and human systems and provides decision information with a menu of tools to operate human economy. The Earth Overshoot Day (EOD) as it is termed when the earth's natural resources are used up for the year is a privately declared. That is the day when the planet's annual "budget" for natural resources such as soil, water and clean air is used up. This analyses the trend in which the humanity is consuming resources in 1 year. This is similar to a family budget planning. Its importance to governance is not tested so far as there are many such methods by which the world can assess sustainability in relation to resources.

Various other studies show a good chunk of the world population is in danger of running short of drinking water. The United Nations World Water Development Report 2019 shows that, if the degradation of the natural environment and the unsustainable pressure on global water resources continues at current rates, 45% of global GDP and 40% of global grain production will be at risk by 2050. Poor and marginalised populations will be disproportionately affected, further exacerbating already rising inequalities. Furthermore, in an increasingly globalised world, the impact of water-related decisions crosses borders and affects everyone.

For the IPCC, land is not just a critical resource⁴⁵ but is the terrestrial portion of the biosphere providing the principal basis for human life, including the supply of food, fresh water and multiple other ecosystem services, as well as biodiversity. The report especially explores the interlinkages between climate change and land usage. Human use directly affects more than 70% of the global, ice-free land surface. Since the pre-industrial period, air temperature over land has risen nearly twice as much as the global average temperature. Climate change has increased food insecurity, negatively affected ecosystems and led to desertification and land degradation. When land is degraded, it becomes less productive, restricting what can be grown and reducing the soil's ability to absorb carbon, thus exacerbating climate change.

Air pollution is a serious killer. More people have died around the world because of air pollution than malnutrition, alcohol use and physical inactivity, according to the annual State of Global Air 2019 Report. Worldwide, air pollution reduced life expectancy by an average of 20 months in 2017. Lost life rises to over 2 years and 6 months for children born in South Asia, where air pollution is worst.

A suggestion here is invoking the half-life theory on resource allocation and usage to contain resource overshoot. In this case it may be possible to govern resources to prevent overshoot based on the half-life theory of each resource as applicable to the nation. This demands the resources that need to be brought under half-life system and taking efforts to increase their half-life by quantum increase and where such increase is limited to contain their usage identifying methods including waste control not to exceed the half-life limitations (Box 11.5).

Box 11.5 Half-Life ($t_{1/2}$) Theory

The term is borrowed from nuclear physics. The author considers it can be used in national security studies for application in sustainability studies. It needs to be researched further. For example, if used in resource security, it is the time required for a particular quantity of the considered item to reduce to half of its initial value or quantity. In nuclear physics half-life describes the radioactive decay of unstable atoms or the time stable atoms survive. Decay is one of the four fundamental forces of nature.⁴⁶ It is called the weak force (nuclear 2). In the idea of half-life, if used in budgeting, a government may be able to calculate the time when it will end up with the budget if half-life is taken into consideration. It may help regulate expenditure in planning the budget. The converse of half-life is doubling time as in an investment. Half-life calculation of resources may help in planning the overshoot and allocation.

⁴⁵IPCC. "Climate Change and Land: Summary for Policymakers". https://www.ipcc.ch/site/assets/uploads/2019/08/4.-SPM_Approved_Microsite_FINAL.pdf. Accessed 17 August 2020.

⁴⁶The other being gravity, electro magnetism and strong force (nuclear 1—the binding force).

11.5 Allocation of Resources

Resources are productive assets of a nation. Their constructive apportionment among the users, or productive allocation, is a strategic decision since they are in limited supply and, in most of the cases, demand increases constantly as the nations grow. Besides, any given resource can have many alternative uses. Allocation calls for pricing of the resources in a planned economy besides regulatory measures with a political tone. The price is the only yardstick, and it will fluctuate based on demand and supply for the nation and the people. The methodology is to allocate resources to obtain maximum possible output from a given combination of resources maintaining sustainability, whether renewable or non-renewable, balanced. This is hypothetical, but the success of allocation depends on how close the government machinery can achieve it.

Opinions vary on resource allocation. Some assumes that resources, even those that are stored by earth, are infinite as long as market prices are high enough to make profitable extraction possible. It is ideally correct, but not practically true because the resource is finite in real sense and will exhaust one day. It will be unreal to assume that resources are infinite. In resource security, the management of allocation has to be based on the limited availability of resources by quantity that is not renewable. Another problem is relative devaluation of assets that go with the resource extraction and mobilisation. The infrastructure in a resource handling facility gets depreciated when the particular resource is depleted or demand for it is declined. There is a certain complementary nature in a system that has to be examined through considered tradeoffs embedded in resource exchange in the process of production. The nature's ability to renew itself is a great economiser. But such systems can be effectively blocked by cost-price incentives of market economics.

Depletion of resources is natural with economic advancement and human development. The rate of depletion can be calculated with mathematical precision, and such calculations are available.⁴⁷ According to geologist M. King Hubbert, the production-depletion curve for non-renewable natural resources is bell shaped. The production increases slowly, then sharply reaches the peak and then declines in a mirror image before it is exhausted.⁴⁸ Undifferentiated growth can cause depletion of resources at varying rates. The remedial measures recommended by people vary. For some, it is arresting population growth and curtailing economic growth. For others, it is finding alternative resources and balancing out the population. The solution may lie elsewhere and often vary from country to country with a global solution for monitoring resource management. It is also necessary to know that there are limitations to human intervention in economic growth as well as population. That will happen even if curtailed, because the compelling forces are inbuilt in the human evolution. Here the choice is whether to be in pace or out of pace with these forces.

⁴⁷ Capra, F. (1982). *The turning point*. Flamingo. p. 226.

⁴⁸ Ibid.

The preferable method is to be in pace. At least that will avoid uncertain complications.

There is a certain amount of dependence of resources within themselves. Energy resources are highly depended upon other resources. This dependence is more capital intensive than labour intensive. The price climb, therefore, is certain when the resource depletes. The consequence is unprecedented inflation that will affect economic security. Instead of capital-intensive resource dependence, some researchers advocate labour-intensive resource dependence to limit inflation and environmental damage. The practicality of these advises is required to be seen. But national governance has a way of settling down when handled by experts on the issues by adapting to the most suitable remedial measures for a particular country. Rapid technological changes are making available previously uneconomical reserves of resources. Resource security will be an issue in any nation's security policy. Another challenge is to produce them without causing environmental damage. The major issue today is the greenhouse gases that are said to cause global warming.

Globalisation has its impact on resource management. Global balancing forces govern the supply and demand of resources. Often this control is much beyond the control of nations. Market forces, rather than command economies, will decide production decisions. There will be deregulation in many countries to adjust with globalisation and market forces. Productive allocation of resources is when more is yielded from less. It means more efficiency in production. The input is less and the output is comparatively more. In such cases one of the inputs is resource besides capital and labour. Resource allocation for an industry that can produce more from less is the most preferred way of allocation. It does not happen automatically. Such productivity has to follow a particular economic system. That is the one that needs to be identified. Thereafter resource allocation becomes optimum. In the national scenario, it is productivity with less that matters. Identifying a sympathetic economic system for such productivity makes considerable difference. However, excess production does not mean surplus production. Production should be demand driven.

While resource allocation is discussed, the world often tends to forget the problems of indigenous peoples who, more or less, live with nature and have been haunted out everywhere. The mountains, forests, grasslands and the islands they live virtually in technological isolation are getting deprived of natural resources by the modern humans' extended grasp to satisfy their needs. The indigenous peoples, where they exist, are part of the nation that holds their habitats. Some of these nations are very advanced and civilised. The indigenous peoples have very close affinity to their ancestral terrain—the land, water and all that belong in there. They are losing them without hope of getting replenished in their fellow citizens' priority existence. Indigenous peoples exist in every continent and in most of the countries. According to anthropologists, the definition of indigenous peoples is what they think of themselves—distinct from their countries' dominant group. They are members of

distinct people.⁴⁹ Their resources are in relation to their habitats—land and food resources around it including that in the sea if it is a coastal or island area. Developmental activities, pollution, lack of identity in national matters, etc. have made them resource-refugees within their own habitats in most part of the world and slowly pushed to the brink of extinction. Resource apartheid will ultimately wipe out the indigenous peoples, especially those who prefer to be in their own isolated habitats without affinity for merger with the world beyond them. That will be a sad state of affairs if permitted to happen, especially when the nation they belong (in some cases unknown to them) has equal responsibility towards them as it has with other citizens. This is especially so when the demand of the indigenous peoples for resources is only for subsistence economy which, comparatively, is much less than the demand from their advanced fellow citizens elsewhere.

11.6 Mobilisation of Resources

Mobilisation of resources is to make them available where required from where it is produced. The lines of communication of resource mobility over land, air and sea are vital for a nation. At the global level, vulnerable countries will need protection. The superpower's concern in such a scenario can be protecting the interests of vulnerable nations from neighbours and those whom it does not approve. This will also be their overall interest in world domination. The nature of behaviour of the world dominator may vary depending upon who occupies that position. Generally, those whom the superpower may not approve have come to be called rogue states. The choice for such "rogue states" will be to intervene with a force mobilised primarily by itself with the support of other sympathetic regimes under the mandate of the United Nations or otherwise. Often it will not be possible. The world will be divided in opinion, and as the states lose control over money and governance by globalisation, the effect of such protests will be limited. Mobilisation involves production, storage and transportation. All three possess challenges of pollution and disaster prevention. The demand at the global level will govern the supply of most of the resources, especially energy and minerals. Governments and regional blocks may have limitations in controlling it. Most of the countries of the world rely on imported resources in one form or another. Strategic resources for military purposes are a matter of concern for highly militarised countries. International mobilisation of resources will be primarily by sea. International maritime security of sea lines of communication (SLOC) will call for heavy concentration support decisions to provide security for ships that carry oil, gas, minerals and other cargos of resources across the world. The progress of transportation shifted to sea and internally to rail and road. There has been considerable development in the use of ports and harbours and concurrently on the security implications of the mobilisation infrastructure. Unit model

⁴⁹Brown, L. R. (ed.) (1993). *State of the world*. W. W. Norton & Company. p. 81.

transportation that links up cargo by sea to internal resource depot by rail and road promoted containerisation that in turn has also evoked interest of security experts since the containers can be stuffed elsewhere by dangerous cargo other than what is mentioned in the manifest. This has brought out the paranoia of container security initiative (CSI) among nations that expect terrorist to use containers to transfer terror materials.

Air transport is swift but is expensive and limited in volume. It is appropriate for high value-low volume and emergency resource transportation. Air transport has a particular role in landlocked geographically disadvantaged countries. Air transportation can mobilise resources to relatively inaccessible areas. An interesting mode widely followed over the world is animal transportation. In many parts of the world, it remained the cheapest form of transportation not only in energy consumption but also in infrastructure demand for mobilisation.

Inland navigation is another means for resource movement. A good river and canal system, if available, is an economically viable means for carrying goods and passengers at small cost over considerable distances. There are many countries that have well-developed internal water transport systems. Such transportation systems call for river and lake ports and dredged channels for vessel movement. Laos is an example in Asia where a landlocked country is connected to sea by an extension of inland navigation facilities on the Mekong that runs through Cambodia and Vietnam into South China Sea. Motorised barges supplementing traditional water transport provide relatively speedy transportation where inland water navigation systems are organised.

Another choice is pipelines for liquid resources. This can cover most of the areas and can be great saving in long-term mobilisation. Even the ocean bed can be used for pipeline transportation. The advantage of pipelines is speed and direct connectivity with the users' production infrastructure as in the case of oil refineries. The disadvantage comes from security concerns, pollution and cross-border political implications.

The element of resource security along with energy security will play a dominant role in national security. It will have an impact on rethinking and modifying geostrategic security concepts. It will depend upon resource availability and demand. Energy resources are included in the overall resource security calculations interactive with the element of energy security. The general trend is that resources will be ample and wars or conflicts over resources may not be a cause of serious concern for the United Nations and concerned population. Forces especially that of the more powerful countries may be deployed to ease out the choke points for resources, and a warship escorting a tanker or a ship carrying strategic minerals may not be a rare sight. But such convoy systems for resource mobilisation are actually a costly endeavour, which often the nations involved do not realise. Technology and economic trends show promise in extracting previously uneconomical reserves of metals and minerals. The supply and demand issue will still prevail. The demand will increase when growth is fast. In a seemingly undisturbed situation in worldwide resource security, strategists however warn that there could be issues on specific

resources. Resource mobilisation will be an active factor in strategic thinking for these reasons.

11.7 Anticipated Resource Constraints

Equity of resources is talked about in social sciences as a measure of capability of human systems. Human systems are settled within the nation state concept. Each nation has varying resources, some scarce and some abundant. In reality there is no equity of resources among nations. Nation states are not formed that way. Even within a nation, its sub-parts are not divided in equal resource terms. It may be topographical divide, ethnic divide, language-based demarcation, etc. Resource equity within a country is achieved by distribution based on demand. Equity in the world is again ideally achieved by this principle. But nations feel the crunch when they meet with constraints that can vary.

In the melee of resource management, there may be resources that may not meet the demand. Such resource constraints call for critical examination of resource yield. Water and seafood are the identified critical items in the resource-constraint module. Scarcity of water has already been elaborated in this chapter. Over-fishing and lack of regimes that can regulate fisheries in the world in spite of the efforts of the FAO to unify the Code of Regulation for Sustainable Fisheries (FISHCODE) along with fisheries monitoring, surveillance and control (MCS) formula at sea through national forces in the world are similar resource problems. It is coupled with environmental degradation of the seas, a serious issue that is under detailed discussion periodically at the International Maritime Organization (IMO) under the watchful eyes of the commercial players in shipping on one side and environmentalists on the other. Certain maritime species that were once plentiful are only seen in animated Hollywood movies today.

Reliance on imported materials is another resource constraint. Nations cannot do away with it. Almost every nation is dependent on import of some resource or the other as a national security concern. While there are many factors of constraints, globalisation has made the process comparatively easy. Here, though the governments may find it difficult to limit markets, especially raw material markets, under globalisation it is to be considered more as a catalyst for the flow of resources rather than a constraint. Resource security can be steered by the governments by taking advantage of the system like piloting a ship in an opposing tidal stream. Resource security planners have to be concerned about imported resource constraints that will have to be addressed in geostrategic forums for effective results. This interaction between other elements of national security is important.

Maintaining resource reserves to tide over constraints for critical resources is another method. Calculations based on demand with an eye on the future in a short-term as well as long-term scenario will provide free flow of resources under items of constraint. These systems are applicable only to certain specific resources like fuel, food, strategic minerals, etc. Incentives could be given for private stockpiling in

countries where there is no reservation for privatisation. There are countries that will have internal resistance for privatisation. That is an additional constraint. The bottom line is cost-effectiveness in reducing constraint. In this scenario, resource security becomes an issue of logistics. It could be managed conveniently under the advanced principles of logistics management.

Cost-effectiveness comes out of price fluctuation by demand and supply theory. Price increase is also associated with social stress, conflicts and political upheavals. But resource prices are comparatively stable where it is available under the globalisation regimes. Technology is the main contributor for price stability since production costs are reduced with higher technology. There is also better waste control. Besides, price increase also turns the resources idle with alternate resource use. Technology overcomes the demand-induced price rise in resources—at least for now.

There are problems with resources that are not normally imported. An example is water. Perhaps the world may have to find better solutions for water resource equality to improve the quality of life. The problems associated with water crunch are supply limitations, cost of preparation, contamination, energy needs, agricultural needs, industrial requirements, etc. The demand for water is high worldwide. The solution is increasing the quantity of fresh water on earth with an eye in the future as in the case of any other resource on which the humans are depended. Water harvesting, effective utilisation of river and lake basins across the countries, improving efficiency of water systems avoiding waste, etc. are recommended procedures but rarely practised since ignorance of the users upsets strategies. Public awareness is the key. It is a lot of hard work. Information about resources and geostrategic security are interlinked. It is important to reiterate here that issues of national security can be resolved easily only under win-win situations. Resolving water disputes cannot come easy and so are the win-win proposals. There are limitations. But the efforts should be towards it. International law on water sharing is clear, but their practicality is based on consensus. A more effective method is to leverage on international law for bilateral agreements.

11.8 Worldwide Resource Web

The idea of a worldwide resource web (WWRW) is just a passing thought unlike the world wide web of cyber network. It is a proposal for a global resource web along with a strategic resource transportation model for a matured world and its responsible governments. It has to be under consensual global governance which at the moment is an impossible dream. The proposal is for an international resource web or rather a considered suggestion with firm belief in its practicality in a matured and responsible global system. The assumption is that the world has gone much ahead of the early barbarian days of resource politics and killing though the brutal handling of

issues similar to the erstwhile Belgian Congo⁵⁰ or other countries still continues today for seizing power today. It is almost practised, though in a crude manner by many nations. It is a proposal for networking resources to connect them with the location where it is available with where it is required across the globe based on demand and strengthened by geostrategic security. Such a system ideally could make the resource hungry human systems satisfied but also lead towards managing other elements of national security in a positive manner. With respect to any other ideological systems, the global web idea also suffers from the usual drawback of human exactitude and lack of it in managing political systems. The impossibility of such a network is hidden in the conflicts the world had witnessed and still ongoing in the most resource-rich continent of Africa where the leading players were outsiders since the earliest times. Resource richness was the “crime” of Africa, and that leads to their state today, it could be said. The African nations were neither able to defend themselves from external interventions in the name of resources nor bargain for the better. From the point of view of resource security, Africa thereby became a serious threat attractor by its resource richness and a battlefield of interested parties; it was more during the Cold War and under apartheid regimes.

The nations of the world are not created on equity of any sort. They are also not equal in quality of life and any other human positive infinitude. It is not possible. They have different fingerprints. Resources are not equally distributed like in a social security system. The basic principle of global security is expected to be to network the world into a balanced system of humans. Resource sharing is important to maintain this equipoise. It in the world today is based on trade agreements and geostrategic preferences. There is imbalance and coercive forces in the system. A resource web in the long run is an international resource security imperative if the world has to progress together, the best method of development in an orderly system. More so, it is a geostrategic imperative. Such a web will be live and vibrant if it has international approval. However in the globalisation process as seen in economic security matters, the game is outside the court of nations in many aspects. Private international bodies may control resources more, but that could be managed well under an international organisation. The suggestion is based on a forecast that resource equipoise for global security can only be brought under global governance. It may sound ideal today, but the world will be drawn towards such a system slowly when the resource crunch is felt seriously. Symptoms are there in biomodels. Allowing a pipeline to pass through to a neighbour who is an identified enemy, in certain parlance, by a country is such a step. But a world wide web of resources is much beyond such arrangements that does not exist today, but is certain in the future

⁵⁰Patrice Émery Lumumba (1925–1961), the Congolese politician and the first Prime Minister of the independent Democratic Republic of the Congo from June until September 1960, just 4 months, played a significant role in the transformation of the Congo from a colony of Belgium into an independent republic. Untimely he paid with his life when ousted out of office and assassinated in a political crisis caught in the web of Cold War. The region of Congo in Africa in whatever name it is called always remains a cauldron of resource threat attractiveness then and now.

when the demand heats up and nations become wary of dependency on coercive methods. The international organisations could plan them today.

The suggestion on a worldwide resource web here is not out of context. It is based on the ethical practices in human system. The suggestion needs further examination of resource ethics.

11.9 Resource Ethics

Ethics in the original sense can be easily examined by rewinding historical and philosophic notions of expected human behaviour towards each other in a system. Ethical practices come under different categories in a broad sense. They include deontology, utilitarianism, rights and virtues.⁵¹ From the individual human and group point of view, ethical suggestions are validated assessing human obligations, duties, collective behaviour, values, human worthiness, conduct and so on. The call for ethics comes from the human expectation that survival of one is intricately linked with the survival of the other which also means everyone. Resources are critical for human survival. Therefore sharing resources in a way that is acceptable to all and preserving them from exhaustion and deprivation for future generations is a value-based approach in governance under resource ethics. Resource ethics is not just talking about protecting resource values or refraining from cutting trees or polluting environment. It is much more than that and reaches its practical value when the global systems learn to share critical resources of human comfort. The suggestion is to make a worldwide resource web materialise.

11.10 Strategic Resource Access and Denial

Strategic resource denial is part of strategic governance of national security. This aspect is not about strategic resources or its denial. But strategically denying resources to another government or user who contravene responsible governance procedures can delay their rewards. It will be desirable for common good. For example, in a process of drug refining denying critical resources (acetyl anhydride in opium refining into heroin) could be a successful formula to deny the drug producers the opportunity. By denying resources the unlawful activists can deny the rewards. Denying nuclear access to irresponsible and unlawful parties can prevent proliferation of undesirable destructive agents.

⁵¹ Paleri, P. (2020). *Corporate social responsibility*. Cengage Learning India Pvt. Ltd. pp. 32, 123 and 292.

Resource denial during wars has been much demonstrated. Access to resource leading to wars has been since the time of Trojan War (Chap. 9). Resource access and denial are continuing games in the global playground. The motives for waging war in the early days of the last century by the denial of vital resources were very strong in the military context of industrialised economies. Oil has been another prized thrust resource for access and denial in resource security governance. Oil became one of the resources for denial in world wars by the sinking of petroleum tankers in naval warfare. Denial of resources is part of the grand strategy of nations who have them and access to them for those who didn't have. This has now percolated into the other-than-war scenarios also where nations support sanctions that will deny release of resources to identified slim customers in geostrategy.

11.11 So, What Is Resource Security?

Resource security, in this study, is the third identified element of national security in the chronological hierarchy of 16 elements. Resource security, "resourcesec" in short, with the symbol " r_s ", is about optimising national resource requirements at any given time for the overall maximisation of national security by governance.

Resources are critical for the development and sustainability of the human system. Resources need to be governed sustainably. Resource security is a global issue. It is not restricted to the nations alone. Cooperation between nations and human systems within a nation is essential for optimisation of resources. Nation states and even human subsystems within a nation are not formed on the equitable appropriation of resources. One country has to depend upon another for resources that are short but high on demand. Even then there are resources, especially those critical to national security like water, which are not easy to acquire from another. Water has become a priced commodity even extending to futures.⁵² Water is life traded in a bottle. It is one of the serious ironies humans played on nature, that too on the planet of life. However, other life forms are free from commercial water unless under exclusive domestication.

Resources for sustainable life have to be shared under thoughtful appreciation and understanding. Global sharing of resources and resolving conflicts related to resource acquisition are subject to international law. Resource wars and conflicts are much reduced in the world. Problems to resource security by total depletion are not envisaged in the immediate and not too distant future by strategic planners. Prices may fluctuate based on market forces at the global level on certain resources like oil. But the governments and planners may imagine a variety of implausible scenarios. Strategic reserves will hedge against supply interruptions and constraints.

⁵²“Water on Wall Street: Finally, humanity can bet on the future price of water”. <https://www.downtoearth.org.in/news/water/water-on-wall-street-finally-humanity-can-bet-on-the-future-price-of-water-74585>. Accessed 15 December 2020.

The reserves have to be scientifically calculated for cost-effectiveness, lest the impact should be felt in economic security.

Decisions in resource governance need to be well thought out if they are to be efficient and effective. Resource security governance involves many factors. All of them are associated with maximising national security. It depends on the process of national security governance chosen by the government. Resource sustainability involves regeneration, waste management and cost control. Sustainability model for resource takes the shape of a closed-loop system ideally. Often it is not possible because there are many resources that are non-renewable. There will be issues related to overseas resources, some of them strategically important. In the olden days, resource crunch was overcome through military campaigns by the powerful. In the modern sapient period and in the future, geostrategic security applications are suggested to overcome external constraints.

However, there is much need to be done for global cooperation for resource security by effective policies that will regulate resource sharing, resource denial and following a resource web and sustainable development especially on vital resources of human kind. Within the framework of national security, a government can invoke other national security elements to maintain and balance resource security in a way that will assist the nations of the world. The United Nations may have to establish their responsibility and accountability as the team leader in shared global resource security through appropriate policies and measures.

11.11.1 Definition: Resource Security

Against the background of this study, resource security means “the capability of a nation for sustainable and conflict-free acquisition and optimal utilisation of resources that it requires for maximising the well-being of the people with due consideration to the global human system, perfectly aligned with the other elements of national security and integrated with all the terrains of national governance”.

11.12 Summation

In this study human resources are the resources humans use. Humans are not resources; they use resources. Human resources are simply resources, as humans call them, for sustaining human life and elevating human comfort. Human resources would have been collectively global commons in an idealistic scenario. But it is not so. It can never be. There were signs *ab initio* when *Homo sapiens* fought for a handful of fire in the primitive days. Resources are owned by various individuals, organisations and nations except for a small part understandably reserved or left behind as global commons. Primary reasons for global commons remaining as what they are access limitations either physically or technologically. The world has shown

the good sense in modern times to retain the part of the planet not owned by anybody as global commons for the benefit of all. Various limitations still make the humans to remain as scavengers and gatherers of the old kind even in modern times. This is visible when they chase the wild honey which the bees have collected from elsewhere or get into the expansive ocean and hunt and gather fish. There are other practices too that invoke the scavenger-hunter-gatherer behaviour not only chasing living resources but also non-living resources. That is the way humans evolved and settled. That is the way they will go on.

Humans share resources unequally. They share them under considered distribution or impetuous conflicts. Demand for resource has caused many conflicts all around resulting in much bloodshed. The conflicts still continue. Only the format has changed in certain cases. It is expected to continue in the future too unless there is a common system of resource governance acceptable to all. It could be under a centrally governed web or any other acceptable mode without conflicts. But it is difficult to get such ideas accepted in the flurry for survival. Sharing of ocean resources with landlocked or geographically disadvantaged nations by the coastlands⁵³ or islands is already a reality as law but not yet become practical as a common practice. Within this realistic scenario, nations have to design their national security appreciation for NS_{\max} .

Another suggestion in this book is the calculation of half-life of resource systems and managing them appropriately. Presently it is only a suggestion with a recommendation for scholars to examine. Detailed procedures and processes are yet to be seen and availed.

The specific resource security orders for national security may also include resource denial to other systems which may be executed only in the ethical way without violation of common practices of mutual respect in the human system. Any conflict or hard sell between governments brings hardship to people of the countries involved and also to third parties as in a war. Resource denials and conflicts, therefore, need to be calculated to minimise sufferings to uninvolved innocent humans. For example, it may be appropriate for controlling worldwide unlawful activities or damaging acts of irresponsible human systems. An example is denying acetyl anhydride to drug refineries to prevent the production of heroin from opium. It regulates the Crime3+ in drug production. But denial of water by blocking the rivers or creating flash floods by releasing reservoirs is not acceptable behaviours in governance. Such acts are degenerative in modern human systems. It is time for humans to become sapiens by grading themselves upwardly moving in the worm tunnel of unitary civilisation. Otherwise it will be bad for future generations.

12.1 Introduction

Human systems persist on the part of the earth's crust which is generally dry and not underwater. They call it land or ground. They are survival fit only on it, at least for now. Humans live on dry land. Land is important in a person's life for this reason. Every human craves for a piece of land to call one's own. Only a few get it. Millions do not possess even a needle space of land¹ to call their own. Some of them may go

¹The Kurukshetra War in the ancient Hindu epic *Mahabharata* was fought between the cousins, the Kauravas and the Pandavas of a single family. Lord Krishna, the mediator acceptable to both requested King Dhritarashtra, the father of the Kaurava princes for a small piece of land within the kingdom for the Pandavas outlawed by the Kauravas on dispute. Lord Krishna's diplomacy didn't

loony like Boris' father in the movie *Love and Death* (1975)². That is rare. But humans can kill for land even within their own families.

Every human today has a country to call his or her own; the size and nature do not matter. More than sovereign perfection, according to the author, the Treaty of Westphalia straightened out this craving by providing a space to people to call their (own) nation or nation state within a recognised boundary which they could own, administer and govern without asking anybody else. Humans find a nation comfortable even if they don't have a piece of individual land because they are designed as social beings that can be together. There were no recognised nation states in the olden days before the sovereign model. People suffered mentally and physically under the powerful, who snatched and possessed everything they could. For the powerful, the land they seized and occupied became their own until someone else snatched it away forcefully. But under the law of invariance, the grandeur of possessiveness continues in the form of border nibbling, assertive claims, etc. For the ordinary human, having a country satisfies the craving for land to a great extent. Refugees and sneaky migrants lack this privilege. They panic under existential drudge. The sinking feeling in the absence of a piece of land individually gets diluted in the national geoproduct appreciation. Notwithstanding this craving, people are restless, even if they own land, unless the boundary of the space owned is clear to the owner and also to others who are outside it. With land comes the problems; the serious among them is the absence of clarity of its boundary. In this context, the meaning of national border is the accepted geophysical perimeter of the recognised human system. Interestingly, the quantum of area doesn't matter for humans. It is not known whether other life forms too insist on typical area limits and border noise. Perhaps they do.

In all prospects the underlying principles of sapien style of life cannot be vastly different from those of other animal forms in its basics. It cannot be, as life is a single chain though with various offshoots along. The base course of life's development can be identified within these resultant deviations enroute as a singular path forward for all. One of the attestations is veiled in the basic instincts and the underlying formats that keep them going through genus to genus and species to species at the moving end of classification. The author prefers to name it the geno-biomic rapture of a single creation—all animal life forms are one evolved from a singular process. This perhaps is what makes no living form different from another in importance. Every living thing is equal to each other as a fleeting product of life-giving and life-sustaining forces. There are no inferior-superior formats in geno-biomic appreciation unless one insists on it for a specific purpose. So, where is the difference?

Perhaps the prime difference in life forms is in wielding the designer survival tool applicable to each in its respective life extent. Each one should be in its relatively advanced form when its survival tool is perfectly in shape and precisely wielded.

succeed as the King refuted the request and denied even a needle space. War became the only choice.

²See Chap. 11, Note 20.

Can a Cambrian worm be different from a modern sapien metrobilly? Well, it depends, but not for the author, who considers them alike. No one life form can overwhelm another except by impeccable use of its own survival tool in a one-on-one survival duel. The Davids can defeat any Goliaths this way, and every Samson may lose power after a good haircut if it is hidden in the natural toupee on his cranium. In this assessment the characters are not from same species but may be seen from different. It is only for explanation the species example is used. That means a pathogen can defeat a human, and a human can kill a pathogen depending upon who wields the respective survival tool better.

If these arguments are acceptable, every life form must be looking for a space of its own to spend the time it has. If not, it will be restless and aggressive and even call off life being not interested. Guarding a territory till end comes from this intrinsic birth acquisition of “I want” the right to my survival space. In spite of all these compelling urges, humans do not know much about the concept of territorial instinct and how it affects their lives. It requires deep and prolonged study.

There were serious studies on territorial instincts of living things including humans. Author Robert Ardrey in his book *The Territorial Imperative* proposed the notion of human territorial aggression.³ According to Ardrey, human territorial instincts matched well with the animal instincts⁴ of containing themselves within a territory.⁵ The book describes the evolutionarily determined instinct among humans towards territoriality and its implications in human meta-phenomena such as property ownership and nation building. There were also opposite views. Opposition to an idea is a prime and acceptable requirement for knowledge generation and knowledge development in a human system. But, why do humans insist on boundary lines or borders is still a question? Is it about legality of ownership? Or is it deep-rooted psychological urge? In that case why did Emperor Qin construct the Great Wall of China with such cost, time, effort, ruthlessness and cruelty towards workers? Was it to keep himself engaged from a monotonous lifestyle of luxury? If it was security of the territory, how could it be breached effortlessly by subsequent invaders? It would have happened even if the wall was not there. So, what makes an emperor's mind to perceive the idea of a contained and walled space? Perhaps he would have consulted the good old dragonfly in his esoteric and immense gardens on how to construct a boundary barrier and maintain it without actually building it. The United States today may pick a point or so from the dragonfly to block the crazy

³Ardrey, R. (1966). *The territorial imperative: a personal inquiry into the animal origins of property and nations*. Athenium.

⁴The terms life forms, animals, humans and sapiens are used basically to highlight the underlying protagonist—the human being in this book. The author prefers to consider a human different from all other life forms and presently as sapiens.

⁵Livingston, S. (1999). “Meanwhile: Does Territoriality Drive Human Aggression?” <https://www.nytimes.com/1999/04/14/opinion/IHT-meanwhile-does-territoriality-drive-human-aggression.html>. Accessed 23 April 2020.

Mexicans⁶ from sneaking into the territory of the good old neighbour instead of hooting for a wall along the tenth longest (3141 km) national borders of the world. Why does a computer insist on a firewall or a protective wall of some kind? Why do the earlier mentioned dragonflies circle around a spatial point creating an imaginary wall like an aeroplane awaiting permission to land from the air traffic control (ATC)? One can ask a lot of questions that seek justification for the need for borders that are not only physical but also non-physical in a world that will have to manage lives attuned to self-containment.

Territorial instinct should be the result of the interplay of survival emotions in humans acquired through the process of evolution. Territorial behaviour is the result of territorial instinct which in turn originates from the believed to be geno-biomic territorial imperative. Animals, or group of animals, protect their territories from outside incursions. They normally don't construct walls. They mark their territorial boundaries by their means such as sounds, scents or sheer aggressive presence. Why does a dog always pee on a vertical that too as high as it can? Is it to claim ownership, leave a message or both? The author calls it canine graffiti of territorial claim. It says, "Hey buddy, I was here". Does this mean the psychology of graffiti is establishing presence, a deviated form of territorial instinct?

A question that disturbed the author for a very long time was that, if all life forms adamantly follow the territorial instinct as a universal rule of life, then why is it not visible among plants⁷ and others that are not animals, but another form of life? The answer seems to be on the locomotion as well as social nature of animals. Animals move locationally, and being dynamic can reach out to others, who without a declared territory cannot claim safe area and guard themselves. Besides, a non-social animal doesn't strictly need exclusive territory. The non-social animals move into any place and vacate when the real owner comes or when the need is over. Of course, this is not seriously researched for this study. The reader may consult experts. Another question is, "Are the humans similar to them, or are there humans similar?" It can't be. What about the itinerants, destitutes and their varieties? Ever noticed that static singleton living in the public park in a metro? Yes, they too need territory though they may not own them. The destitute, itinerants and panhandlers too stake claim of territories without legally owning them—on the river bank, under the bridge, over the footpath... That's where the commons come to survival advantage.⁸ Government authorities will realise the difficulties when they attempt to evict them from their spatial holdings that do not legally belong to them.

It seems permanent borders are exclusive to human settlements that serve as identified territories—the sapien land. For the rest of the animal world, it is a

⁶ A term fondly used by a good friend from Mexican Navy, Edwardo Zuniga, who used the term frequently in good spirit.

⁷ Plants also move but differently: photomorphically following light, gravitationally with falling root, ballingly in a desert, as seeds in wind and water, etc. Every living system is dynamic in one way or another.

⁸ Applicable even to animals like the penguins in Antarctica.

perceptive concept for a specific activity, like mating or laying eggs, conditioned by territorial instincts. Otherwise, they have no requirement for a border to define their habitats (seriously). This statement may sound silly. Most of the facts of life are ridiculous that way. There were no permanently defined borders in the beginning even for the humans. They stretched and contracted as power shifted, sometimes fast and sometimes slow. There were human societies conglomerated in pockets within vast areas that remained generally without borders. Ancient and mediaeval India was an example of such a borderless society. The borders were porous. People entered and left at will.

A geophysical territory needs a border. This border needs protection. Today, the sovereign right of a nation is enveloped by its borders. The sovereign right is the base element of national power along with other supporting elements. Open borders invited everybody—from knowledge people to marauding invaders. Human systems flourished and vanished into oblivion giving way to new systems. Not all borders were accessible at will or porous. Some had natural restrictions. Others defined their borders and constructed huge protective walls or fences along them so that no one could walk or ride through. These walls and fences also served as elevated positions to watch over and also to defend against an incursion from outside. They kept the people contained within them without allowing blending with the world outside. They were, in a real sense, projections of their feeling of geophysical insecurity,⁹ which no more exists in its original form as an element. Slowly, and as if in a rhythm of its own dissonant pace in history, nation states formed as visible today within exclusive borders. It was to happen.

Those with open borders developed into societies of diverse cultures. Centuries later, the accumulated cultural diversities lead them to live together as the people of nations with defined boundaries. Some of them got away and created new worlds by migration. Those with closed and protected borders retained their individual culture. Irrespective of closed or open border societies, everybody benefited in their distinct way of life, because human life was never viewed in a rear-view mirror—it was always forward looking. Humans moved forward, and, finally, when the nation states formed, borders started getting defined as determined by limited wars and treaties. But the changes still continue in smaller measures. The world wars, colonial breakdowns, the Cold War and various other situational binges redesigned the border alignments of nations one after another. According to biomodelling from the past, the borders of nation states are still in a rickety flux like the tectonic plates on which life on the planet is dancing precariously. The profiles change frequently. In the post-world war scenario, borders started contracting within the already existing boundaries by settling down to their natural state of affordable nation states. Smaller and smaller nation states formed within larger states by geographical

⁹Gantzer, H & Gantzer, C. “2000 Years of a Wall and Its Warriors”. *Swagat*, December 2000, p. 45. The Great Wall of China was not only built to ensure physical security lone but also the ethnic identity of the Chinese.

micronisation.¹⁰ The last big redrawing of national borders was when the Soviet Union micronised on 25 December 1991.¹¹ It was followed by large-scale disorientation in various parts of the world causing micronisation of nation states. The changes that occurred after the Cold War were similar to that at the end of a world war; it was global. Whether the nation states in the world have reached a point of non-fragmentation or not is unimportant. The existing borders of the world are likely to remain the way they are in the future, mostly. There may be small changes, unless there is Soviet scale micronisation in the offing, though the probability is minimal in a precariously balanced world. Predicting the future of nations has to be under extreme caution.

The border became a strictly land-based concept for a long period of time in human psyche. For the psyche, the border is a line. The border over the sea in the maritime terrain became a reality for the first time by the international acceptance of the United Nations Convention on the Law of the Sea (UNCLOS) in 1982. In spite of such acceptance, the land terrain character of the concept of borders reflects predominantly in every affair of border security management even in developed nations while taking executive decisions.

It is an irony that physical borders divide not only nations but also people. Some of them are divided even within the families in many countries. India, Pakistan, Israel, Palestine and the Koreas can be quoted as immediate examples. There are nations where people are divided internally as if they are in separate nations with differences in their style of governance. In this case hostility, hate and fear divide the people. Many of the African nations face both problems: flawed borders and internal separation. Another interesting point in border management is the case of stateless people, those who are not confined to a nation or an enclosed border area. Their lives and identities are entrapped in a limbo. In addition, there are the “people interrupted” along borders under violent disputes. Millions live on the edge and within the fissures along disputed borders in the world.

The study of borders and border security is not complete without mentioning about such people. Primarily they could be the harbingers of a new world that may emerge years from now: the global commune. A hypothetical look at the current global commune shows a limited population. The people who serve the United Nations come first in it. Though citizens of different nations, they primarily serve by the principles of global security. They are different from the representatives of various nations in the global body. Virtually, they are international citizens. Other members of such global community are those who work in parts of the world on

¹⁰The term micronisation is used to drive home the point that the process of a nation state disintegrating into its naturally available system of land area is likely to occur and can be seen if observed carefully, wherein a state may breakdown to its natural balanced state in course of time. This process is called micronisation of nations in this book. In case a nation expands by merger or integration with another, it could be macronisation of nations. That change is quite unlikely except in very rare cases. Micronisation and macronisation are under natural process and not by the use of force or coercion in any form. In the future world, the chances of micronisation of nations are more.

¹¹Encyclopaedia Britannica, Ultimate Reference Suite, 2004, CD-ROM.

humanitarian missions and other activities to bring the world together or reach out to the needy across the borders.¹² Many of them are volunteers. And the third, of course, are the *Les Misérables*—the stateless and interrupted people of the world.¹³ Their hopelessness will reduce only when global situation of internationalism improves, unless the United Nations takes special care of them. Perhaps it is too early to make a statement. In the meantime this study appropriates the lemma that in the present-day and the future world there can't be a person who is stateless.

Borders in many countries are under dispute today. It may take considerable time and effort to resolve the issues related to them. The effect of border security, however, does not change with such disputes since disputes are one of the many issues in border security governance. The border security policy has to be exclusive. Resolution of a border dispute does not guarantee border security. It is a different issue altogether. Therefore, it is for the government to have two distinct policies: one for the border that is not under dispute and another for the one that is disputed. Also the policy has to be terrain specific and in some cases issue specific. Cross-border infiltration of transnational criminals and militants is a matter of great concern for governments since such permeation can seriously threaten border security. It is equally applicable in the maritime zones where border concept broadens out to an area and not restricted to a line on ground.

¹²French Médecins sans Frontières (MSF) (doctors without borders) is one such international humanitarian group. They provide medical care to victims of political violence or natural disasters, as well as to those who lack access to such treatment. The group received the Nobel Prize for Peace in 1999. Ten French physicians who were dissatisfied with the neutrality of the Red Cross founded the MSF in 1971. They believed they had the right to intervene wherever they saw a need for their assistance, rather than waiting for an invitation from the government. They also felt they could speak out about injustice, even though it might offend the host government. In 1972, the MSF conducted its first major relief effort, helping victims of an earthquake in Nicaragua. They offered their services to the victims of fighting in Lebanon (1976), Afghanistan (1979) and the Russian Republic of Chechnya (1995). During the 1980s and 1990s they worked to relieve famine, offered medical care to casualties of war and dealt with the problem of refugees in such African countries as Somalia, Ethiopia, Sudan, Sierra Leone, Burundi, Rwanda, Kenya and Zaire (now the Democratic Republic of the Congo). Although by the late 1990s a quarter of those serving in MSF were French, there are volunteers from other countries too. Headquartered in Brussels, Belgium, the organisation has offices in 18 countries. In addition to providing medical assistance, the MSF has a reputation as a highly politicised group. There are also non-governmental agencies and organisations especially environmentalists who like to declare themselves as environment warriors but are declared unwanted intruders in certain countries depending upon their policy matters. Border security has to take care of these issues when dealing with people without borders.

¹³Encyclopaedia Britannica, Ultimate Reference Suite, 2004, CD-ROM. It is interesting to note that the areas in which stateless people lived are those pockets along the borders of two states where neither law prevailed. An example is the border between England and Scotland in the 15th and 16th centuries. In this border, neither the English law nor the Scottish law prevailed. Such borders are famous for historic ballads celebrating the adventures of folk heroes who were actually involved in the raids, feuds, seductions and elopements on the border. Though a few deal with events of historical importance, most are concerned with the personal retributions of the outlaws and robber clans who maintained their own grim code on the border. Such borders can facilitate the flow of transnational organised crimes.

12.2 Border Security: Setting

The long introduction was basically on the concept of borders as perceived by humans who actually own the planet itself and not fragmented sections of it. The explanations were based on the human perception of land.

Border is a geographical terrain limitation in national security governance. In the national physical dimension, a border applies to geographical terrains—land, sea and air. Protecting borders to keep the integrity of a nation is the purpose of border security. The important aspect is to defend the border under national and international order. It is a mammoth task. Most of the nations in the world have geophysical border disputes with their neighbours. There are no signs of them getting resolved in the future. Therefore, border security has its biggest challenge—protecting national interests within the borders especially where they are perpetually in suspended animation. The security of the nation including that of its borders is a dynamic issue. It needs to be resolved by identifying threats with respect to a particular country. These threats are not common and so are the perceptions. That is why the best solution is to resolve them bilaterally with or without mediation as circumstances permit. To that extent mediation is best limited to getting people to sit across the tables and engage in dialogues for conflict resolution. The people who sit there have a major task to perform under risk since they represent the people of both the nations and are accountable for their actions. That is another reason why the third party has to move out when they sit across the table. The third party has no such liability even though it may have its own interests.

Border security involves all activities to prevent access to people or materials that pose a threat to the nation in the geophysical terrains. This requires monitoring, control, surveillance and response (MCSR) of the entire stretch of borders and border areas in four geophysical terrains by various means. The concept of border has to be understood to introduce this aspect. Breach in border security—illegal immigration, refugees, terrorist attacks, trafficking, military skirmishes, etc.—unsettles public confidence in the government in addition to the damages done by the intruders. To that extent, today, there is no nation in the world with foolproof border protection system. It is proven. The terrorist attacks in the United States in 2001 were the world's worst ever deceptive strike against the innocence of humanity. It is only second to the American nuclear bombings of civilians in Hiroshima and Nagasaki at the end of World War II in the quantum of shock and awe projected in the media and retained in the archives of terror projection. The frightening aspect of this attack was the prospect that the next one could be worse. It can be seen clearly in the attempt to read the psyche of the perpetrators and their progenies of the future. Such attacks and border breach raise concerns over a nation's capability to protect its borders. The question, the people may ask, will be how these people enter their country and what can be done to prevent it from happening again. The worst, the borders of a nation can be breached from within! The answer is yet to be found. It is more important to understand the border security phenomena not from what is seen or known, but what is unseen and unknown to the public and the nation. The silent intrusion and breach

in border security is a more serious threat to national security. Many nations are victims of border breach.

A border is a geophysical demarcation over land, air or sea expected to be legal under domestic and international laws. It is a political boundary. In that sense, it is not just a line that “divides” two nations, but a demarcation of physical assets owned by each nation and within which the limits of jurisdiction under the state’s laws are defined. Normally a nation will have a single boundary unless it is distributed in different parts. There are split nations on the mainland separated by land terrain, like the Sultanate of Oman; over the land separated by the sea, like Malaysia; with islands separated from the mainland, like India; on the mainland with provincial boundaries like China with Hong Kong, Tibet and Macau; overseas territories like France and Reunion Islands; leased territories like the United States and Guantanamo Bay in Cuba. . . It is interesting how nation states are distributed in this manner. Such nations may have multi-aspect boundaries instead of a single boundary. Another interesting aspect of borders is that it may be appropriate to consider them in plural taking each terrain border as separate since they have certain amount of abstractionist differentiation. While the land terrains have unidimensional borders, the air space has a dual-dimensional border with length and height and the sea having the most complicated of them all: area rather than a line, depth and the seabed planes—the ground under. Therefore, for the purpose of border security, the demarcation is to be seen in the multidimensional context of the border concept.

Borders will be sensitive when they are disputed, and there is geopolitical incompatibility between nations across them. This incompatibility can have geostrategic impacts, which may make the borders sensitive threat attractors. The geostrategic threat will come from transnational criminal activities (Crimes³⁺), cross-border terrorism, environmental and economic aspects, demographic situations, etc., across borders. There are a host of problems for which the governments have to find solutions.

12.3 Border Security Policy

Border security of a nation is embedded within the national policy on border governance, if such a policy exists. Most of the nations do not have a definite policy in border security, especially when riddled with disputes over border issues. Often it is fragmented and not managed in a professional manner. Multi-terrain borders and far too many governmental agencies or none at all with accountability with a definite border management policy is a bad situation. A mixed and uncertain policy, with too many governmental agencies and forces that have no coordination coupled with multi-governmental control, against neighbours with definite policy of infiltration make the situation worse. Worst is when the government entrusts the border security just to the armed forces in different pockets without proper guidance in policy matters. Further superlatives on the incongruence of border management in a system

that is not sure of itself are limited by language. If a topological¹⁴ stretching out of extreme superlatives is permitted, then it could be seen in border management through blunders of diplomacy, war gain mismanagement, political decadence and sheer inability of the system of governance to manage the issues. In most of the border management policies, the armed forces and other security agencies lack guidance on what the government wants them to do and how it expects them to do it. The policies change frequently, and that makes the job even more difficult. Managing the border security policy is a serious matter, and it needs a firm government under firm convictions. It will also depend on the size of the country and its threat perception. To preclude the complexification of border security issues, the management policy may assimilate all the stakeholders involved in border security issues within a transparent regime that will include:

- (a) A unified organisational policy setup (central and state governments).
- (b) Identified military forces (army, navy and air forces and their variations like strategic force command, marines or paramilitary forces under the respective military forces)
- (c) Other identified central armed forces (non-military: border guards, coast guard, etc.).
- (d) Identified state armed forces. State (or provincial) armed forces are non-military in most of the cases, though in certain countries they do have a serious role in defence. These forces employed for border security do not have to be from the states on the international border alone. It could be from any other state. Such deployment has definite advantages, though not highlighted here. Suggestion to use a state armed force for a central purpose outside the state may be a new one though central forces are frequently used for state purpose.
- (e) Other enforcement agencies (customs, immigration, police, narcotics control, fisheries, border guards, forest rangers, mercantile marine, sea port authorities, airport authorities, etc.).
- (f) Intelligence agencies (central and state).
- (g) Executive authorities.
- (h) Private stakeholders in border security—business organisations, farmers, etc.
- (i) Social workers.
- (j) National disaster management agencies.
- (k) National environmental agencies.
- (l) Border people representatives.
- (m) Legislative authorities.
- (n) Judicial authorities.
- (o) National research and development organisations.

¹⁴Topology is a mathematical field that deals with deformed dimensions. It is an offshoot of geometry. Deformation in geometry takes place by stretching, squeezing, bending, twisting, etc. Applications of topology in a social model or, to that extent, in a non-mathematical model will be an interesting study.

- (p) Information management cell including media representatives.
- (q) Census and recording agencies.

The border security policy should be lucid and definite with thorough understanding of the threat that is clear and present with futuristic appreciation. The policy has to be designed based on threat perception. An effective policy is a crucial decision and one of the expensive national security proposals. Developed nations are capable of spending big money on securing the borders, making them “smart”. Smart borders will have advanced facilities for MCSR besides entry check and verification systems. The policy features should promote greater cooperation among border management agencies and increased awareness about the people and materials entering and leaving the country. Border security policy will include:

- (a) Border details—land, sea and air space
- (b) Foreign policy related to each border including memorandums of understanding, bilateral agreements, etc.
- (c) Threat perception under each category
- (d) MCSR protocol
- (e) Border policy stakeholder regime
- (f) Lead intelligence agency for a specific border with interface definition
- (g) Information sharing interface
- (h) Response contingency plans
- (i) Related legislation
- (j) Coordination centres and plans for integrated response

Under no circumstances the border security should be misinterpreted as matters of military security. The subject of border security relates to national security under non-military threats, whereas military security as a whole should cater for military-border security with a clear definition of interface in the activity profile. Border security does not include military offensives across the border. It comes under military security that may include attacks, surgical strikes, pre-emptive strikes, etc. While military security is also concerned about borders during high-intensity conflict situations, intelligence is part of both military and non-military aspects of border security at all times.

Policy actions that can be taken in border security include policy declarations. Border declarations between the countries sharing common border will include action plans jointly agreed by both the parties for transforming a border policy for a particular border. In such cases the border policies of the state parties will have to be common. The declaration will normally contain control of movement of people and goods, preventing smuggling and trafficking, securing infrastructure, coordinating and sharing information in order to meet the objectives of border security. The declaration will also involve air space and aviation safety, environmental aspects, refugee asylum process coordination and also fisheries and piracy control if the border declarations are about sea areas. These are nation specific, and points relate to the issues faced by each nation across its border. For example, terrorism and militant activities are common issues. Under such circumstances a border declaration

between two countries is to be supported by smart MCSR systems. In the normal case, a border declaration is applicable to countries that have friendly and very cordial relations. It is not easy otherwise especially between countries that use the borders for state-sponsored subversive and insurgent activities or transnational criminal activities. Border security, therefore, has to be seen under the geostrategic perspective. Other issues are alien smuggling, free trade agreement flow, interdiction of contraband and confidence building measures (CBM).

Legislation is important in enhancing border security without which the policy will not have the desired validity. The legislation should relate to all aspects of access control that can prevent terrorist and illegal infiltration by reforming immigration laws. It should help the security agencies to coordinate with foreign intelligence services to seek information for access control by integrating the exit and entry data system on a global security alert under current and developing scenario of national security. Biometric identifiers like digitally recorded passports and other particulars in immigration documents, machine-readable visas and passports and arrival-departure and security databases are vital for access control. Biometric particulars are also vital for screening visa and admissions of applicants.

Intelligence sharing is significant in immigration law enforcement. Legislation will bring the agencies that have important information together with those who need it. Such information sharing will be essential where there is a need to prohibit admission of an alien from a country designated to be a state sponsor of terrorism until appropriate clearances are conducted on such an individual. Bureaucratic conflicts can jeopardise even the strongest of policy decisions. The causes of such conflicts are many: changes in government, individual decisions of the powerful, national and international pressures, dual control within the government, etc. Border policies should be sans bureaucratic conflicts.

Borders—particularly national borders—affect travel and migration. People can usually move freely within their own country's borders, but may not be allowed to cross into a neighbouring country. Borders can also be open, closed to keep the people in, defended or disputed, sometimes violently.

12.4 Types of Borders

A border separates or demarcates geographical areas. They are political boundaries between nations in national security studies. Besides nations, borders separate smaller geographical units such as states, provinces, prefectures, villages, cities, towns and other geographical entities. The purpose is governance. The governing authority creates and enforces law within a particular border area. Borders change over time through legal or violent annexation, agreements and so on. Sometimes, borders fall along natural boundaries.

To sum up, borders limit the terrain as a system boundary of purpose. Every identified terrain has a border in the study of national security. The limiting boundaries can be classified as:

- (a) **Geographical** borders that are related to geographical terrains—land, sea and air space.
- (b) **Non-geographical** borders are of those associated with the governance of outer space (contiguous and deep), cyber, genome and biome. These borders, except for cyber, are future perspective in the global scenario.

The borders over the eight terrains can also be classified as:

- (a) **Geophysical** borders over land, sea, air space and contiguous space.
- (b) **Non-geophysical** borders comprising the four non-geophysical terrains—deep space, cyber, genome and biome.

Each type of classification of borders has different strategic purpose. It helps in grouping the terrain apropos the strategic perception. For example, in military security, especially in the future, it may be convenient to group the four geophysical terrains collectively along with any of the identified non-geophysical terrains, such as cyber security or genomic security. Cyber security aspects come in security considerations related to unauthorised entry into the national cyber systems.

Border security primarily relates to breaches to the borders in geographical terrains, which are land, sea and air. These are the identifiable borders between nations. They are borders recognised under international law. The concept of borders for other terrains is entirely different and is yet to be introduced definitively in strategic studies. One of the reasons could be that their terrain specificity itself is an evolving factor.

According to international understanding, there are different types of geographical borders: full international border, disputed de facto border, territorial claim border, ceasefire line, undefined boundary, international administrative boundary, etc. Many nations have claims on overseas territories around the world as early as the fourteenth century. These territories too form part of the states' concern and have boundaries that need to be protected by the claimant nations. The status of overseas territories and dependencies fall under various categories: external territory, dependency, overseas department, territorial collectivity, autonomous, associated territory, dependent territory, crown colony, crown dependency, unincorporated territory, administered territory, commonwealth territory, etc.¹⁵

On the ground, geographical borders are based on the concept of geoproperty rights. There is no habitable land left in the world that does not belong to someone or some government. Governmental claims are even on uninhabitable lands. The world is divided within these claims wrapped in borders. The sovereign states have apportioned practically all the land in the world among themselves within defined, in some cases, arguable, boundaries. This also includes the air space above and a small belt of maritime borders. Antarctica is an exception.

The ocean is different. The high seas beyond the maritime zones remain exclusively for the common good. In general, there is no land that is free from the

¹⁵DK. (2003). *Essential atlas of the world*. Dorling Kindersley Limited. pp. 156-59.

jurisdiction of individuals or government. It is a case of *territorium nullius*.¹⁶ Determining a given frontier of a territory whose title has been vested in a state based on the principles of sovereignty, recognition, consent and good faith under international law is not easy objectively. Relative significance of historical, geographical, strategic, ethnical or economic considerations under international law is not only abstract in measurement but also a variable of sorts. However, this task is done under overt power politics or power politics in disguise—not strictly covert.¹⁷ This is an important aspect of frontier limitation and acceptable ipso facto for the same purpose. Identifying borders falls under these criteria of facts.

The various borders that are geographical are briefly examined further.

12.4.1 Land Borders

Land is the ultimate terrain for humans, the promised one. It is natural that the concept of borders is primarily founded over land. As explained before, borders originated from land, based on the psycho-physiological basis of the territorial instinct inherent in humans. There are borders for everything in life over the land—a house, a commune, a farmland, a productive area and finally a nation. Even imaginary stories are built around mishaps in the neighbourhood creating an invisible border around human mind by conditioning it, so that people do not venture out and may remain within their territories. The ghost stories and paranormals are at times border oriented—don't enter or walk through this territory guarded by the supernatural entity. Epics and mythological stories are full of such frontiers. The concepts of borders have made people neuro-psychotic building castles in the unknown terrain. The border defined space and privacy of the inhabitants. Without borders, a nation cannot be defined. And borders invariably happened over the land. Walls, fences and lines, visible and invisible, are crisscrossing over the planet; they define the humans and other entities within them. But the sea and air spaces were treated differently. While the coastline became the border initially for the sea-land interface, the air space was left to the birds till humans took to flying seriously. Now, interestingly, they chase the birds off their flight path to avoid a hit, not to save them, but their own dear souls.

Breach in borders has been all prevalent. It is a serious matter. The land borders can be breached more easily than other borders. Unlike other terrains, the humans can move at will negotiating the land terrain. Humans have an uncanny ability by instinct for traversing the land irrespective of terrain peculiarities. Even in the most hostile land terrain, people feel psychologically safe. It is not so even in knee-deep water at sea. Humans face resistance of nature by instinct in geographical terrains

¹⁶Schwarzenberger, G. (2000). *A Manual of international law*. Universal Law Publishing Company. p. 121.

¹⁷Ibid, p. 126.

other than land. There are people who miss a beat even in the first class cabin of an airplane, lounging probably on the most expensive seat in the world when it shudders in an air pocket. It is because of the comfort people feel over the land that make them breach its borders more frequently than at sea or air that calls for specialised platforms that are liveable and mobile.

The land borders are unique in their diversity. They are the only geographical borders in the form of demarcated boundary lines on ground. The terrains could be glaciers, ice, deserts, forests, mountain ranges, ranns, marsh lands, swamps, urban conglomerations, rural villages, land-sea interface, fields, grasslands, mangrove deltas, steppes, lakes, rivers, well, etc. The diversity can be amazing, and the problems of a country for protecting them can be accordingly complicated. It will be strictly a nation-specific issue based on its topography and geostrategic location. The basic principle in settling a river border interface is dividing it at the centre throughout the length of the river shared by two countries. These borders can be vacillating depending upon the changing pattern of the river. Disputes may arise from such changes. There are many nations with common river boundaries in the world. It is important to understand that the perception of land borders generally terminated at the coastline when boundary was decided on the sea front. It is not really so if the concept of border is seen from the angle of sovereignty. Though not depicted exactly to that extent, Article 2 of the United Nations Convention on the Law of the Sea (1982) states that the sovereignty of a state extends (beyond its land territory) to the territorial sea, the air space over it and the seabed and subsoil under it. The land border, today, literally should extend beyond the coastline up to the territorial sea limits of the country with the perimeter of the territorial sea becoming the borderline. This is the extent the federal laws are admissible as on the mainland, though the customs, fiscal, immigration and sanitary laws may extend to the contiguous zone.¹⁸ The internal waters of a state, irrespective of their width, are the waters within the baseline on the landward side of the baseline of the territorial sea.¹⁹ The inland waters are part of the land territory along with other waters inside the state. So, the land claims a bit of sea and the maritime ones.

The countries with the most land borders are given in Table 12.1.²⁰ The likelihood of increase in the number of land borders is more since the trend is to break up rather than to accede for a unified nation or join together as a union of nations. Union of nations are a matter of convenience unless such unions stand the test of time.

Protecting the borders is a major issue for governments. The longest land border is 8893 km long between the United States and Canada. Table 12.2 gives top 10 borders according to length.

¹⁸ Article 33, UNCLOS.

¹⁹ Article 8, UNCLOS.

²⁰ There is no specific reason to take most land borders are with eight or more neighbours. But examined further later while examining is the length of land boundary or the number of neighbours that matter in border security. Or do they matter after all?

Table 12.1 Countries with most land neighbours (eight or more) (2020)

Country	Land neighbours	Neighbouring countries
China	16	Afghanistan, Bhutan, Hong Kong, India, Kazakhstan, North Korea, Kyrgyzstan, Laos, Macau, Mongolia, Myanmar (Burma), Nepal, Pakistan, Russian Federation, Tajikistan, Vietnam
Russian Federation	14	Azerbaijan, Belarus, China, Estonia, Finland, Georgia, Kazakhstan, Latvia, Lithuania, Magnolia, North Korea, Norway, Poland, Ukraine
Brazil	10	Argentina, Bolivia, Colombia, French Guiana, Guyana, Paraguay, Peru, Suriname, Uruguay, Venezuela
Democratic Republic of Congo	9	Angola, Burundi, Central African Republic, Republic of the Congo, Rwanda, Sudan, Tanzania, Uganda, Zambia
Germany	9	Austria, Belgium, Czech Republic, Denmark, France, Luxembourg, the Netherlands, Poland, Switzerland
Austria	8	Czech Republic, Germany, Hungary, Italy, Liechtenstein, Slovakia, Slovenia, Switzerland
France	8	Andorra, Belgium, Germany, Italy, Luxembourg, Monaco, Spain, Switzerland
Serbia	8	Bosnia and Herzegovina, Bulgaria, Croatia, Hungary, Kosovo, Macedonia, Montenegro, Romania
Turkey	8	Armenia, Azerbaijan, Bulgaria, Georgia, Greece, Iran, Iraq, Syria
Zambia	8	Angola, Botswana, Democratic Republic of the Congo, Malawi, Mozambique, Namibia, Tanzania and Zimbabwe

Table 12.2 Top 10 long land borders (2020) (The length of the borders will not be exact. In case of doubt, the government of the countries shown is the final authority on information sharing about the borders.)

1. Canada-United States	8893 km
2. Russia-Kazakhstan	6846 km
3. Argentina-Chile	5300 km
4. Mongolia-China	4677 km
5. India-Bangladesh	4053 km
6. Russia-China	3645 km
7. Russia-Mongolia	3543 km
8. Brazil-Bolivia	3400 km
9. China-India	3380 km
10. United States-Mexico	3141 km

The problems at the border need not be based on its length or the neighbourhood numbers. There could be issues even for short borders and lesser neighbourhood. But it is a fact every nation will have a neighbour across the border, some of them across the ocean. Underlying factors in border governance may include the following:

- (1) Unresolved disputes at the border
- (2) Military engagements in the past across borders and the chances of happening in the future
- (3) Transnational crime movements across the border, especially the dominant Crimes³
- (4) Global terrorist activities
- (5) People-to-people relationship
- (6) Demographic movements, temporary and permanent, in search of greener pastures
- (7) Border activities of livelihood
- (8) Close border movements and other activities
- (9) Cross-border activities

The governments may engage in various activities to ensure border stability. This will involve the following:

- (1) Bilateral agreements between neighbours for the good order and discipline along the border
- (2) Establishing rule of law across borders
- (3) Participating in the joint efforts to contain unlawful activities
- (4) Cross-border confidence building measures among military and other border forces
- (5) Observant internal security governance for rule of law
- (6) Compatible trade agreements
- (7) Immigration control under strict laws
- (8) Balancing economics on both sides in adjacent areas

There are inland border points that act as entry and exit terminals for a country. Inland borders are within the external borders as an extension. International air and seaports, inland container terminals, etc. are common entry and exit points located in the interior, not at the outer border of a country. There will be inland spaceports in the future. Protecting these borders in detail is a difficult process, especially in the absence of firm policies. It incurs cost and requires thorough cost-benefit analysis (CBA).

12.4.2 Maritime Borders

Perhaps a casual reader of history may not have noticed it seriously, but a strategist cannot discount the fact that it was mostly those who came by the sea colonised and exploited the human systems they discovered. Those who came over land either withdrew after the initial conquest or stayed on integrating with the locals or dividing

their original harmony. Both ways new normal²¹ and order were created in the systems transforming them seriously. Human system is dynamic; hence an activity in its dynamics can be first taken as a natural process that will happen anyway as a resultant of the conflicts. That is how an intelligent and dynamic system goes through the inevitable evolution. Most of the nations did not take the sea seriously and considered it a security moat from foreign invasion, but it proved otherwise. Those who dared the oceans conquered the coastal states and established their will. Time changed the aggressive patterns. In 1982, people of the world decided to share the sea as a common good and demarcate the rights for exploitation and passage according to territorial attributes. For the first time, though invisible, lines were drawn on water with the drafting of UNCLOS for all who adopted it to follow. According to the then secretary general of the United Nations, Javier Perez De Cuellar (1920–2020), with the signing of the UNCLOS, “the International Law was irrevocably transformed”.²² Undoubtedly it was a remarkable work in international law that will go a long way in sharing the wealth of the oceans judiciously and settling maritime disputes once for all. It took quarter of a century to arrive at the Final Draft.²³

The difference between the borders at sea and over land is that while the border over land is a line of demarcation, the maritime borders are designated areas (zones) indicating the extension of sovereign rights and property rights with peripheral separation. The borders thereby become areas or zones from the conventional lines over the land.

The borders at sea thereby become the maritime zones, each with its own peculiarities and legal applications. UNCLOS defines the maritime zones from the baseline. A state’s boundaries lie in these waters. For the purpose of such demarcation, the baseline is the reference point. It is defined in UNCLOS. The normal baseline is considered to be the low-water line marked on a large-scale chart.²⁴ The low-water line is also known as the low tide line (LTL).

Accordingly, the territorial sea applies to all the laws related to the land. The *territorial sea* extends not more than 12 nautical miles from the baseline. The sovereignty of a state extends to its territorial sea.²⁵ It extends to the waters, seabed and the subsoil underlying and the air space over such waters. Protection of its territorial waters is the sovereign right of the nation. Territorial waters permit

²¹ New normal, originally, is a term in business studies that refers to financial conditions following the financial crisis of 2007–2008 and the aftermath of the 2008–2012 global recession. The term has since been used in a variety of other contexts to imply that something which was previously abnormal has become commonplace. New Normal (business). Wikipedia. [https://en.wikipedia.org/wiki/New_Normal_\(business\)](https://en.wikipedia.org/wiki/New_Normal_(business)). Accessed 20 April 2020. In this study the term applies to governance and is used in conjunction with the transformation in the world order which is in singular as well as plural.

²² UN. (1983). *The Law of the Sea*. United Nations. p. xxix.

²³ The First Law of the Sea Conference was in 1958.

²⁴ Article 5, UNCLOS.

²⁵ Maximum limit, Article 3, UNCLOS.

innocent passage to foreign ships except warships including submarine and other underwater vehicles that will need to notify their passage to the concerned state. Innocent passage means passage that is not prejudicial to peace, good order, discipline and security of the state.

The *contiguous zone*²⁶ is further to the territorial waters by another 12 nautical miles. Its limit is 24 nautical miles from the baseline. The state may exercise powers and take such measures related to its security, immigration, sanitation, customs and other fiscal matters by notification. It is a buffer zone from border security point since immigration and customs laws are applicable in this zone. From the seaward it should be treated as the entry point boundary for border security though freedom of navigation exists in the contiguous zone outside the territorial waters.

The *continental shelf*²⁷ is primary to the maritime area. It occupies most of the zones. It comprises the seabed and the subsoil of the submarine areas that extend beyond the limits of the territorial waters throughout the natural propagation of its land territory to the outer edge of the continental margin or to a distance of 200 nautical miles from the baseline where the outer edge of the continental margin does not extend to that distance. The sovereign rights are for the purpose of exploration, exploitation, conservation and management of all resources; exclusive rights and jurisdiction for the construction, maintenance or operation of artificial islands, offshore terminals, installations and other structures and devices as necessary for the exploration and exploitation of the resources of the continental shelf for the convenience of shipping or for any other purpose; exclusive jurisdiction to authorise, regulate and control scientific research; and exclusive jurisdiction to preserve and protect marine environment and to prevent and control marine pollution. The national government may declare any area of the continental shelf and its superjacent waters to be a designated area and make provision with respect to the activities therein that may include management of resources, safety and protection, environmental security and customs and other fiscal matters.

The *exclusive economic zone (EEZ)*,²⁸ is an area beyond and adjacent to the territorial waters, and the limit of such zone is 200 nautical miles from the baseline. The rights of a state are as applicable to the continental shelf and such other rights as recognised by international law. The state may declare any area of the EEZ a designated area or make provisions for its exploitation, safety and protection, environment and customs and fiscal matters. The concerned national laws can be extended to the EEZ by notification. In the EEZ and the air space over it, ships and aircraft of all states shall subject to the exercise of the coastal state of its rights within the zone and enjoy freedom of navigation and over flight. Basically the rights of a coastal state in the EEZ are over the resources in the water column and the seabed and under.

²⁶ Article 33, UNCLOS.

²⁷ Article 76, UNCLOS.

²⁸ Article 55, UNCLOS.

In addition, a state may declare certain waters as *historic waters*²⁹ and specify the limits adjacent to its land territory. The sovereignty of the state shall extend, to these waters, the seabed and subsoil underlying and the air space over such waters. The historic waters thus declared will be the internal waters of it. Therefore, it may be included as the land border, though, in water from the border security point of view.

The maritime zones call for demarcating the maritime boundaries between a state and its maritime neighbours. The maritime boundaries between two countries shall not extend beyond the line every point of which is equidistant from the nearest point from which the breadth of the territorial waters of the states is measured. The maritime boundary is to be seen as an area within a perimeter. For a maritime nation, these boundaries and the maritime zones within are vital for its border security in the emerging scenario.

It is the responsibility of a country to delineate the outer limits of its continental shelf at the foot of slope (FOS) and the 2500 m isobath³⁰. Thereafter, its claim for the legal continental shelf (LCS) can be submitted to the United Nations in accordance with the UNCLOS regime along with the geophysical data to substantiate the claim. In the legal continental shelf, the country will have jurisdiction only on the seabed and the subsoil below. For that matter, it is not an EEZ, but could be termed, if so desired, as an extended seabed area (ESA). In the LCS or the ESA, the provisions of the high seas govern the activities on the surface and above and in the water column.

At sea, the concept of border is about areas rather than lines. The border area needs to be guarded against insidious threats. It needs specific marine capabilities. The maritime zones are open areas of varying sensitivity. The demarcation is only in cartographic records. Besides, the sea-coastal interface, the coastal zone, often referred to as border, is a complex terrain. The task is to destroy the threat before it reaches the target—the shoreline. The domain to tackle the threat is the maritime zone. If it fails, the asymmetry advantage for the coastal state in the maritime domain reverses multifold. The domain of maritime zones includes inland waters, archipelagic waters, territorial waters, contiguous zone, exclusive economic zone and continental shelf or the ESA as a general all-inclusive domain. It is for the concerned maritime nation to define these accordingly within the international laws. Each of the elements of the total maritime zone of a nation has its own distinctive features and judicial implications. The property or resource rights of a nation can extend further and away from its maritime zones. For example, a nation could have rights for mining in seabed away from its natural zones as in deep seabed mining. The same concept could extend one day to a faraway planet or a satellite like the moon. In all aspects of maritime jurisdiction, it is important to understand that the high seas are

²⁹Paleri, P. (2004). *Role of the coast guard in the maritime security of India*. Knowledge World, p. 113.

³⁰Isobath is an imaginary line or a line on a map or chart that connects all points having the same depth below a water surface (as of an ocean, sea, or lake).

the interlinking chain of oceans, which lie to seaward of the territorial sea.³¹ Often this is misunderstood for waters beyond the EEZ.

12.4.3 Air Space Borders

Air space is the atmosphere that belongs to a nation and regulated by it. It is the upright and the third dimensional portion of the atmosphere, above a country. It spreads out all over the world without a barrier. The air space is an exclusive terrain.

The air space above a nation can be compared with the subsoil under national territories. This is a rule under international customary law. Air space boundaries are treated as appurtenance of land territory including the territorial sea that is recommended to be treated as land boundary. Air space is synonymous with atmospheric space. Breach of air space occurs during war, intelligence gathering in other-than-war situations, transnational criminal activities, militant activism and accidental diversion. Terrorist attacks, hijacks and other illegal adventures fall in this part besides illegal entry of the unmanned aerial vehicles (UAV) in a nation's air space.

Air space will be further subdivided into a variety of areas and zones, as deemed required by the government for the purpose of governance. The sovereign extent of air space is a bit vague. There is no international agreement. There are working benchmarks as it becomes a kind of global commons practice to fly above these limits until they are firmly established. There is a 100-km boundary benchmark which is used for separating national air space vertical from the commons of aerospace as of now. It is called the Kármán line. This is important for legal and regulatory measures as aircraft and spacecraft fall under different jurisdictions and are subject to different treaties. This is not recognised by all. It also means there is no international law defining the edge of space and therefore the limit of national air space. It is not felt a pressing need at this point of time.

12.4.4 Outer Space Borders

Outer space lies beyond the air space. It is generally known as space which in this study on national security and governance is divided into contiguous space and deep space under terrain specificity without giving a distance measure from the outer limit of air space. The contiguous space is taken as part of the outer space that humans occupy in their space activities except for deep probing which extends to deep space. It is important to note that in this study the separation of contiguous space from deep

³¹Schwarzenberger, G. (2000). *A manual of international law*. Universal Law Publishing Company. p. 133.

space is a varying extension that will be based on the activity profile of the world space agencies and collective governments. But the border is taken as the interfacial line between air space and contiguous space for explanation in this section.

Space is a global commons, meaning it is not part of a nation's claim as a property. Matters of space are governed under space law, which encompasses all the agreements, rule and principles in and between nations as amended. Space law governs matters related to space sciences, exploration, governance, weaponisation and use of weapons, arms control, liabilities for damage, rescue efforts, earth monitoring and surveillance, intellectual property application, environment, information sharing, technology applications, criminal law, commercial law interplanetary expeditions, privatisation, insurance, ethics and a host of other things. The space culture and governance get updated frequently because it is a fast-developing terrain application in global and national governance on the planet earth.

The border begins at the interfacial surface of the earth's atmosphere which is the outer surface of the demarcated air space. The border doesn't extend vertical to this surface into the outer space for obvious reasons. Nations as well as the global community should be concerned about the violation of this border by other nations into one's own nation as well as near earth objects (NEO) heading on collision course with earth (see chapter on disaster security). Currently there are no borders defined for national limits in outer space. The probability of such a border in the future is doubtful, but certainly the sovereignty of a nation is expected to extend to the platforms that may be sent to outer space in course of time by various space-faring nations.

12.5 Border Security Intervention

According to the author, the critical aspect of border dynamics in decision-making for border security intervention is the fact that a border belongs to the people living on both sides of it. They can claim the area on their side (Box 12.1). Border is mostly a shared geoproperty that cannot be cut open to separate the countries as in the surgical separation of Siamese twins. Notwithstanding the line principle, border can also be a shared point between more than two nations. For example, a tripoint, trijunction, *triple* point or *tri-border* area is a geographical point at which the *boundaries* of three countries or subnational entities meet. There are many tripoint countries. The point may meet over the land or the sea. Similarly a quadripoint is the junction that is shared by four countries. An example is Botswana, Namibia, Zambia and Zimbabwe that meet at the eastern end of the Caprivi Strip in Africa. Like the borderline, the point border too belongs to all who share it.

Box 12.1 Who Owns a Border?

A border could be a line or a point (even on water. Who says lines cannot be drawn on water?). The people on the sides of the border jointly own the border. They don't strictly share breaking it. Breaking border invites conflict. It is not similar to breaking bread that metaphorically affirms friendship. The entire border belongs to the people who are spatially divided by it according to this study. Therefore, border security is a joint activity. The complexity in governance of border security will become more intense if considered otherwise. Border can be used as an excellent medium for confidence building between those who own it if not treated as conflict provocateurs. Mutual respect is the term presently in vogue in geostrategy for border governance. Border security is to be governed subject to national as well as international laws.³²

Border security intervention involves serious MCSR activity backed by actionable intelligence, data recording and information sharing systems. The systems designed to cater for border security implementation should be capable of managing a domain that is complex, vulnerable and exceedingly politicised besides the bikini line for crimes sans borders, politics and religion, especially Crimes3. There are many issues a government will have to tackle in border security intervention. The governance scenario, irrespective of the country or a government, will be replete with the following:

- Stability issues along the border—disputed, definite, teeming, isolated, etc.
- Terrain-specific problems—land, sea and air³³
- Nature, characteristics, charter and quality of border forces and agencies
- Diversity of problems related to the border in different time spans
- Dimensions and intensities of threats
- Changing geostrategic perceptions across the border
- Perceptions and aspirations of the people:
 - Close to the border
 - Internal to the nation

The perceptions and aspirations of the people close to the border on either side or internal to the nation may be diverse but are crucial in taking decisions on border issues. For a government, managing the borders means also managing the psyche of the people with a difference, even in a case where the terrain is not habitable. An example is the part of Siachen Glacier in India. The people in a faraway thickly

³²There will be differences in this statement with respect to terrain specificity. Accordingly the borders will be as per the agreements between those who share them. For decisions of ownership on borders, the land border is ideal as a standard.

³³Every nation will face the three terrains as even the land-locked nations have a marine element that influences it. This faction makes it eligible for exploitation of ocean.

populated coastal state of Kerala, India, will have their own views about it that will reflect in their opinion. The government has to understand it. Border security management is for maximising national security. People are common stakeholders in border decisions irrespective of their location in a country. These matters have to be studied separately under the cost-benefit analysis for a decision. Due allowance should be given to managing the element of informational security to allow people to have their right to information on matters related to border security.

The trauma of the people living close to the borders is normally sunk in the deeper issues of the problem faced by the states concerned. Among the human-made borders in the world, there are many that are resolute. They serve as borders of the impeached souls. There are intentional and unintentional intruders across borders. Often it is the latter that gets caught and languish for years in jail. The intentional intruder is trained to evade. Life changes for the “intruder” once caught. The border between India and Pakistan is one such trap zone. Those who stray across also include the armed forces’ personnel who are on patrol or just doing their duty near the border. In some cases where it is not marked by a pillar or fence on the damned terra firma, they may stray into it by wrong sense of direction. They get caught and vanish even from the memories of others and languish anonymously for years in a distant dungeon in the captors’ country—all in the name of justice in society.

A simple biomodel can be placed as an example though infinite ways borders were breached since the beginning of human habitats. The Pakistani armed forces captured an Indian army soldier in 1999. He strayed across the border accidentally. After languishing in a Pakistani prison for 5 years, he found freedom when released in 2004. His unit did not know about his capture. He was ignominiously declared a deserter of the Indian Army. He was not a prisoner of war (POW). The Pakistani authorities were kind enough to give him his life back, but on his return, he found his wife was already married to another person. She was pregnant. Through the village justice, he got his wife back.³⁴ The army understood the mistake and reinstated him in his job. While the life squared with him in all probability, it was the woman, her second husband and the unborn child who remained as the impeached souls of border casualty. It is a poignant story deep rooted in the trauma of life that none of the affected could ever decipher. The second husband of the girl lost his wife and his unborn child. It was the decision of the *Panchayat*³⁵—social justice of a kind. Justice often cannot compensate the loss but certainly is the only way a human society can care for the unfortunate in a tragic situation.

In another story, a fisherman from Karnataka, India, was reunited with his mother after 21 years. He was presumed to be lost at sea in 1982, whereas in reality he was pining away in a Pakistani jail for trespassing into their waters. It was a tale of ordeal. He was allegedly subjected to regular torture by Pakistani officials throughout the period. According to his version, the Pakistan Coast Guards caught him. He was a

³⁴Raju, S. “Panchayat Reunites Arif, Wife”. *Hindustan Times*, New Delhi. 20 September 2004, p. 15.

³⁵The village commune that has special power under the Constitution of India.

mechanic in a fishing boat. There were 14 others from other states along with him in the boat. Their boat was confiscated. Many mothers will not be that lucky to find their children presumed dead knocking at the door years after.³⁶ These stories talk about the human sufferings around the borders, and perhaps the governments may have to give a serious thought on impeached souls while deciding on border security management seriously. It has to be incorporated in geostrategic security matters through bilateral understanding with human concern. Under disputed situations, borders become death traps for the human psyche. The governments have to understand this point while dealing with the problems, and politics have no place in it in a civilised society. Such stories abound the borders in various parts of the world and not specific to India alone. The United Nations has a more serious role to play here.

The protocol on border security needs to be prepared with respect to each border to analyse the issues carefully and thoroughly taking these factors into consideration. A standard checklist will include:

- Neighbourhood analysis: relationship with the neighbour and the geostrategic parameters
- Length of the boundary line and terrain
- Common boundary line, coastal and perimeter length, terrain and zone area in case of a maritime border
- Current method of surveillance and its efficacy
- Threat perception and trend: current and future
- Issues: bilateral and international
- Built-in value analysis and value engineering for CBA
- Confidence building measures (CBM) to regulate incidents across border
- Human perception

Cross-border problems and issues vary with respect to time. In the olden days, if they were marauding invaders, religious propagandists searching for people to convert, knowledge seekers, traders, thieves, refugees and travellers who crossed the borders of a country to enter, today the scenario is different. The identified problems and issues at the borders are:

- Infiltration
- Encroachment
- Sharing the encroached land by the party with a common neighbour
- Militant and religious activism
- Internally supported infiltration for political and other gains
- Cross-border terrorism
- Health hazards

³⁶“Presumed Dead, Son Returns Home after 21 Years in Pak Prison”. *Hindustan Times*, New Delhi. 7 July 2003, p. 11. Here it may be seen that the term Pakistani Coast Guard could be a misnomer since the Pakistani equivalent of a coast guard, the Maritime Security Agency, was created much later. In all probability, the fisherman would have been apprehended by a Pakistan naval patrol boat.

- Environmental hazards including disaster cascades across border
- Firing across border
- Espionage—sea-, land- and air-based intrusions
- Piracy
- Fisheries law violation
- Smuggling: consumer and intermediate goods
- Protection of vital installations and areas along or close to the border
- Protecting vital facilities in the sea border areas
- Arms trafficking
- Human trafficking
- Drug trafficking
- Poaching: resources and environmental
- Dumping ballast water containing alien organisms
- Illegal goods entry including hazardous and toxic materials
- Dumping toxic and radioactive materials
- Commission of crimes like murder, dacoity, theft, robbery, etc. by criminals
- Passport forgery
- Money laundering across border
- Rogue intrusion by armed forces
- Illegal enclaves and inhabitants
- Planned changing of demographic profile of border areas
- Militant sanctuaries and training centres
- Kidnapping and tax collection by rogue groups
- Spill-out effect of ethnic conflicts
- Insurgency
- Cross-border disaster situations
- Cross-border health issues including pandemics and bioterrorism

The problems across borders are far too many, and each border will have its specific problems. Therefore, border management, though holistic, has to be specific with the primary issues of the particular border in extremely hostile terrains and situations. Borders are invariably volatile besides being hostile because the psyche of the border people can vacillate on duality of fence sitters who prefers to jump to the better side.

The equipment for a border management system cannot be identified in a theoretical manner. It will depend upon many operational parameters and assessed for value under expert analysis with respect to cost. A general border MCS inventory will comprise among others:

- Night-vision devices (NVD)
- Handheld thermal imager
- Mobile surveillance vehicle (MSV)—also called stalker
- Battlefield surveillance radar (BFSR)
- Long-range recce and observation system
- Unattended ground sensors
- Low-level video surveillance

- Low-level thermal surveillance
- Noise-level imagery
- Spotter scopes
- Direction finders
- High-power telescopes
- UAV
- Underwater cameras
- Remotely operated vehicles (ROV)
- Unmanned underwater vehicles (UUV)
- Forward-looking infrared radars (FLIR)
- Shore sensors
- Over the horizon radars
- Vessel monitoring systems (VMS)
- Satellite imagery
- Automatic identification systems (AIS)
- Biometric identification systems (BIS)

Protecting the border system is by physical and electronic means besides instruments of geostrategic security management. These include:

- Declarations
- Border fencing
- Joint patrols
- Aerial surveillance
- Maritime surveillance
- Perimeter surveillance
- Area surveillance
- Intelligence coordination
- Entry point checks
- Exit point checks
- Intermediate point checks
- Immigration and customs checks
- Biometric records and checks at exit and entry points
- Specific (terrain and area) forces for border security
- Community watch groups
- Psychological operations
- Information tactics

Financial and human implications of border operations are high. The primary objective, therefore, is to prevent escalation of cost. The enemy, identified or unidentified, will indulge in increasing the cost to the adversary. In border management, the enemy is just another entity from whom threats can be anticipated at all times. There are also threats to border from other entities mentioned earlier. Sometimes that could be worse and unexpected, such as a flash flood or a forest fire. There could be implied mass invitation for cross-border residents into a neighbouring pocket for political or religious reasons. Under constant threat of an identified

enemy, a government may overlook these issues. The enemy may also take advantage of these issues. One of the objectives of the enemy is to increase the border management cost of its adversary. This the enemy will do well with or without the support of its geostrategic connections. Here is where the border management machinery has to exercise extreme caution.

Border security is linked with various terms in vogue. "Homeland security" is a term in use in the US post-terrorist attacks of 2001. For some others, it is internal security; some call it interior security. Generally it means entry restriction to people at the checkpoint. Border security means all these and more. The topic deals with every issue related to the concept of national security and not just physical security from aliens alone. Border protection from internal security matters needs to be seen through the systems eyes as the capability to deter infiltrations, immigration and attacks across the border. The system on the ground comprises patrol roads, barbed wire fencing, buffer zones in conflict areas, anti-tank trenches, electronic fence, monitoring and observation posts for sterile zone surveillance and interception, surveillance systems and physical obstacles. It should be a total area control system with comprehensive network coverage and C⁴IS systems under a netcentric operational management structure to avoid friendly conflict casualties especially where multi-agencies or units are involved. The system should be capable for terrain-specific border and perimeter defence in all time and weather conditions. The system should provide defence against ground, low aerial and coastal intrusions by detecting, locating and targeting terrorists, smugglers, illegal immigrants and other threats across the border. It should be capable of integrating all the equipment into a surveillance suite that can be employed on airborne, aerostat and mobile platforms including UAVs. The sensor array should include pre-emptive detection sensors, passive unattended sensors, intruder detection systems, observation systems, command and control systems, aerostat systems, ground surveillance radars and coastal defence radars. Absolute integration of the entire protection system including personnel with the systems is a necessity. Otherwise, in a non-integrated mode, the entire systems' architecture will be a highly wasteful expenditure. Undoubtedly this calls for high-quality expertise in managing a border protection system.

It is often misunderstood that the issues of border security could always be bilateral between neighbours. It need not be so. It is a myth under the principles of border security. The threat to the border could come from anywhere. For example, an illegal stowaway from far-distant country could be a threat to the border of the United States. The illegal immigrant does not have to come from the neighbouring Mexico. Any nation can face a threat to its border from anywhere in the world, like the oil fire fallout from Iraq surfaces as an environmental threat in Kerala, India. For Iraq, the pre-emptive strike by the United States and its coalition against the Saddam Hussein regime in 2003 was a long-distance threat across its border. In this attack, there was even an unprecedented (though the United States denies it) disconnect between the United Nations and the concerned aggressors in the post-World War II scenario. Such doctrines are built on two pillars: first the aggressor will do everything in its power to maintain its unquestioned military superiority and supremacy,

and second the aggressor arrogates the fight to pre-emptive action.³⁷ These principles support two classes of sovereignty and related actions that often flows across borders: (1) the individual aggressor's sovereignty that takes precedence over international treaties and (2) obligations and the sovereignty of all other countries. It is similar to the writings of the British author George Orwell (1903–1950) in his famous work *Animal Farm*—all animals are equal, but some animals are more equal than others. Double speak is the order when values are contradicted. In such cases, international relations are believed to be relations of power. Legality and legitimacy are mere decorations. Here the aspect that is stressed is military power. But no empire has ever been held together by military power alone. The idea that might is right cannot be held within the idea of open society. Hence, the need for Orwellian double-speak. Such countries are ruled by dictators. They do not tolerate dissent. The gap between reality and its false interpretation will become so big that the bubble has to burst. Such countries believe in market fundamentalism and military supremacy. Such doctrines need clear enemy. Terrorism provides the ideal enemy, but it is invisible and at the same time never disappears. The principle of border security gets into a different mode here. The security at the border will depend upon the government in power in that country and its vision and policy—more so on its geostrategy. Does it mean that a dictatorship in a country is a long-distance threat to its own border? If so will that threat come from another dictator in disguise? Is dictatorship a necessity when the threat to a country's border is unprecedented and counter measures do not have the time to go through the normal bureaucratic decision-making process including customary conflicts within? All these make the element of border security a complex but highly actionable element. There are indirect border crossings that may form a threat. An example of indirect crossing is that of a container shipper. Containers that land in a country are cross-border transportation of multimodal cargo. The containers can be used for smuggling³⁸ and trafficking for economic and militant reasons. Bioterror in the form of a biological agent can come by ordinary or casual means. Vigilance at the time of stuffing containers at the container terminals, on passage including illegal transfers at sea and at the entry point are direct methods. Having ports classified under international security instructions is another method. Anything that moves across borders can have a threat element in it. Bioterror in the form of anthrax or any suitable biological agent can come by ordinary mail. There are no foolproof methods to stop direct or indirect cross-border infiltration. Support of intelligence machinery is essential for effectiveness in observing effective MCS at the borders.

12.6 Border Disputes and Confidence Building

Many nations fight continuously across their borders without understanding the reality on ground. Most of these terrains are rugged and difficult (that is one of the reasons why the border disputes linger on) both over land and ocean. There are advantages too; the capabilities in such terrains for conflict and enforcement will improve. Profitability or other benefits for a nation by hostile train dispute engagement in the long run is debatable. There is no other way, but to leave such inhospitable terrains over imaginary disputes related to nationhood. Forced line of control (LOC) between countries is a natural gift to them to settle disputes once for all and protect the border from both sides from third-party interests. This is another point which border dispute decision-makers have to understand. There can be a different party interest in an undisputed border which in turn makes it disputed beyond the sovereign owners. The third party could be a nation or a human system and its political offshoots.

There will be beneficiaries external to both the governments in the settlement of a problem along or at the point of a border. These beneficiaries will stand to greater advantage than the nations that are parties to the dispute. A conventional area-specific war was one of the incidents that invited a solution in the past with a settlement under third-party mediation. Politics and fundamentalism breed on such issues in a world where one does not have faith in another. The reason is the binary bipolarity, the natural balancing force of the human system presently. Being natural the disputes are not abnormal. They are issues for resolution. But a treatise on national security cannot be paper full of recommendations and suggestions. It has to be a clean canvas for decision-makers on governance to paint. National security is a practical subject, and everything associated with it is forward looking for human well-being. And it will be done, if the governments and its decision-makers and executioners can intervene with confidence. Border security matters are like any other threat that a nation can face and handle in the betterment of the state parties as opportunities in a win-win situation. The first step towards it is to freeze the dispute to the point of origin in time and identify the stake holders of the period and handle it accordingly with hardened will, preparing for messy confrontations with third parties other than the common people involved. “Stop-freeze-identify-resolve” is the guiding principle that the two parties involved can jointly examine under the prudent rules in border dispute management to avoid loss that could be mutual. Any perceived gain otherwise over the other will be illusory with effects that will be short lasting. States are powerful entities. The bottom line is that border disputes can be resolved only in a win-win situation eliminating post-issue stakeholders. In certain cases, it will be a long wait, though. The secret is in the confidence building measures.

History shows that sometimes wars may resolve the border problem causing fewer damages than that of a partition or prolonged proxy wars. The damage in a war could be minimum and short living in comparison with the prolonged issues that

may follow proxy wars and militant activities.³⁹ Disputes on border matters will ultimately settle down one day, and when it happens, it is desired to be with minimum damage (including the presumed loss of face) to the parties involved. The important aspect is that a third party should not be the beneficiary. Most of the confidence measures are political attempts internal to a nation's governance or externally under geostrategic compulsions.

The idea of border security takes interesting turns when nations try to introduce confidence in the other. Often it imitates the road show patterns in a publicity campaign. Each nation tries to see that the other does not consider it naive and take advantage. No nation blindly believes another. Besides, officials who participate are not generally free to make decisions. These limitations bind down even the most dynamic negotiator. Freedom is the essence of negotiation. The ideal negotiator is the person who is the ultimate authority in making a decision on the subject of negotiation. Everything on earth is negotiable, that is, the dictum, except all that a negotiator is externally curtailed to negotiate, that is, the colliding dictum. The resultant dictum is that nothing is negotiable in the absence of freedom to negotiate and power to execute. Without authority to take decisions on both sides, no negotiation will be fruitful. Even agreements are not followed subsequent to signing them. The absence of decentralisation in a negotiating situation permits third parties to take advantage of the situations in a geostrategic context. Often this is termed as failure of diplomacy. Actually the cause is executive failure under political compulsions.

Another problem in border dispute resolutions is the introduction of personality factor. Seldom one can gain advantage in resolving an issue based on personalities

³⁹ Grant, N.B. "Border Security". Letter to the Editor. *The Times of India*, Mumbai. 2 May 2001, p. 12. According to the author of the letter, a retired Brigadier of the Indian Army, at least 10 to 15 security personnel are killed daily along the border of India in Jammu and Kashmir, the North East and along Bangladesh border. He attributes the porosity of the borders to the handling by paramilitary organisations that are controlled by non-military command and control. Other reasons, he quotes, are improper demarcation of the borders, lack of intelligence, etc. The responsibility of protecting India's borders is fixed on the military and other armed forces. In such a scenario, he argues that there is total lack of coordination at the borders. He advocates a single integrated command for border security under the military. This was just one of the opinions expressed by the analysts in India. There will be plenty of solutions for just one problem. But in border security, like in most of the cases, the question is simple, "Will this solution make the situation better for the people?" Even if the answer is "yes", one cannot rush to its implementation unless one is sure to identify the solution that is best and give maximum benefit to people of the nations involved. Thereafter even the method of its implementation has to be chosen taking the same parameter into consideration. Such issues cannot be dealt by "wham bam—media and politico savvy" attitude especially once the "governments have missed the bus". There are many solutions articulated well by individuals, organisations and the governments to the problems at the border. But where "one lacks information" is not in the solutions, but the problems themselves. They are not well articulated. The symptoms are taken for the problems. Indo-Pak problems could worsen once the dispute on their border is resolved by any of the current formulas. Both the countries may have to wait to identify the best solution. It is not that they have missed the bus, but it crashed in the valley. The time for the appropriate solution to spring up can be induced. That is what those interested have to work out.

alone; always it is based on creating win-win situations that both parties are in a hurry to grab. The win-win situation can also be external to the issue. Personality contribution is limited once negotiation starts. The plan of negotiation with multiple solutions in a changing scenario is the secret in a national security-related negotiation. Here the plan and alternatives are more important than acting them out by chosen players. The script is vital. It may not be so in a corporate negotiation. First, the negotiator has more freedom. Second, the choice is unlimited compared to a national security negotiation. Thirdly, the time factor in corporate negotiation is to the advantage of both the parties, whereas in national security situation, advance in time mostly affects discussions adversely.

The problem that a country may face may be in formulating a policy on the other country on border security. The governments can flip-flop consistently.⁴⁰ Countries can be accused of repeating mistakes and not bothering to take their people into confidence or to explain why policy has been reduced to the level of personalities, their likes and dislikes, personal whims and fancies and above all vested interests.⁴¹ The question here is how does the other country view the problem? It has to be more or less the same way. Lack of confidence and domination of the personality cult rules the situation. There are also the affected people. Hence, the idea of border security in a disputed situation lies on leaders, people and confidence within the system. None of these are worth exploring since history has shown that disputes cannot be resolved by pegging on these three entities. It has to be government to government that includes both the leaders and the people or the confidence between a government and its people. Confidence building is only an ideology that sells under. No major relief has ever been obtained by confidence building efforts for the money's worth in history. Where was the confidence building during Cold War? At the end one lost and the other won. Under the polarity theory, it is temporary, and the other can catch up or rather should catch up to maintain balance.

Confidence building is not an inordinate or inconsistent subject that has no meaning. It has to be merged with geostrategic security and modified for creating situation to resolve an issue that exists, and not for containing the issue, which is only attacking the symptoms, not curing the disease. Symptom treatment may provide temporary relief, though. And to think of it, not only elections but also leading awards and prizes could be won on the success of symptom treatments in a world where memory is short and invariance prevails.

⁴⁰Mustafa, S. "When Personality Mars Policy". *The Asian Age*, New Delhi. 30 September 2004, p. 13.

⁴¹Ibid.

12.7 So, What Is Border Security?

Border security, in this study, is the fourth identified element of national security in the chronological hierarchy of 16 elements. Border security, “bordersec” in short with the symbol “ b_s ”, is a complex issue for many nations over land, sea and air as the border jointly belongs to all those who share it and hence to be secured jointly to safeguard national and international interests.

In the overall appreciation, borders define nations in the physical sense. The national borders today are based on historical facts and evidence among responsible nations. It is framed under mutual understanding and goodwill. Nations are expected to resolve outstanding boundary issues through diplomatic dialogues or international legal systems. No nation can accept artificial enlargement of territorial claims by another unilaterally.

There are border disputes over land and ocean all over the world. Disputes over air space will be the overflow from the land and maritime disputes. No continent is free of border dispute between countries. None of the disputes are likely to be resolved easily as it is hard to overcome the original inertia. This makes border dispute management one of the key issues of border security.

Besides unresolved disputes, there are problems of illegal immigration, cross-border transnational crimes, border movement monitoring and enforcement of various regulations even in recognised borders. In the system approach of a nation, as a governable and independent geopolitical entity, there will be a system boundary, which will be defined as the border firmly perceived by the people, legally or otherwise, that could be mutually acceptable or disputed. The factors associated with border security governance include physical protection, trade and travel, environmental sustainability, confidence building measures, disaster management, suppression of unlawful activities such as Crimes³⁺, illegal immigration, smuggling, subversion, espionage, piracy and armed robbery, pandemic containment, etc. Border security involves border control by MCSR. Border security reflects in national security affairs in all the geophysical terrains where situational domain awareness is the key for decision-making whether land, ocean, or air.

The author doesn't believe that border disputes are permanent. They can be resolved. Behind every border dispute resolution, there will be the tacit understanding that the border belongs to the other(s) too. An interesting example is that of Andorra (Box 12.2).

Box 12.2 The Andorra Story: Two-Sum Game Model in Border Dispute

The story of Andorra is interesting. It is a small principality situated on the border of Spain and France in the Pyrenees mountains. It is a co-principality of the Bishop of Urgell (Spain) and the French President. Both countries claimed it since 803AD. And it was only in 1993; a thousand plus years later, the

(continued)

Box 12.2 (continued)

countries reached an agreement and gave Andorra an independent constitution and near-autonomy status. It retains the co-princess as heads of state, but executive power now rests in the head of the government. The co-princess does not have the veto power, but are represented in Andorra, which also has no currency of its own and uses that of its neighbours. Andorra joined the United Nations as a member state in 1993 and is a recognised parliamentary democracy. This is a case where both the contestants, Spain and France, lost the province in an international “meddle”. This is another example of how time relieves both the parties in a dispute—a two-sum game theory model where both the players lose the prize to a third, sometimes, invisible “player”. (The loss in resolving the dispute is more than the dispute itself for both the original players!) Autonomy normally leaves out defence and finance. A principality is equivalent to a nation and gets formally absorbed with the membership in the United Nations. Andorra is not a solution, but a surgical separation of the problem! One doesn’t amputate a finger just because a nail clipper is not found. Of course, neither a nail clipper has a place, nor a disputed territory is equivalent to a finger in geostrategy. The contestants have to understand the psychology of border disputes and how both may lose the pie ultimately. However, there is no singular hypothesis in border issue resolution since each problem in the world is to be seen differently different.

12.7.1 Definition: Border Security

Against the background of this study, border security means “the capability of a nation in establishing a border under consensual demarcation of those jointly owning it, where consensual demarcation means demarcation under mutual confidence and consensus ad idem and not by aggressive or any other means that are deceptive or otherwise unlawful, and maintaining its physically and protecting it from all unlawful activities, simultaneously encouraging lawful transactions in accordance with international law and treaties, perfectly aligned with the other elements of national security and integrated with all the terrains of national governance”.

12.8 Summation

Historically, nations were concerned about their physical borders. It is the inherent fear that any living thing or system with territorial instinct will have. Border and border security are two different terms in meaning and application. Every nation is concerned with breach of its borders. It becomes complex when there are disputes. Terminologies associated with border security may vary—internal security, security

of national integrity, motherland security, fatherland security, homeland security, etc. Irrespective of the terminology, the idea is to protect the borders of a nation to prevent a breach of any kind. All relates to the concern about national security. In this book, this concern is presented in an identified element of national security exclusively on borders of any terrain and based on the trend in border management in the world in general.

The case for border security to include as a separate element of national security is more than prominent now, especially in the light of transnational crimes including militancy across the borders. Borders of nations were porous since time immemorial and still continue to be so in the mindset of the people who use them whether over land or the oceans. For most of the countries, border security became important once they became sovereign states. Disputes followed.

Though invasions may not have ended up in colonisation of nations, it was invasions with the purpose of colonisation that became the first major effect in history where border security breach had taken place. It happened to all those human systems in the world whose border security was extremely weak. The powerful crossed the borders and colonised the land they crossed into and exploited it for its resources for many years.

Border management is to ensure border security. Border management in most of the countries is still introductory. It is easy to breach the borders of even the most powerful country in the world as situations prove. The reason for the ease at which a country's borders can be breached is very simple—the world is not designed for humans to divide them by imaginary lines. It is against the natural process and design. If in doubt, go out into space. One may not be able to read the earth like the way one see the map on the wall or the study table in a conference room. Each state may have its own concerns, and the common element is access entry to unwanted personnel and goods. It is a vast issue, and every state is involved in protecting its borders constantly. The cost of these efforts is very high, and the strategy, therefore, depends on minimising cost and maximising security. It can only be arrived at by expert analysis and policy decisions.

As long as the nation state systems are the prevailing forms of organised human systems, there will be boundaries between them, clear or disputed. Therefore, serious international cooperation, in addition to bilateral cooperation, is required to maintain border security especially under the emerging scenario where a nation's borders can be breached by people elsewhere and not just by the neighbour alone. This could happen even without the knowledge of the neighbour. These and other matters are to be viewed seriously in geostrategic security matters. Being a cooperative member of the international community, every party should ideally support a country's concern on its border breaches in clear perspective in international forums and especially in the United Nations, which can be a vital link in border settlements and other security issues.

Many of the borders between nations are disputed, and solutions are not easy to come by. Most of these disputes are historical or issue based subsequent to wars between nations. It could be resolved only by dialogues that will have political angles since the initiators are not free for independent decisions. These dialogues

will be of mutual benefit, though sustaining resolutions between two players can only come out in a win-win environment. The rest will be coercive and short lasting. That is another reason a third party cannot be invited into a dialogue even as a facilitator unless such an initiative can induce the much-needed win-win prospective into the dialogue. It is hard to come by because of third-party interests. Border disputes, therefore, will continue as untreated issues for a long time in a nation's history. They may resolve at the appropriate time under extraneous circumstances that is not easy to predict under the current circumstances. Mostly such issues will be resolved in third-party interests that could be a nation or a set of people. The original issues that lead to the dispute may take a back seat in the course of time. The United Nations can be a great healer in certain cases. One such example is the resolution of the border dispute between Cameroon and Nigeria that has been settled by the World Court and the United Nations in 2004. The settlement hailed as peace for Bakassi was a credit to the international community under the United Nation's flag. The dispute was 90 years old. But not all the disputes are UN compatible.

As long as there are nation states, there will be borders; and as long as there are borders, they can be breached, how powerful the country may be. Border security issues have to be seen in this manner as a round the clock affair.

One of the painful things that can happen to the people of a country is partition of it under third-party enforcement even though consensual to its leaders. This happened to India in 1947. The trauma is unbearable and gets in to the DNA of the nation and its psyche. The strain continues through generations. The only way is to forget it through resilience, which the author believes, the governments can provide by national security governance. That may wipe out the curse of the Rubicon⁴² (Box 12.3).

Box 12.3 The Curse of the Rubicon and the Border Breaches

The curse of the Rubicon is a term used by the author to appreciate the never-ending issue of human territorial instincts and unsettlements in the human niche syndrome of owning own caves and expanding their borders rather than making the entire planet as a collective settlement for all. The latter should ultimately happen, at least theoretically. But, that is many life years away. In the meantime the curse of the Rubicon stands through border disputes and border breaches. The curse is a paradox originated from survival insecurity. Humans are not using what they have (the planet) but attempting to make more

(continued)

⁴²Crossing the Rubicon is used as a metaphor for a pass into a point of a no return. It originated from the tracing of Julius Caesar's crossing the shallow Rubicon River (in northeastern Italy, today) on 10 January 49 BC that precipitated the Roman Civil War, which ultimately led to him becoming the dictator. A government will cross the Rubicon when it commits itself irrevocably to an action that is risky and uncertain.

Box 12.3 (continued)

of what they don't have (the planet) without knowing what they are attempting to fight for what actually they all hold collectively—the planet.

This statement could be classified as false optimism, or whine of pessimism, or falsifiability of a theory that is true but needs further investigation to prove it. There should be no semantic dissonance here, but there could be misperception which is not exactly the former, but the former can cause it. But there are trends that the curse of the Rubicon is waning, very slowly, though.

Governments should know that no border is free from the curse of the Rubicon, at least for now.

Chapter 13

Demographic Security (Demosec) (d_{s1})

Demographic stress may not snap the human system; but will take away the well-being unless governed critically and sensibly

13.1 Introduction

All modern humans belong to the species *Homo sapiens*. *Homo* is the genus. The sapien human is the only species that are present today in the genus *Homo*. This statement is exclusively for this study, but not reserved. Every life form carries the genetic signature of its past intact. While homo means “human being” and sapien means “wise”, “discerning” or “sensible” in Latin, it could be said that the term *Homo sapiens* indicates wise men or wise people. In fact every human on the planet is expected to be wise, not just a few oldies growing white beards and holding long rods taller than them one may see in movies of the lost genre. But the term sounds a bit archaic if not outrightly incongruous for the study of national security. The term is too old and bespoken umpteen times. It is also scholarly and scientifically correct. But governance needs simple decision recipes that do not have to be reprocessed.

Therefore, at least in the examination of down-to-earth (where else?) demographic security which is about the study of population including the movements and settlements of peoples, it is preferred to consider *Homo sapiens* as just sapiens, the human species of the day. They are (supposed to be) wise, the author believes. It is time to stop selling dummies to dummies, even in the concept of national security. This decision is under the assumption that every human on earth is intellectually oriented for survival with the neurological intellect as the ultimate survival tool of the day. It is present in all of them, though in varied formats. And they have to make their ways in life using intellect with its default systems as the human survival tool available, which is intelligence refined through discrimination or *viveka* as they say in Sanskrit. The demographic story begins here reiterating an old quote by the author: “There is nothing more precious and supportive than a human life in national security”.¹

Though a sapien belongs to the kingdom of Animalia, for this study they are not considered animals. So, a human is a sapien, and sapiens are different from animals in this study, though, say, a beaver may also belong to Animalia in phylum Chordata similar to humans in zoological studies.

The concept of national security is aimed at the entire people of a nation. Their size, density, distribution, profile, mobility pattern and life characteristics are important for identifying the social diversity of a country. Demographic security, as an element of national security, is embedded in this process. The concerns related to demography are far too many. “The larger the population, the more impediments to national security” is the popular conception. The oft-repeated terminology that explains this fear is “population explosion”. But many consider in straight line and instant thinking that population explosion or exponential increase is a way of establishing their will in society. Population does not explode literally. It increases or decreases in the course of time.

Birth of a baby is meant to be a naturally beautiful experience. And, a human baby is a precious delight. There is nothing more beautiful than a child for a human who is a human and will remain humane. But a baby is viewed a curse or a liability when human system turns “individually” insecure. At the same time, they are considered to be an asset when the purpose of baby production is to flood the demographic market to gain control within a niche with a strong whiff of belief. Both beliefs stem from the singular “collective” insecurity of the respective humans and human systems. Therefore child birth can be an expenditure to some individuals or a perceivable revenue to some others and collectives. Both are perceptions and may turn around differently in the long run. Animals do not feel that way. Animals tackle insecurity using survival defaults. The perceptions associated with population growth are always negative. It indicates that insecurity prevails all over. The impact of population on economic development, urban congestion, resource insufficiency, health issues, illegal immigration, human smuggling and trafficking, illiteracy, work

¹Paleri, P. (2008). *National security: imperatives and challenges*. Tata McGraw-Hill Publishing Company Ltd. p. 207.

force demand and supply issues, decline in family welfare, crime and violence, social security concerns, effects of birth control, etc. are always debated. According to contemporary belief system, many such issues are attributed to unregulated population growth. All these together give an impression that population is the cause of everything that is socially egregious. How could that be when the world is meant for people to live and survive? How could that be when those who speak about demographic explosion do not consider themselves as part of it? How could people conclude that others like them have no value? Why could not the world turn it around and see people as productive and intellectual power centres? Perhaps the concept of demographic security resides more in the unintended mindsets and bolted perspectives than in these questions.

It took some time for people to understand the need to record about themselves and their existence in a systemic manner. It was then an Englishman John Graunt (1620–1674), who by profession was a haberdasher, felt working on the subject of people's birth and death. His work "Bills of Mortality" in 1662 examined the weekly records of deaths and baptisms dating back to the end of the sixteenth century. In search of statistical regularities, Graunt made an estimate of the male-female ratios at birth and death-birth ratios of the population in London and rural communities.² He worked on the population statistics. Others followed him in demographic studies. Initially, demographers were involved in emphasising the mortality rates. Fertility reduced in the second half of the nineteenth century in industrialised nations. This extended the attention of demographers in the fertility and reproduction of human population. The phenomenon of differential fertility, with its implications about selection and, more particularly, about the evolution of intelligence, evoked widespread interest as shown in Charles Darwin's (1809–1882) theories and in the works of Francis Galton (1822–1911).³ During the period between the two world wars, demography took on a broader, interdisciplinary character.

13.2 Demographic Security: Setting

Demographic security is about balanced and sustainable survival of human population. Survival depends on life-supporting systems of nature as well as those devised by itself in its scientific and technological pursuit. It is considered that size, composition, changes in their number, etc. affect their economic prosperity, health, education, family structure, crime patterns, language, culture, social systems, etc. This indicates that strictly every aspect of human life is impacted by population trends

²Encyclopaedia Britannica, Ultimate Reference Suite, 2004, CD-ROM. John Graunt was considered the founder of demography.

³Darwin and Galton were British naturalists, explorers and anthropologists. Darwin's theory of evolution on natural selection became the foundation of modern evolutionary studies, whereas Galton's pioneering studies on human intelligence were well acclaimed.

according to the contemporary view. The study of population, started modestly as mentioned before, has reached a level today with the capability to predict the future trend within reasonable accuracy.

Population is an investment instrument with a difference—with its own needs and demands. Demographic security is neither just about the size of human population in a country nor is it counting heads. It is about the use of population science for national security objectives. For that it needs enumeration of the people and the pattern of their movement voluntarily and non-voluntarily. It is also about other attributes: gender, sex, sex ratio, age, composition, habits, belief systems, geographic distribution, etc. In general, it is about strategic investment of humans by capitalising them for governance aimed at their well-being. A country can be a receiver or a supplier of people or both under different expertise and value. The personality of a country will vary accordingly. Some quarters advocate that fears over the economic effects of immigration are much exaggerated.⁴ In such case the human capital⁵ as productive investment mechanism holds valid. It is more so in a world that is much integrated than ever before. Population remains static over ground relative to the world, but its constant flow across the world can upset the stability of nations and their economy. Among the movements of people, human trafficking is the most contemptuous. The underlying principles of trafficking are the sheer powerlessness of the victims arising out of gender and physical disparities and lack of economic choices.

Political affiliation and belief systems of people based on perceived security coupled with dividing discrimination among humans and “the more the people, the less the share of one” economics play truant in demographic security. This appreciation about demographic density leads to the conclusion that population increase is precarious to national security. Demographic changes are continuous. Regular locational movement is an insatiable urge in humans. An advertisement states that if you stand on Time Square in New York, USA, for long enough, you will witness everyone from the entire world passing by. People move from lower potential to higher potential in life’s perennial transit. Such movements can cause demographic imbalance. The flow of people is from the bottom upwards—from the less affluent nation to the more affluent. The world was without boundary in human subconscious since the beginning. The urge is there for those who dare to move. And most of them dare, for different reasons. Will human migrations ever stop? Ideally, the answer could be “yes”. That is when the global situation is conducive to people at every point. It is impossible. Therefore, demographic security as an element of national security will depend upon balancing the human flux for any country. Demography is not just about human movement; it is more. It is a study in human population variation—natural, chancy, forced and determined.

⁴The Economist. (2001). *Making sense of the modern economy*. Profile Books Ltd. p. 23.

⁵Human capital in this study means people who are continuously capitalised for productive activities by effectively investing in activities. See Paleri, P. (2018). *Human investment management: raise the level by capitalising human*. Springer Nature Singapore Pte Ltd.

13.3 Human Population

Human population, according to studies, started expanding approximately 50,000 years ago. This was the time when modern humans started migrating out of Africa, their original place of birth.⁶ By then the Upper Palaeolithic was on.⁷ Since then, the growth was exponential. In 5000 BC the world population became 50 million. In 7000 years it rose to 6.15 billion (2004), most of the time exponentially, and is expected to grow beyond 8 billion in 2025.⁸ The exponential growth of the population is given in Table 13.1.

The growth, though exponential, was not uniform during certain periods, as can be seen in the table, and the trend was to relatively slow down in recent times. The growth has taken a down trend in certain periods.

Over 82% of world population resides in Africa, Asia and Latin America, which is around 4.87 billion as of 2004.⁹ The exponential increase, making to 86% of population is also expected in that part of the world. Most of them will attempt to emigrate to North America and Europe. The flow is from lower gross national product (GNP) countries to higher GNP countries as if it was necessary to balance the world GNP by people movement. The increase in population is in the countries whose per capita GNP is relatively low. Population increase continues in such countries unabated. Whatever, the low GNP nations could legitimately seek the

⁶This is an assumption as the original place of birth can be different for different sets of “original” humans. The original human is the one born first in a specific location. These specific locations are still being studied with new revelations every time.

support of higher GNP nations on the principle of “if not my people will leach into you” principle.

An ideal way to understand the trend will be to see a population in an assumed closed system where there is no in-and-out movement of people—where there is no immigration or emigration. In a closed system, the basic components of population change are birth and death. To that extent the global population is a closed one, but not the population of a country. The people move in and out of a country, legally or illegally. That complicates the system with respect to the national security of the particular nation. The demographic issues are more serious for national security than for the overall global security principles because of this difference. While population growth is *cause célèbre* all over the world, fertility is causal to population. Fertility was considered to be a thing of joy. It was always thought out to be a divine intervention or blessing. Unregulated fertility, therefore, was assumed to be sinful in certain systems. It is acceptable considering that human evolution, even though selective, was based on this viewpoint and the limitations the people had in interpreting a cause-and-effect situation like reproduction with clarity. There is always a gap between potential and realised fertility. This gap is the effect of natural regulatory aspect of fertility until new methods of controlling fertility evolved. The next stage is obviously artificial fertility. It has already crossed the experimental stage. This method can add another variable in the fertility concept and will take it beyond divine intervention with a human intercession added. Already, artificial fertility facilities are available to people. Only the methods of execution and acceptance vary. Humans have an uncanny knack of exploring the difficult and mysterious without thinking about the future. It is by default and perhaps needed for balancing between survival and extinction. This way the human beings may end up as the least endangered species on earth. Only the well-being will be the concern in the existential drag. Hell is the other word for existence for all, but everybody need not admit it. That is why the search for human well-being.

A well-studied high-fertility group is the Hutterites of North America, a religious sect that views fertility regulation sinful and high fertility a blessing.¹⁰ Hutterite women who married between 1921 and 1930 were known to have averaged ten children per woman. Meanwhile, women in much of Europe and North America averaged about two children per woman during the 1970s and 1980s—a number 80% less than that achieved by the Hutterites. Even the highly fertile population of developing countries in Africa, Asia and Latin America produce children at rates far below the Hutterites.¹¹ The problem in certain parts of the world is not just population explosion based on female potency, but terminating the female foetus before birth or killing the newborn female baby. General preference is for male children. From the emperors and smaller kings of the ancient days to the rich and the not so affluent, ensured the children were male. The purpose of a queen was to provide a male heir to the kingdom and nothing more. She could be frivolous,

¹⁰ Encyclopaedia Britannica. Ultimate reference suite. CD-ROM. 2004.

¹¹ Ibid.

imprudent and frolic in wanton luxury, the king couldn't care. Exceptions are limited. There is a subconscious preference to the male child as a security syndrome among humans.¹² Those who advocate against termination of the female embryo as well as regulating fertilisation speak on behalf of their faith-based preferences rather than population well-being. Whether this aspect is by default in the human system to balance the population (only a woman can give birth syndrome; hence less women, less birth) or a serious sign of the turbulence of mind that does not grow with its owner and environment is not known. In the first case, if accepted for this study that female foeticide could be a normal human reaction based on perceived security to regulate population under more than necessary fertility potential of an average women, the only danger is in deleting the sin factor of the act. Because once the sin factor is eliminated, the act will not be regulated. That will cause a problem on the reverse. Again, the fallout of this theory is that population is not a curse, but a conditional boon, if balanced at the global level. The nations may either cross the limit of optimum population or may remain under. It is not easy to average. Secondly, does nature take care of the world from crossing the threshold? It is not known. Though not clearly known, this study hypothetically believes human population will get naturally balanced by default.

The general message from such evidence is clear enough: in much of the world, human fertility is considerably lower than the biological potential. It is strongly constrained by cultural regulations, especially those concerning marriage and sexuality, and by conscious efforts on the part of married couples to limit their childbearing. There are socially determined behavioural differences in marriage patterns, childbearing and child development. It is a normal trend that fertility declines in developed societies. Some of the reductions are remarkably rapid. Decline and rise of population theories associated with fertility are matters of serious debate but always eluded a satisfactory explanation. People's views are varied from copulation to population. There is a general belief system that population is the root cause of all problems. Lately this feeling is changing. From the point of view of national security, population cannot be seen as a serious problem because the concept is meant for finding the well-being of people. This is the basic ideology of national security. It is not only meant for the people who are there today but also those who will be there tomorrow. This includes all those who are going to come. In this hypothesis, barring natural selection process, no artificial selection process is involved.

The argument on the problems of population is on resource sharing. It includes all food, jobs, land, etc. Ideally, resources can dwindle by sharing, but by replenishment the resources can be made available for all. That is what is happening. The reason for population increase is the code of life itself. Without high fertility and ability to

¹²Gusai, Y. "If It is a Girl the Affluent Prefer Abortion". *The Asian Age*, New Delhi. 12 September 2005, p. 13. According to reports, in India even the rich prefer to abort the female foetus. Selective abortions are common in India. According to a doctor, there is a severe demographic imbalance in child sex ratio in New Delhi.

survive the odds, the human race will vanish from earth. Compared to this, it can be seen that human population is not based on fertility, but a reduced part of it. Here the natural selection of population is evident and that could be manageable for a comfortable life. Human population is seen enlarged among the poor and dwindled among those who are not poor. It is simple economics of marginal revenue and marginal income in many places. For the poor, a child could be a source of income, need not be expenditure, whereas for the not so poor, the child is an expense account for many years. By this principle, the poor does not feel the strain of parenthood, whereas for others parenthood can be a strain beyond a certain level, and thereby the number of children gets limited. This is just a way of reasoning. Besides, the poor may not have easy access to birth control measures. There could be many reasons why the poor are reproductively rich. Another finding is that the number of children was more in the past than now for an individual. While methods of controlling pregnancy are readily accessible to today's generation, it was not so in the past. There are also arguments that mortality rate was more in the earlier days than now; hence everyone had more children on the simple mathematics of survivability of the infants. It was based on "the more the children, the more might survive" principle. All these premises prove that the factors of childbirth that govern population management are not only complicated but also multifarious. There lies the fun in procreation, though fertile for further studies.

Bad performance of a nation's economy is generally attributed to population. It is a hasty conclusion. The national security principles do not subscribe to this view. In governance by national security, citizen power is strength, not weakness. For this citizens do not mean those who are smuggled or trafficked into the country under devious purposes. The feeling that there is no link between population and prosperity is growing among researchers. The density of population in many prosperous countries is much more than those who are poor. Population density¹³ is one way to compare rather than just population when a comparison is to be made to the theory "too many fighting for too few resources". Table 13.2 gives the density vs. per capita income in select countries.¹⁴

Per capita income is a direct measure of purchasing parity. The table breaks the myth of population as a harmful agent in nation building. How can it be when the very purpose of a nation is to give identity to its people? The primary requirement of a nation is that it should have people in it. Under such conditions increase in numbers means the nation will be more prosperous theoretically. If not, the fault lies elsewhere and not in the numbers of the population the way it has been viewed today. There could be an optimum population with respect to time. It is understandably difficult to calculate accurately. Unless that is taken into consideration, a casual approach leading to a statement that population increase is harmful to a nation is not strictly under the principle of national security.

¹³ Another term for demographic density.

¹⁴ Bagga, C. "What is Population Got to Do With Prosperity". *The Times of India*, Mumbai. 17 August 2004, p. 1.

Table 13.2 Population density vs. per capita income of select countries (2004)^a

Country	Population density (per sq km)	Per capita income (US\$)
Singapore	6751	24,389
South Korea	491	19,497
Netherlands	477	27,108
Belgium	338	29,127
Japan	335	28,700
India	319	2537
North Korea	184	990
Myanmar	62	1733
Kenya	52.4	1089
Nicaragua	39	2176
Sudan	15	1387

Fig. 13.1 Population density—income-level window. (Paleri, P. (2008). *National security: imperatives and challenges*. Tata McGraw-Hill Publishing Company Ltd. p.)

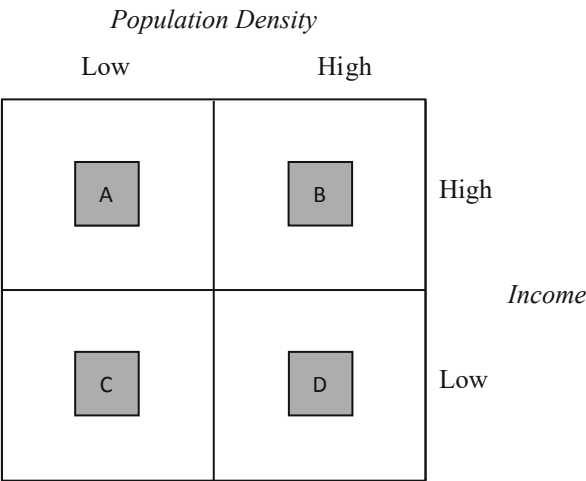

Figure 13.1 is a runaway diagram to understand this argument. It is just a model diagram to prove the theory increase in population has nothing to do with the decline of a country. The categories of nations with varying density and income could be viewed through a population density window given in the figure. The figure has to be seen in conjunction with Table 13.2.

In the window, a country can be compared relative to another taken as a standard for optimum density-optimum income nation. It is a game that could be played well with nations to compare with each other from their perceptions about themselves. Assume that India is taken as the optimum standard for low density-high income from the Table 13.2. Then India will be in block A. The block ideally should have all the countries whose population density is less than that of India and income more than it. There are no matching countries in the table here. All the countries in the

table that have less density have less income than India. There is an anomaly here, because it cannot be true that India is highest in income parity with respect to its population.

Move India to B—high density-high income sector. All those countries that are higher than India in density and more than India's per capita income will fall in here. They are the countries above India in Table 13.2. It makes some sense that India is not alone in this windowpane. Now move India to C—low density-low income group. The countries available are those whose density is lower than that of India and also the income. Here again there are quite a few supporters. Now in D, India could be high density-low income group. The companions will have to have more density and lower income. There is none.

Everybody knows that this cannot be true. In this example, India could fit in two windowpanes at the same time. It cannot be mathematically true. Similarly, the other two panes cannot be blank at any time in the window unless the windows are made of incompatibles. This is an interesting find, which makes not only mathematically but also logically the “population increase causes poverty” theory an absurd concept. It can happen if governance is rooted in absurdity. Don't blame it on population. It also conveys a hidden message, which is yet to be proven, though—that a nation's strength lies in its people provided they are “considered” and that way. This should also apply to any human system.

The argument needs to be routed on the fact that when the density is considered, it should only include population-friendly part of the terrain—in other words, the terrain suitable for people. This also brings out the question posed earlier: how much land does a country need? An answer could be as much as where its population can reside and multiply. The problem is that it is not yet known how much population a country should have to call it optimum. Unless an answer is found for the optimum population for a particular nation, the theory of population explosion and controlling population becomes absurd. The requirement of hospitable, population-friendly terrain comes next. There are many nations with uninhabited or rather highly inhospitable and resource-depleted land territories. What are the advantages of keeping such real estate? That is another question.

A balanced population is the optimum size appropriate to a country considering it as a closed system. It has to be a derivative based on the adopted planning strategy.

Maximisation of demographic security calls for balancing the population by numbers, sex ratio and age ratio. This can be adjusted by careful planning in a closed system. In an open system in which invariably every country is either a primary receiver or a primary donor, the movement of people externally and internally also matters. This factor needs to be superimposed while analysing the optimum-balanced population. The growth rates are rapid, slow, zero or negative. The ideal demographic structure is balanced growth that has to be calculated with respect to the period like in human resource planning. The balanced growth will have the ingredients of all types of growth at varying periods. The control of the state over the growth even in the case of a planned approach is limited. It is more appropriate to adjust planning strategy with respect to national development by regulating the movement of people by migration. It needs extraordinary prowess in governance

of a nation. It is a question of control, regulation and replacement. Adaptability to population momentum is important in demographic security.

13.4 Demography and Economic Growth

There are many scholarly studies on the population vs. productivity factor. Most of them point out that demographic enlargement may not be a cause for economic decline as argued earlier in this study. Besides various assumptions in such a study, there are also other factors that are socio-psychological. When a nation talks about demographic dividend, it means that the population is quite young unlike another where people are greying. It also hints at possible economic growth. But what if the young turns out to be anti-social or anti-national as adults with rebel views as anteforce¹⁵? It is quite possible for the young to get radicalised by religion, politics and other belief systems or frustrated under depression or incompetent national governance. They won't be there in the make-believe demographic dividend circle (Box 13.1). In fact, according to the author, the probability of a person turning out to be an anteforce in a nation is more than becoming constructively productive, under bad governance coupled with demographic stress. Ideally, economic growth should be proportionate to demographic density considering every human is productive. The question is not whether every individual is positively productive, but, assuming it is true, can there be a limitation to it by which the population-productivity curve turns out to be an inverted parabola or a bell (Fig. 13.2)? The chances are more for the latter. It is hypothesis based on biomodel thinking based on the saying "too many cooks can spoil the broth". According to this curvaceous thinking, population is necessary for productivity. But productivity and thereby economic growth can decline if the population exceeds the critical limit. The idea of critical population, if called optimum population, can raise an argument to find the right density of population for a country. All these are idealistic thinking when one appreciates that population is not a resource but a dignified human who are intellectually motivated every moment as a force or anteforce. Therefore, the people of a country will be a mix of both types.

¹⁵ See also Chaps. 2 and 5. Anteforce (author) is destructively or lethargically productive individual human or formal or informal human system. Author's contention is that the anteforce can be turned around for productive investment in the human system by capitalising them through human investment governance in national security management by HIM. It needs to be studied further though there are many examples available. The rehabilitation programmes are aimed at turning around anteforce to productive humans and human systems.

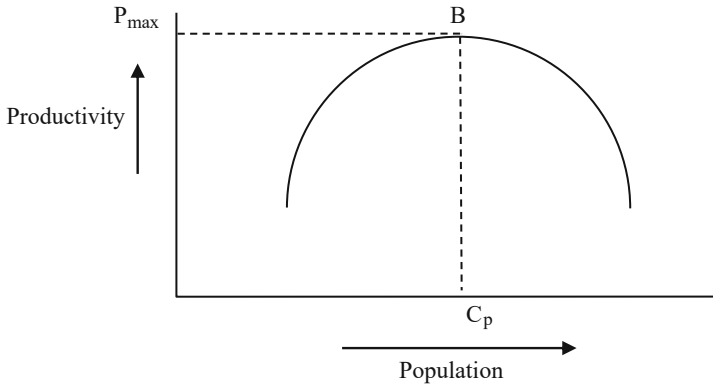

Fig. 13.2 Population vs. productivity hypothetical curve

Box 13.1: Does the Young Population Guarantee Rich Demographic Dividend?

Ideally, yes. But need not be realistically. The argument behind the answer is that a substantial part of the young demography can also turn to anteforce. The governments can change it. In fact the young anteforce counters the productive returns of the young force. This means to counter the anteforce a nation should enhance the return of the force. The key is HIM.

The people should know the government, and the government should know the people individually and in groups. This is the idealistic realism or realistic idealism based on the country in question. That is why governance will be different in every country, but the goal could be made standard so that the output could be indexed for comparison. In national security interventions, governance is relative to the government, but the expected output is standard—human well-being. The job of the government is to make use of both the force and anteforce within the demographic system. The force can be productively invested and the anteforce changed to force and invested. This is not as complex as it may sound. Governments of any country will have the capacity to do it unless they support and nurture the anteforce within. If demography causes decline in economic growth, then humans are not at the centre of national security. That is absurd. But does demography matter growth? Ideally it should, according to the argument.

Population at which productivity is maximum (P_{\max}) is called the critical population for a country in this hypothetical case. It is idealistic. At P_{\max} the population is critical (C_p). It is a kind of yield point. Any increase in population at C_p can damage the process of governance ideally. The population of a country needs to be kept below C_p according to this argument. But that is not the way population will behave. Humans are not resources that simply follow straight-line variation. The presence of anteforce within the system also matters. This is what the governments have to see.

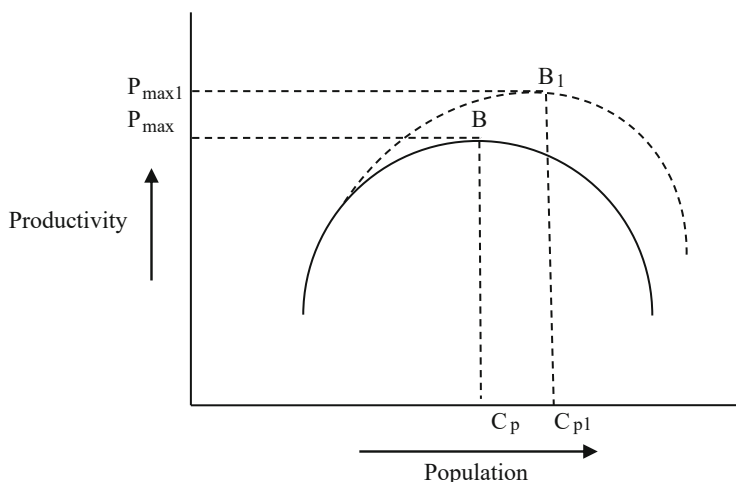

Fig. 13.3 Shifting B in the population vs. productivity hypothetical curve

By governance under national security maximisation process under process deviation from P_{\max} to NS_{\max} , a government should be able to enlarge the curve in Fig. 13.2 and shift C_p further to right.

This will depend upon the quality of governance (Fig. 13.3). This is also the principle of human investment management.¹⁶ It is a situation when population turns to totally productive in a country which will certainly have a limit, though. This is the crux of demographic security—using people’s productive capacity and power to energise and enhance national security governance. There are biomodels.

The demography-productivity debates are seen around the world. For some productivity may mean religious density. They believe if there are more people in a particular religion it may acquire more bargaining power. It need not be true especially from the perspectives of quality life. It could even be self-destructive.

Often quoted examples of demography and economic growth include the United States in the baby boom growth,¹⁷ Japan in the late 1960s and China in the early 2000.¹⁸ The argument is that the more the people, the more the workers. That brings in more savings. Savings are converted into capital that in return produces more wages and more savings. The cycle of more jobs, more virtuous income, demand increase, enhanced savings and more investment continues. It is an ideal situation.

¹⁶Paleri, P. (2018). *Human investment management: raise the level by capitalising human*. Springer Nature Singapore Pte Ltd.

¹⁷The birth rates spiked in the world after World War II. The population explosion of new infants became known as the baby boom. Almost 77 million babies were born in the United States alone. It comprised nearly 40% of the American population. Most of them rejected and redefined traditional values.

¹⁸Singh, V. “India No. 1, by 2005? Just Child’s Play”. *The Times of India*, Mumbai. 17 August 2004, p. 8.

The opposite is virtual disappearance of savings, and then income and capital-induced opportunities. That could be disastrous.

What if humans are not productive for certain reasons such as pandemic lockdown, contagion deaths and panic, war-burrowed, citadel locked, locked out from workspace, disaster washout, incarcerated, medically sick or quarantined or simply lazy one fine morning? The theory “more people less money” to share seemingly becomes valid under such situations. Ideally, it should not be otherwise. It is also the proof that more people can actually create more money if they are productively active. In that case more people can share more money. Then where is the catch? The catch is in linking money and people. It is in considering demography as the sole income generator or destroyer. It is similar to a king’s dilemma of slaying a killer dragon in whom his heart beats! In other words, if that is so, then demography should have been a part of economic security. It is not so. They are different, but mutually inclusive elements in governance. It is not demographic counts but the productive performance that matters. In a pandemic situation, a productive set of people become non-productive sans opportunities. During world wars men were conscripted for war, and women took their positions in manufacturing.¹⁹ This is the proof that it is not the number of people or in any case overpopulation that hinders economic growth but performance of people that adds value. Hence government should be able to use the demographic setup for economic growth by making them productive appropriate to situation. That means good governance can use demographic factors for economic growth. Of course, the law of limitations will limit this desire. After certain stage, as if in a bell curve, demographic density will give up. Bad governance will collapse the system under the relative demographic pressure. That is where the concept of optimum population breaks in.

Optimum population is the maximum population a country can bear for maximum economic growth. There are many issues here. One is the count of optimum population. It varies for each country based on facilities for quality life. It also means if facilities are upgraded optimum population could also be increased or vice versa. Here optimum population becomes a variable. Ultimately this variable will depend on efficacy of governance under limitations. Hence demographic factor in performance maximisation is a deep-rooted subject in national security governance. The important point here is demographic density shouldn’t make a government either restless or euphoric. It certainly increases the pressure on governance. That should not be a problem for a government that is capable.

As societies develop, the birth rate declines, unless of course birth rate is decided by other factors such as faith, circumstances or necessity. The number of older people increases when health rate improves. This also depends upon how one defines “old”. The demographic scale is reversed when there are more aged than young. At this stage, another question, besides optimum population, pops up, as an addendum of sorts. How many people a country needs and in what age group? These indicators were visible in developed nations. The savings in the demographic booms will peak

¹⁹ An example is World War I where a large number of women were hired to ammunition factories.

after some time and then fall off or the trend may continue. Many nations may be moving towards peak demography. That is how it can be seen in effective governance. After peaking on the level, the countries may stay there for some time before the trend reverses. It is at this stage they have to prepare for eventualities. The nations that see the upsurge may also witness others declining. This is when power balance will shift. It is possible with savings being converted into productive investment. It is important to understand here that peak demography may not be optimum demography.

All these mean that one cannot discount the capabilities of people. Population, ideally, is strength for a nation. What makes the difference will be the way societies behave. Constructive collectivism and demographic security-based power governance may throw to the winds the belief that population explosion is destructive to a nation's economy as a myth. The globalised world can be engaged only by the power of the people. And the next superpower may be the one that has it. This is an intuitive statement. The keyword here is optimum population. It varies from nation to nation and is an extremely difficult figure to arrive at. The cry about population explosion is hidden in the anxiety induced by this helplessness.

Though not a direct part of national security studies, the author's idea of investing humans in activities with the objective of highest return, beyond the point of a resource, may hold some meaning in considering humans as powerful and live production capital. The subject is called human investment management (HIM) that may make the conventional human resource management (HRM) passé. Below is an overture to HIM.

13.4.1 Human Investment Management: An Overture

Human investment management “considers” (Sect. 3.3, Chap. 3) humans are productive for a system. Human investment management (HIM) is about investing and thereby capitalising people in productive activities.²⁰ It is about treating humans as self-appreciating as well as depreciating investing instruments that can be capitalised. Productive returns fluctuate in situ as well as increase naturally with experience gained by repetition through time and decrease under constraints. In HIM, humans are never considered resources, but those who optimise resources for maximum result in an activity. Though recommended for organisational management whether military, corporations or other formal human systems, including anteforce systems, the technique can be researched for rich demographic dividends where the only condition is that the individual is an active human.²¹ Age and other

²⁰Paleri, P. (2018). *Human investment management: raise the level by capitalising human*. Springer Nature Singapore Pte Ltd.

²¹Military management and certain corporate governance (Taj Hotel in Mumbai, India, during the terror attacks and after on 26–29 November 2008) carry shades of HIM.

aspects do not matter seriously. But HIM leadership does. Leadership is at the highest level in national governance. Therefore, the author feels seriously that HIM could be a great leveller in demographic security to enhance positive productivity in national governance.

According to the author, HIM can support demographic security for productive national security. It can be applied to any situation: nation building to family management. The basic aspect of HIM is considering humans in a group as an investment capital and placing them individually in a position where each one of them can yield maximum returns. It is beyond the conventional human resource development (HRD) practised since long. The subject is yet to be developed the way visualised by the author, though in many organisations it is used without being descriptive about it. Military is one of them. It is practised, though not as HIM, under varying situations in other fields too: in movie making when the actors are chosen (not when movies are scripted for actors), in a team when the players are fielded, in a hospital where the doctors are allocated duties and in circus and in many other human systems, temporary or permanent. It is about investing a person in an assigned duty with the objective of accruing maximum return for the investment. It can be done scientifically under the principles of HIM.

A human being is activity prone. He or she is productive in the process. The productive quality can be capitalised by proper investment. The return, quantum of productivity, varies as and when the individual is trained and self-actualised and gains experience. These aspects can be seen from the point of maximisation. The returns from financial investments can be maximised by continuous portfolio research and management. Similarly returns from human investments in an active organisation are believed to be maximised by continuous activity management and capitalising productive human. That is the underlying principle of HIM.

This argument leads to a much-talked-about and interesting trend attributed to the ancient Hindu society—the caste (*Varna*²²) system. In the caste system, people were divided by the tasks they performed: *Brahmins* in the intellectually oriented knowledge creation and retention activities, *Vaisyas* in the intricate wealth and economy balancing activities of trade and finance, *Khsatriyas* in the protection and security tasks that are strategically vital to a society and *Sudras* in the ever-supporting service jobs. The people involved in these jobs were the best suited for them. The system originated by in-house learning and practice that was the most probable procedure in societies of yesteryears. People followed the elders in the family, supported in their works, learnt in the bargain at good speed (in a steep learning curve) and passed the knowledge on to the next generation. The cycle continued, and so the *Varnas* by birth even though the people slowly moved into other fields of their choice. *Varna* was a natural process and very acceptable to the principles of HIM. Unfortunately, the caste system based on the *Varna* principle divided the society under a class

²²Encyclopaedia Britannica, n. 1. *Varna* in Sanskrit means colour. This has also brought in speculation that caste systems were originally based on differences in the degree of skin pigmentation.

system. HIM speaks about caste system without class system. It considers everybody a competent contributor in a common system and utilises the person to the best benefit of demographic security. It is fielding the people in the place of maximum return. There are no right people or right place. There are only people and places where the people can be fielded best.

In spite of the derogatory status the caste system in Hindu society acquired by misconception and natural and submissive exploitation, it is prevalent all over the world in one form or another and is expected to continue all along. This creates dynasties in more than four castes (or *Varnas* as explained earlier) as and when the world evolves. In this system, the children become what their parents, especially the leading parents, were. The caste-based dynasties are everywhere, where the children take over their parents' occupation: politicians, actors, artisans, industrialists, peasants, missionaries and so on. Every child reflects its parents in every respect. Intellectualism and subsequent deviation from the mainstream parental hold are different. The dynastic offspring, especially politicians, are accused of family (dynastic) rule and getting the privileged job in a platter. The fact is that people generally will fit the best in what they are conditioned by birth. That applies to political families too. Mother's cookies are the best because she learnt it from her mother. The caste system is not something to loath about. It shows human expertise and value. The system has grown much beyond the four *Varnas* explained earlier. Caste system values family and tradition. The modern cast system and the way it is continuously evolving can provide insights in human investment management in any field. One has to attribute it to the way demography has shaped up from ancient times. There is nothing unnatural about it. People will move always in the direction of the job they are best suited for and finally settle in the appropriate role if time and health permit. Many may achieve it. But the majority will be in that direction throughout their journey. Even in a situation where the parent is not able to reach the chosen position, the offspring may still take over that mantle. Caste system has nothing to do with ethnic imbroglios; unfortunately it is attributed to it. Promoting human investment management concepts could give equal importance by value to people in a society and eliminate the conditioned caste-based apathy. In its real sense, human investment management should outpace human resource development as a subject. Organisations that can practise HIM can expect better return from people. Scientifically, it is an aspect of understanding the value of the people and identifying the best available role for them individually in a group. It is an advanced form of HRD. When governed at the national level, it becomes demographically accelerated HIM that is expected to maximise demographic security. HIM is human value enhancement by appreciating the dignity of the individual, irrespective of what he or she is, through productive activity profile. HIM can be shaped as one of the tools to maximise demographic security.

13.5 Human Migration

Since the time humans learnt to walk, they kept running.²³ They walked when tired of running; squatted when tired more. They stretched with their backs on the terra firma, the ground, when tired to the extreme to charge themselves for the next move. Their pedestal locomotion took them around the planet, all the time clasping the land.²⁴ Initially they thought the world was flat. Today they know it is not, but they still move flatly searching for new places for many reasons. They are becoming more and more dynamic unlike in the past when majority preferred to remain static for existential convenience.

Locomotion began even before the humans learnt to walk. Adults carried their babies to new places.²⁵ People moved from one point to another using various modes of transportation. Some decided to settle down at interim places in their journey. The distance to a place was measured by the time taken to move in terms of a day most of the time. It is so in many remote villages and tribal areas even today. That is why normally the distance measured on land is not the way the crow flies, but the distance the path leads to the destination. The distance of 20 days' walk to the next village may be an hour's journey by air in today's dynamic measurement.²⁶ For a question, how far is it? The answer could be, "30 minutes by cab" in today's context. It shows the way people measured distance—by what mode of movement it took them to reach there. That is the only difference today.

²³The new finding is that the humans are designed and evolved to run, as seen from the design of their legs and bone structure. It was necessary for survival. Simon Worrall. "We Evolved to Run—But We are Doing It All Wrong". <https://www.nationalgeographic.com/news/2017/07/running-books-jogging-health-science/>. Accessed 29 March 2020. Running faster than the threat that follows is the perfect tactics in life in the strategy of survival. It is understandable that humans needed the shape and strength to run for survival considering their physical weakness compared to the predators including their own species. But that is not all; humans also had to run towards the prey at times to hunt.

²⁴Land-clasp syndrome. See Paleri, P. (2014). *Integrated maritime security: governing the ghost protocol*. Vij books (India) Pvt. Ltd. p.

²⁵Alan Kurdi, a 3-year-old Syrian Kurdish Kid died on his way to Europe for refuge drowning in the Mediterranean when the heavily crowded inflatable boat operated by human smugglers capsized. His family of 4 was said to have been attempting escape from the civil war and ISIL (Islamic State of Iraq and Levant) ethnic cleansing attacks in Syria after paying a hefty sum to the smugglers. His body was ashore along with others and became sensational news. Wikipedia. "Death of Alan Kurdi". https://en.wikipedia.org/wiki/Death_of_Alan_Kurdi. Accessed 18 March 2019.

²⁶This does not mean that the instinct to migrate is inherent in every human being. People who belong to restricted civilisations or arrested in their culture like the aborigines and tribal are more static than others. These people are all over and the governments have a responsibility towards such people. They are very much included in the concerns of demographic security. However, around the world, indigenous people are fighting for their ancestral territories. They are also gaining power in mass movements in developed nations like the United States, Australia and New Zealand. They want to defend their inheritance at any cost—all because they are static and prefer to remain that way by some unusual mindset.

Time measures distance in comparative metrics. Time and distance became cohabitating elements like current and resistance in voltage measurement. But the former has a deep-rooted behavioural aspect hidden in it—unsatisfied migratory tendencies, where the other side is greener or safer.

Irrespective of the pace, the instinct to reach out was insatiable in human mind as if beckoned by a mysterious force residing on the distant mountain of salvation. This can be seen subliminally in a visa application. The golden fleece of salvation was unattainable, but the people continued their journey across the plains, fields, forests, deserts, snow-capped mountains, rivers, oceans, etc. Some were in a hurry; some at a comfortable pace. Sometimes they were led by an identified leader. Today there are also people who transport people for hefty fees unknown or known to authorities.

Sometimes humans moved under identified leaders. They limped and crawled when their feet gave up, still remaining dynamic. In some cases, the strong carried them on their back. Sooner they were carried or pulled to distant planes by animals they domesticated. The story of transportation is hidden here. Every means of transportation is symbolic to the human instinct to run, faster and faster, escaping as if they are stalked by deadly predators. It was this invisible predator, amplified by fear and insecurity that brought the changes. It is still behind them today, and the humans continue to run forward, wherever they are, carrying the existential dread with them. Unlike other forms of life among them, every human, including the meek and handicapped, inherited the earth by migration at different rates. Agriculturalists were slow, but hunter-gatherers were more mobile. Movements were governed by purpose. The dynamic in most of the cases conquered the static. But the static nurtured culture.

People moved as if it was necessary to spread out over the world lest it should topple over. The world was the container, and the humans filled it by reaching out to the extremes like a gas in a closed container. In demography, there seems to be a law that humans will inherit the entire habitable part to the earth ultimately. If that is so, it has already happened. Only the density is increasing. The process of migration never stopped. It continues even today. The urge to migrate and spread out is security driven and thereby becomes an instinct. It is visible in a biomodel. Even in a small habitat, humans fill up the entire habitat available to them in the course of time. It is seen from the overflowing cities the way the dye spreads in a crack. Governments should never expect the people to remain within artificial boundaries if there is space beyond it. It is applicable not only within a state but also across its borders.

This tendency, to spread out over available space to the extent perceived—not limited by law—is an important point that needs to be noted by those who advocate taking cities into the villages as a way of containing migration. There is a belief that demographic problems of security can be resolved by bringing cities to people. It means creation of urban conglomeration within a rural setup to prevent migration of rural population to distant cities. It is believed that in such cases people may remain in their villages and also enjoy facilities of a city next to them. It may not be so. Migration will still continue because it is an instinct driven by needs. The instinct is rooted in the original behaviour, hence extremely strong to contain. People migrate under sublime calls often not with a definite objective, but hope. Where

there is hope, it is definite; hence location may be different, and urban packet within the rural area may not serve the purpose. The people in the rural cities or satellite towns will soon eat into the surrounding rural habitats in the course of time. Most of the mega cities of the world today were rural or satellite townships once upon a time. Exceptions are those that are built as mega cities in open spaces. They are synthetic cities; some of them being mere theme cities, with no claim for heritage—Las Vegas, USA, for example. Cities that grow in course of demographic evolution and development are natural. A city created overnight is very synthetic where people by virtue of their nature will feel artificially incarcerated in the long run.

Illustrations from the past point out continuance of migration of people throughout human existence. It could stop perhaps when the world is a global village. Even then it is only a theoretical assumption, absolutely idealistic. It will then be called internal migration. Humans are genetically designed to explore and multiply. They will inhabit the land to its fullest extent. Where it is not habitable, technology will find a way to support movements. It is already happening in the townships and other human settlements. It began with industrialisation when the industrial townships developed away from normal human habitats. Today, migration is restricted to land terrain alone. People have not moved into other geographical or physical terrains yet. One cannot just “walk” in there. Migration in traditional mode is a “walk in” process. Of course “drive in” is a modified form.

Author Spencer Wells’ writings about human genomes and the journey of Y chromosome open the lid to this finding about human instinct to travel.²⁷ First evolved in the centre of the tropics in Africa, 50,000 years ago,²⁸ humans migrated to various parts of the world in the years that followed and multiplied. It would have been a wonderful journey for them and their generations if Wells’ narrative is followed through various terrains in the world, mainly over the land, watching the changing geography, vegetation, animals, seasons and landscapes and gradually transforming themselves and their genes before settling down at the land’s end near the oceans that they could not cross. What a world, and what a wonderful life it would have been! One may wish to be there. Those who settled in the course of their journeys put their claim for the territory and resources around them. There was never an original owner for land. Humans were born on it; then took over it on first-discovered, first-owned basis; and thereafter bartered it for a consideration where it was not snatched away by another.

But all migrations were not voluntary. There were non-voluntary migrations in history. People were forced to leave their habitats against their will. People moved as slaves, prisoners of war, hostages and under coercion and various other threats of demographic imbalance as emigrants across the world. The eighteenth and nineteenth centuries witnessed the largest ever slave trade. Fifteen million people were shipped against their will to Brazil, the Caribbean and North America from Africa. About 40 million people were sent as coolies from China and India to various parts

²⁷ Wells, S. (2002). *The journey of man: A Genetic Odyssey*. Allen Lane, The Penguin Press.

²⁸ This timing can change with new findings.

of the world.²⁹ Coolies were cheap labourers whose status was not better than slaves in most of the cases. They were bonded to their employers. Prisoners of war spent their time in jails across their habitats or found new places and mingled with the races around. Though relatively small in numbers, people including children were kidnapped or lured with money and facilities for scientific experiments, sex trade, risky entertainments like camel races, household jobs, organ trafficking, etc. from among the vulnerable in various parts of the world.

The largest movement of people in the history of nations came about in 1947 when India was partitioned immediately after independence from British colonial rule. In the biggest disposition of what it came to be known as colonial shame and cruelty of modern times, 14 million Hindus and Muslims were displaced across India and Pakistan in the bloodiest exodus. The world watched in apathy, while the governments of the two countries stood helplessly confounded in sheer ineptitude. It was a mammoth and traumatic movement of people as per the population standards of the world in 1947. The impact and injuries of the partition are still felt and may last centuries ahead. The attributability of blame on those who were considered to be responsible is increasing as time passes by. This is a rare phenomenon in blame throwing and an interesting find. The increase in demography increases blames on matters that affected the human systems. According to many, those who caused or supported this exodus have no place even in the dirtiest and rotten sewages of the world for the crime they committed. It was a crime against humanity attributable to those who mattered in authority. Many may turn in their graves restlessly till eternity. The guilt will surpass life. These are the people whose places in history should be in the obituaries of ignominy. The impact of that migration is writ in the psyche of the people of both the nations even today in dissolving colours of extreme emotions. It was a shame on both the nations and a permanent blot on the religious ethics of Hindus and Muslims of India and Pakistan that may never dissolve even in the strongest sentiments of tolerance and humanity; both the faiths are known to preach in solidarity. Though understood well³⁰ the wounds are not expected to heal for many years because memories last beyond generations. Even if it heals one day, the scars will remain for centuries. Ethnic hate will simmer and transform into strange behaviour patterns.

²⁹The Economist. (2001). *Making sense of the modern economy*. Profile Books Ltd., p. 18.

³⁰Ahmad, R and Joshi, A". PM Calls for New Kashmir", *Hindustan Times*. 17 November 2004. p. 1. Dr. Manmohan Singh, the prime minister of India is a Sikh by religion. In his address at Srinagar, in Kashmir, he stated that he was against another partition of India in resolving the Kashmir dispute. He himself was a victim of the trauma associated with India's partition on religious grounds and the fundamentally foolish acts of humans in an age when tolerance to fellow humans was just dawning. Certainly today the world should be a better place not to allow such partition again (very evident from this historical biomodeling) that may cause trauma and agony to many and drag the humanity to centuries back in a civilised and secular country. He was very right when he made this statement and belonged to the genre of the people who have understood that life is a momentary affair and one should not damage it.

Table 13.3 Refugee population by country of origin^a

Claimed nationality	Refugee population
Afghanistan	2,100,000
Sudan	606,200
Burundi	531,600
Congo	453,400
Palestinians	427,800
Somalia	402,200
Iraq	368,400
Angola	323,600

^aPaleri, P. (2008). *National security: imperatives and challenges*. Tata McGraw-Hill Publishing Company Ltd. p. 215

There were other reasons too for human migration. People moved leaving their land behind because of disaster situations. There were rehabilitation by industrialisation and developmental projects. Some went as asylum seekers or as refugees fleeing from conflict zones. There were others often lured by the “enemy” to migrate—shift over—in psychological operations.³¹ The patterns of non-voluntary migration still continue today under troubled imbalances in national distribution of people. There is news that the world refugee population is decreasing. According to the United Nations High Commission for Refugees (UNHCR), it is around 9.7 million in 2003.³² The refugee population by the country of origin according to the United Nations is given in Table 13.3.³³ But, according to another report, there were 38 million refugees in the world in 2003. It is a number comparable in the aftermath of the World War II.³⁴

Though unaccounted in the above list, an alarming proportion of Sri Lankan refugees were in India subsequent to internal turmoils in their country. In 2004 there were about 60,000 Tamil-Sri Lankan refugees in India. They return in batches when the situation is conducive or when organised by the governments through the UNHCR. Most of them leave by illegal boats that may take them across at about US\$60 per person because the UNHCR process takes several months. The fare is equivalent to 2–3 year’s earnings.³⁵ In Sri Lanka, the Tamil separatists have fought

³¹ This part comprises people of a country who for a consideration that mainly will be an all needs met asylum, for participating in subversive or terrorist activities or supporting the invader in war against their own country. The psychological operations mentioned here mean that the purpose was to psychologically defeat the nation as well as use the knowledge of these people in subversive or terrorist activities. There are nations who support such activities. No examples are quoted here.

³⁴ Kapoor, M. “With Irrational US, Global War Can’t be Ruled Out, The Indian Express, New Delhi, 18 December 2004, p. 1. Such clashes of information are not to be taken seriously since this book is not a statistical projection of refugee situations in the world. But it is important to understand that data projection could be ambiguous and contradictory.

³⁵ Drapkin, J. “60,000 Tamil Refugees Return to Lanka”. *The Asian Age*, New Delhi. 21 June 2004. p. 5.

the government since 1983 for a separate nation for minority Tamils, accusing the majority Sinhalese of discrimination. About 60,000 people died in the conflict before the Norway-brokered ceasefire temporarily halted the violence in February 2002. Peace talks were suspended in April 2003 after the rebels insisted on wider autonomy. According to the Indian Coast Guard sources, since the beginning of 1996, in a second flare-up of insurgency in Sri Lanka, 21,024 refugees had arrived India.³⁶ Refugees are also prime commodities for human traffickers tangled in Crimes3.

There are two issues in analysing refugee demographics. First, everyone who migrates is not a refugee under the law. Second, the migration is continuous. Therefore the data and situations will vary on different dates. National demographics under migrant population, therefore, has to be seen from the legal, which include recognised refugees,³⁷ (Box 13.2) and illegal that covers others who are smuggled, trafficked and also on transit to another country of choice.

Box 13.2: Refugee or Not Refugee?

In a unique case in 2013, an alleged climate refugee from Kiribati, Ioane Teitiota (claimant) sought a decision from the court in New Zealand for remaining in the country along with his wife on expiry of visa on the grounds that his country was sinking under climate change. It was for the first time such a plea was heard by any court in the world. The court, however, rejected his appeal on the ground that he was not eligible as he was not a refugee under the UN Refugee Convention. The court also observed that he was not going to face persecution on return as his position was not different from any other Kiribati national. The argument was “unconvincing”, the court observed. It was later upheld by the Supreme Court. Presently there is no law under which similar displaced personnel can qualify for asylum. But such people do face persecution by nature. The question here is what if a whole nation is inundated by sea level rise. The people of such nations can become refugees of nature, and many countries will be burdened by their influx on one side and the pressures from international community to accept them on the other upsetting their demographic signatures. This calls for international regime not only on matters of sinking nations but also of those who will be pressurised to accept the displaced people. The author considers there are options under win-win situations. They are reserved in this study.

In the present scenario (2021), the world refugee population has more than doubled. It is estimated that more than 26 million refugees live in host communities. The year 2021 specifically showcases the largest refugee crisis so far in spite of the C19 pandemic that demands correct observation of pandemic protocol and etiquette including restriction in the movement of people (Box 13.3).

Box 13.3: 2021: Surging Refugees

According to Amnesty International, the world doesn't seem to be sufficiently concerned about the plight of refugees.³⁸ Amnesty is more critical of the countries they consider rich than middle- and lower-income countries. There are 26 million refugees worldwide, among whom 85% are hosted in developing countries. 6.6 million refugees are only from Syria that tops the list. They are hosted in 126 countries. Many refugees return to their homeland. According to this study, the situation can become worse when there are people dislocated by sea level rise. The fact is that these people will not be able to go back until the sea returns to normal by withdrawal. It will take a very long time through many generations. The issues of people persecuted by people and those by the sea are identical though legally different. The host countries too will reel under pressures of refugee influx.

Most of the voluntary migrations in the world since the beginning of the nineteenth century were based on economic reasons. Cheap land was the main consideration. It was available for the taking across the oceans. People wanted a better life. The movements, though often risky in the early days, were calculated. These people created wealth in their new lands and enjoyed the benefits of it. They built nations. The United States stands in the forefront of a migrant nation. It absorbed 40 million of the 60 million people who moved out of Europe between the middle of the nineteenth century and the beginning of World War II.³⁹ The rest went to Australia, Canada, South Africa, New Zealand and Latin America.⁴⁰ They were, in some sense, adventurers who dared to cross the oceans in a big way with intention to stay permanent at their destination.

Uncontrolled migration for economic reasons caused problems of economics. This made governments to introduce and modify rules. National policies changed. The United States shut the doors to marked people: prostitutes, lunatics and convicts. The Chinese migrants too found the doors closed after 1982.⁴¹ The immigration policies of nations changed with respect to situations. It is a question of relative advantages, though xenophobia is a deep-rooted feeling that further leads to ethnic

³⁹The Economist. (2001). *Making sense of the modern economy*. Profile Books Ltd. p. 18.

⁴⁰Ibid., p. 18.

⁴¹Ibid., p. 18.

conflicts. Today, migrations are based on employment opportunities at an increased income rather than cheap land.

Nations tighten their immigration laws depending upon demand and supply. A serious shortage of labour or specialised labour may open the gates, but a surplus or a racist regime may tighten it. Adolph Hitler's (1889–1945) Germany was very particular on restricting immigration policy to safeguard the purity of the German race as envisaged by him. Today, no agency is clear about the nature and number of migration. It can only be extrapolated based on information gathered at various points and by various agencies dealing with the subject. But, everyone agrees on the dynamic model of human population that is restless and is always on the lookout for better pastures in the world. The ILO is an authentic source. According to its records, about 80 million people live in countries they were not born in. Another 20 million live as refugees from natural disaster or political disturbances. Each year, about 1.5 million emigrants are on permanent move, and another million seek temporary asylums abroad. Foreign nationals as percentage of the total population are increasing in small countries with lesser population. The countries that primarily attract people—primary host countries—in terms of percentage to total population are Australia, Austria, Belgium, Britain, Canada, Denmark, Finland, France, Germany, Greece, Ireland, Italy, Japan, Luxembourg, the Netherlands, Norway, Portugal, Spain, Sweden, Switzerland and the United States.⁴²

Migration is also a term that is not defined universally. The official definition can vary. Calculations and assessments on migration can be misleading. In demographic security, the important aspect is the effect of migration, not the act of migration. The dynamism of movement is vital—it may involve criminal aspects, insurgency-related aspects, brain drain, reverse brain drain, etc. Some of them have to be seen from geostrategic point of view. Temporary migrations are easy to enumerate. Such a migrant looks for a job across the border and has an intention to return or remain non-resident for a considerable time. The temporary residents may remain in employment and return based on the host country's immigration policy. Political, religious and racist make-up also contributes to the return factor.

As per the 2001 statistics, only 2% of the world's population involves migrants. Migrants send more than US\$70 billion to their home countries each year in the form of remittances. The host countries are said to be benefited by their intellectual and labour contributions in return⁴³ (well, not exactly. . .there could be negative contributions as well). National laws in most cases provide enough loopholes in migration that breeds the thriving community of immigration lawyers and disables enforcement agencies. For example, the US law of “dry foot, wet foot” policy for Cubans can make them play *kabaddi*⁴⁴ in water with the coast guard. Under this rule, the

⁴⁴ A traditional game in Indian villages where a player holds breath while getting into the opponents' field and try to touch them to score before losing breath. If caught by the opponents, the player has to touch the centreline, the common boundary, still holding breath to win.

migrants are allowed to stay if they land in the US soil but sent back if caught at sea. The boat people normally get caught. Driven by extreme passion of migration, they come out with new ideas to skip across the border. A woman packed herself in a wooden box—the size of a small filing cabinet—and had herself shipped by air to the United States in August 2004. She was lucky to be alive when found by the cargo crew at Miami airport. She was allowed to stay.⁴⁵ Many are not that lucky. Many illegal self-shippers, stowaways in aircraft holds and human cargoes in containers or barrels have perished in their adventure to migrate to a country better than their own. They became victims of their own helplessness when faced by death on their way to the final horizon. There are also people who move within the country looking for safety and security and end up as internal migrants. These are ethnic issues more than demographic problems. Human migratory process is deep rooted in the paradigms of locomotion of life that are still evading human understanding (Box 13.4).

Box 13.4: Human Migratory Process

Most of the life forms have a built-in tendency to move across, humans too. Humans go much farther. The entire planet belongs to them, though the globe is divided into country alcoves. Migration is driven by survival instinct that could overcome the residual force of nationality. It becomes a matter of governance thereafter.

The demographic sensitivity of the present-day world is the result of many migrations. The largest among them is considered to be the forced migration of Africans in slave trade between 1500 and 1867 across the Atlantic in a triangular mode—Africa-Europe-America, the then new world. It is a part of the history of American slavery which changed America and the then new world to the present-day new world in a demographic transformation. The demographic tint of America today will last for a very long time though still reflected by the flow of people into it from elsewhere. Slavery even otherwise has been a cause for continuing forced migration since 3500 BCE in the globe. In the early part, it was a necessity and established institution under social stratification. The Code of Hammurabi, the ancient Mesopotamian law, refers to it as an approved conduct but have sections on protecting the slave as well as master in terms of respective rights. Slavery needs to be sanctioned by the society in which it exists. The Pentateuch, also called the Torah of Moses, the first five books of the *Hebrew Bible (Old Testament)* recognises and tolerates slavery.

⁴⁵“Cuban Women Ships Herself to US in A Wooden Crate”. *The Times of India*, New Delhi. 27 August 2004. p. 15.

Over the period of the Atlantic Slave Trade, about 12.5 million slaves had been shipped from Africa, and 10.7 million had arrived in the Americas. It was likely the most costly in human life of all of long-distance global migrations.⁴⁶

According to the United Nations High Commissioner for Refugees (UNHCR), 20 million Hindus, Sikhs and Muslims were displaced during the senseless partition of India in 1947. UNHCR considers it as the largest mass migration in human history. But there are many other ways people leave home reluctantly and painfully. One such separation of human misery was when the Armenians had to leave their homes on orders of the authorities in 2021 (Box 13.5), when the world is stepping into the world of the sapien as the author wishfully expresses for change of human life in a paradigm shift in the new century (Chap. 25).

Box 13.5: Armenian Story⁴⁷

It is painful and a bit choking when owners set fire to their own homes as they leave them under force along with shattered dreams they lived with. Ethnic Armenians did it in November 2020. They not only lit the fire but also ensured the flames consumed the whole house in the small village of Charektar, in the Kalbajar district of Azerbaijan bordering Nagorno-Karabakh. The reason? They didn't want to make it that easy for the Azeris with whom they were fighting to come and occupy them. The whole village was in smoke. The residents did it. They decided to scorch the earth before handing over the village and the territory they were in to Azerbaijan under a Russia-brokered peace deal following a 6 weeks of fighting with the Azeri troops over the enclave of Nagorno-Karabakh and the surrounding areas. That is how nations get micronised and people get demographically displaced in a dynamic world when governments find it difficult to settle issues of ethnicity and demography.

The largest documented voluntary emigration in history was the Italian diaspora, which migrated from Italy between 1880 and 1915, with 13 million people leaving the country.

The impact of human migration is not only in the country of destination but also in the country of origin besides in the country that serves as the spring board. That led to the one highly profitable Crimes3 today—human smuggling and human trafficking capable of changing the course of any country like a revolving storm at sea for a ship.

13.6 Human Smuggling and Human Trafficking: Other Side of Migration

Smuggling and trafficking in humans is a criminal activity which is an unlawful act. It has been discussed as part of Crimes3⁺ (Chap. 6). This section looks at the acts of smuggling and trafficking in humans from the demographic point of view as an act of illegal migration.

Smuggling and trafficking in humans are mostly organised illegal cross-border operations that fall under the purview of transnational crimes. It is a significant threat to nations where such people land surreptitiously evading immigration laws and also taking asylum under the national laws when apprehended, often with external help. Such movements of people upset the demographic security of nations they leave behind as well as the country of destination by imbalance unknown to the governments. There can be survival, political or religious reasons behind human smuggling or trafficking. It is a threat to governance. Smuggling and trafficking syndicates use various methods to carry out their activities. They are resourceful and primarily use corrupt practices to push people across.

There are differences in human smuggling and human trafficking. The commodity is different here. The countermeasures are also accordingly different. Human smuggling is illegal emigration (leaving a country of citizenship) and immigration (entering another country) facilitated by a third party at the will and desire of the participant. Professional transporters move the human cargo for a consideration. The less serious smuggling is done by people helping friends and relatives enter a new country as a goodwill conduct for personal reasons. The more serious human smuggling is for monetary and other considerations as a deal. Human smuggling can affect a nation's military and border security issues. There can also be human smuggling in the guise of legal migration.

Human trafficking will involve deceit, force and coercion. Often, the third-party coercion continues over the subjects by force even after they are trafficked. The victims are mainly women, children and prospective militants. The purpose is economic exploitation as sex workers, bonded labourers, militant criminals, etc. The income continues to flow to the trafficker from the earnings of their victims who often end up in extreme trauma. Rehabilitation of such people also becomes an additional burden to the nation. More than 50,000 women and children are trafficked out of Nepal and Bangladesh every year into India and Pakistan according to a report of the United Nations' International Children's Emergency Fund (UNICEF).⁴⁸ They ultimately end up in the ever-expanding and demanding sex trade. Sex traffic is based on demand and supply. The demand never stops. It is ever increasing. The sex traffic will only increase unless international governments and organisations take serious measures.⁴⁹ Human trafficking is one of the reprehensible and perhaps the

⁴⁸“Women Trafficked into India.” *Hindustan Times*, New Delhi. 23 September 2004, p. 23.

⁴⁹“Sex Traffic, Part I.” Channel 4 (London), 14 October 2004.

most heinous crime of the modern world. The victims are vulnerable to abuse and exploitation and unable to seek aid from humanitarian agencies or their own governments since they are captive to the syndicates who operate the trade. Subjects of smuggling and trafficking often undergo traumatic experiences while transported and after landing, most of the time, in intermediary landing places.

Human smuggling and trafficking has a big part to play in militant activism. Smugglers and traffickers of all commodities have patronised many routes world-wide over land, sea and air. For them, the borders are just lines drawn on the map.⁵⁰ The traffic routes are all over the world, and the human movement is a never-ending stream. The vows of the subjects are often difficult to perceive. The boat crew who transport them by sea often force the women passengers to sleep with them and provide sex. They rape the hapless illegal migrants who refuse. Illegal human trafficking is an organised crime in many countries. Where it occurs, the neighbouring countries become staging boards. It is a collateral issue for such countries. People of distant lands pass through them, not as tourists, but as prospective prostitutes, maids, cheap labourers, mercenaries, child labourers or often as se commodities of rich and prospective pedophiles, etc. Some of them die locked in airless trailers or containers or simply by the vagaries of weather on their way in search of their dreams.

Often, the illegal migrants by sea are called the boat people. They use the sea as the most convenient form of passage to perceived prosperity. Their stories are laid with trauma and tragedy at the end of it. A rickety small boat that hobbles across the oceans with prospective illegal immigrants to a better country could easily breakdown at sea. There are many poignant cases of such breakdowns. Men, women and children scramble for the mercy of God under such situations and often die of starvation and dehydration. There were incidents when women were forced to breast-feed others to survive. Under extreme circumstances, people even negotiate eating part of the dead to survive. The desperation turns violent at the refusal to accept suggestion by other survivors. People are sometimes thrown overboard in a rage of fury.

The illegal passengers face many problems. Often they get caught by enforcement agencies. Thereafter, it is a long period in jail. Families get separated. Boats break down or meet with other casualties ending at the bottom of the sea. Women and children get raped. Many are robbed off their money and meagre possessions. Most of them, at the end of it all, become criminals, prostitutes, destitute organ donors, mercenaries and indentured workers. Life often leaves no promise or hope for such people. The United States, the most prosperous country in the world, is a dream destination to many in South America. People from Dominican Republic sneak via Puerto Rico to the United States.⁵¹ In one such incident, in August 2004, a boat

⁵⁰Murphy, B. "Terrorists Use Paths of Human Smuggling." www.casperstartribune.net, 18 August 2004.

⁵¹Baxter, S. "Starving Boat People Forced Women to give Breast Milk." *The Times of India*, Mumbai. 16 August, 2004. p. 11.

carrying prospective migrant workers broke down midway at sea. There were 85 passengers. Fifty-five of them died. Each one had paid around US\$350 for that trip to the agent. The boat sailed from the coastal village of El Limon in Dominican Republic. The 30-foot boat developed engine problem after 2 days. It was a local *yola* without seats or covers.⁵² The captain and crew called out to another boat and escaped with a promise to return with help. They never returned. People were in frenzy. They forced the women to breast-feed them. A woman who refused to breast-feed other survivors was thrown overboard. Some passengers jumped out of the boat unable to face heat and hunger. A woman of 19 breast-fed at least eight people. They took turns to suck on her nipples shoving like puppies. Another who was forced to feed at least a dozen people died, while two others were draining her breasts to survive. Eight passengers died in the hospital after being rescued. All these women had left their babies with relatives at El Limon before they took the cruise to destination hell.⁵³ The force of demographic dynamism can withstand anything in a restless and agitated world.

On the average, more than 7000 Dominicans are stopped at sea by authorities in a year from entering the United States (2004). The annual figure, it is understood, is ever on the increase in spite of calamities at sea. Inflation in Dominican Republic is 30 (2004). Unemployment is rampant. The US Coast Guard (USCG) has a regular job in blocking the illegal immigrants. In spite of it all, the coast guard says, "they keep coming".⁵⁴ Illegal sea voyages are common in the Americas. People move from where it is harsh to where it is free. A creaky oil fishing boat can carry up to 200 illegal passengers and silently get to the US shores from Ecuador. The voyage is grim, but they endure it against all odds expecting the light at the end of the tunnel. In this voyage they hide in pursuit. The human contraband cargo is shuffled below decks at the sight of a light that flickers in the night on the horizon or the mast or smoke during the day. The captain of the boat is their saviour as well as the agent of death merged into one. They are professional human smugglers who thrive on illegal human trade. They are experts in the business. The illegal immigrants continue to pour into developed countries or other diving board countries defying all security arrangements at the borders. The journey will be by all modes of transportation, with interruptions at different places. It will be an epic saga of torture and wild fury in front of which any of those mythological Greek epics will look pale. There are no gods on the way. Faltering economies are told to be the reason for illegal immigration. It is not exactly so. It is a faltering sense of security in one's own country that could be the reason. Inflated personal aspirations as well play a part.

In the American hemisphere, the business of human smuggling generates US\$20 billion per year. It is second only to drug trafficking. An average fare from Ecuador to the United States is US\$10,000 to US\$20,000. Many prospective migrants disappear en route. Three illegal migrants were found dead from exhaustion after a

⁵²Ibid.

⁵³Ibid.

⁵⁴Ibid.

long trek across mountains and icy temperatures to Slovakia in Vysna Rybnica near Slovak-Ukrainian border in January 2004.⁵⁵ *The New York Times* reported that while the families were not sure whether they would ever see their dear ones once they left home as illegal human cargo, the smugglers and traffickers lived in wealth.⁵⁶ Women suffer more in human smuggling and trafficking. En route they will be pressed for sex by unforgiving crew or henchmen of the smugglers. They travel by sea, tractor-trailers, trucks and on foot. The last one is the most painful part. They will then work as dishwashers, housemaids, sex workers and anything they could put their hands on.

In the case diary of the Indian Coast Guard (ICG), there are entries about a cargo ship MV Medstar.⁵⁷ Fourteen stowaways, later identified as nine Iranians and five Iraqis, boarded the vessel surreptitiously, allegedly paying US\$250 to outside agencies at Bandar Abbas in Iran. The vessel left the port on 8 June 2000. Master and the crew of the vessel noticed the stowaways only when they came out in the open at sea. They threatened the master and the crew and demanded passage to a European port. The stowaways were able-bodied young men proficient in small arms and explosives and well versed with the developments in the world. They were suspected to be aiming to be recruited as mercenaries. The stowaways told the master of the ship that they had placed explosives on board. The master managed to inform the Indian Coast Guard who intercepted the vessel 300 miles off Mumbai around midnight on 11 June 2000. It took 13 days of negotiation before deporting the illegal immigrants to their respective countries and releasing the ship from their hands.

India has its vows of illegal immigration. Entry into India from Bangladesh is a major issue. According to India's former home minister Lal Krishna Advani, no other country is facing such a problem.⁵⁸ This has resulted in confrontations and also harassment to Indians on the border by Bangladesh security forces. Such immigration also can be exploited by anti-demographic agents and activists. Illegal immigrants are also a threat to environment. Bangladeshi illegal immigrants in Orissa, India, who intrude into the nearby Bhitarkanika crocodile sanctuary have become a threat to estuarine crocodiles according to reports.

There is another viewpoint too. While governments and security agencies deplore it, some argues about the moral side of it.⁵⁹ It is stated that freedom-loving people morally support the efforts to smuggle people out of dangerous conditions in which they live to more acceptable locations even if it is another country. In the United States, people had broken law to guide victims of slavery to freedom in the late

⁵⁵ PTI News Scan (New Delhi), 8 January 2004.

nineteenth century. Vigilantes and activists have helped many victims of political and religious subversion to escape to better places and supported them. They smuggled people in the name of freedom and better life. These people felt moral superiority of a higher society. For some, it is an act of liberation. For others, it is just business. For a nation, it is demographic security that has gone astray with cascading effects on other elements of national security. While population may not be a serious problem, losing the bearing of it is a critical issue in national security. Intelligence and enforcement agencies keep track of human trafficking and smuggling but have limitations by international law and absence of treaties and national laws. Europe is a favoured coast for sea-born trafficking and smuggling in humans. There are separate criminal syndicates operating around the world each with its own specialty and criminal expertise. The syndicates are specialised in trafficking different types of people. The smugglers and traffickers often take the route of the organised agencies in their own countries and use nearby states as staging points. They own ships and other vessels purchased at reduced price with least care for safety. Charges are heavy. The charge for a passage to Europe from Sri Lanka is about 2600 US dollars per person (2003). The migrants will be taken to the vessels anchored far away from port limits in small boats. The final destination will be the sea area off the European coasts. Italy is a favoured destination for further movements. These vessels use the sea lanes of traffic (SLOT)⁶⁰ rather than SLOCs to avoid detection.

13.7 Population Trends

A historic announcement on 12 October 1999 declared the reaching of the 6 billion mark in world population. It rose to 6.1341 billion by 2001. The population doubled since 1960. It crossed 7 billion marks on 31 October 2011, in 12 years.⁶¹ It is 7.8 billion in 2019. It is expected to be 9.8 billion in 2050. Everything is estimated; the count changes by source of estimate, but the fact remains that human population is increasing regardless unlike the size of the planet that accommodates them along with other life forms. It is a tough job for an innocent and unassuming planet. Other planets do not have such increasing load syndrome. That is out of the world's life-bearing capacity which only planet earth is endowed with.

What is interesting is that the developing countries account for more than 90% of population growth, whereas it slowed down or almost stopped in Europe, Japan and North America. The world population is estimated to be 8.5 billion by 2050. But the estimates vary among researchers. In another research, it is estimated to rise to 9.3

⁶⁰Paleri. P. (2007). *Role of the coast guard in the maritime security of India*. 2nd ed. Knowledge World. pp. 113–15.

Table 13.4 Population projection—target year 2050

Country	2004 (million)	2050 (million)	Percentage
United States	293 million	420	43
China	1300	1400	10
India	1100	1600	50
Pakistan	111	189	70
Bangladesh	140	280	100
Italy	58	52	(−) 10
Indonesia	220	308.5	40
Russia	143	119	(−) 17
Nigeria	102	307	200

billion.⁶² While the population in developed countries will rise by 4%, in the developing nations, it will be 55%. Asia and Africa will see the largest increases. While there is a contrast in developing nations, there are also cases where nations are heading opposite directions as far as population is concerned.

Currently the talk is on the population prediction for 2050. The United Nations and the United States' census bureaux, statistics from individual countries and data from private researchers are the keys for estimating world population trend. The trend is decline in population in large industrialised nations during the period. The reasons are slow birth rates and new curbs on immigration. The world population is expected to rise by about 50% by 2050. The decline will be most prominent in Japan. It is expected to lose by about 20%. The drop will be seen in Russia, Germany and Italy, whereas the US population is expected to increase by about 43%.

China is estimated to have a regulated increase of 10% and is expected to slip down in demographic count by 2050. India is swelling to become the most populated country in the world with 1.6 billion people on the roll. The rise is almost 50% in that case.⁶³ The trends around the world are given in Table 13.4.

It can be seen that the more poor the country is, the larger the population growth. This statement offers a counterquestion. Can it be said that the larger the population growth, the poorer the country? It is not officially established yet that procreation is the primary hobby of the poor or that they don't play golf, hence having enough time for it and create people of their mould. It is also a doubtful hypothesis that the larger the population, the more gluttonous they become and many are left without food and hence called poor. Research has many ways of establishing conclusions.

It is generally estimated that within a short span of time, more than 50% of human population will live in cities. Or can it be said that the principle of urbanisation when seen from the rear is actually an increase in population density of a specific location? Increase in population also triggers the wandering instinct of the humans. Millions of people are wandering around escaping from persecution, armed conflicts or violence

⁶² Genaro, C. A. "Developed World Population Declining." *The Asian Age*, 18 August 2004, p. 5.

⁶³ Ibid.

in their countries. They are from states that failed in both demographic and ethnic security elements of national security. The number of the internally displaced (ID) is also substantial. Most of them are victims of ethnicity.

13.8 So, What Is Demographic Security?

Demographic security, in this study, is the fifth identified element of national security in the chronological hierarchy of 16 elements. Demographic security, “demosec” in short with the symbol “ d_{s1} ”, is about managing and governing the demographic profile of a nation to the best advantage of the country and thereby to the people.

Demographic security is the overarching human stasis which could end up in the argument whether a force factor or a stress factor in national governance. National security is focus on the people. People are the centrum of a country even when it doesn’t exist physically. Without people there cannot be governance, and governance in a nation is aimed at national security which when percolates to people becomes their well-being. So, demographic security is about managing the population of a country optimally by governance.

Governments will have to find a way of controlling population to optimise productivity. But the anteforces will be an issue to handle it. Transforming the anteforce to productive national security force will be the challenge of governance in demographic security.

13.8.1 *Definition: Demographic Security*

Against the background of this study, demographic security means “the capability of a nation to productively optimise and govern its entire population internal and external to the country at any given time and also the future generations in a sustainable manner by investing people towards maximum productive returns, perfectly aligned with the other elements of national security and integrated with all the terrains of national governance”.

13.9 Summation

In this chapter, the views expressed on population growth are not negative. Instead, it is preferred to assert positively that people can be used strategically by effective investment for maximising national security. There are many ways of it, though not explored in this book. It is left to the governments. The discipline for understanding the subject is HIM (human investment management) that considers humans as

investment instruments (capital), not as resources, from national security point of view.

At the end of it all, like the question before, “How much land a nation needs?” is the basis of asking, “What is the optimum population for a nation under identified standards?” It is a highly debatable issue. But it is a legitimate question though idealistic that will not only answer the first question but also provide ideas for regulating population both ways. It will depend upon the envisaged strategic aspects of human investment that considers population is power. Demographic security balanced with human investment management with the tacit approval of the people of a nation is ideal for demographic security maximisation. As in any other case where people are involved in collective action towards common objectives, demographic security will depend upon people’s total participation. It is idealistic to desire so. The question of optimum population cannot be answered unless the government can get the support of all the people which may look absolutely impossible in a system defined by singularity with differentiability running parallel at any time. But it may be possible under effective national security strategy appropriate to the nation and the situation the government is in.

14.1 Introduction

Once upon a time, it was said that there was a perfect place on earth. It went down in the ocean, never to be seen again. Whether fact, myth or parable of virtues that can only be attempted to attain but never reachable by humans, it stood for everything that was ideal for a human system to live, multiply and survive. The fact that the tale is smudged in awe and fantasy is in this sentence itself. It is a myth which will have traces of truth in it like traces of nuts in a plain dark chocolate. It was said and accepted by all that there was not another land with similar virtues in the world. A myth originates from legend, a legend from history and history from immediate information, information from data and data from facts and facts from truth, the

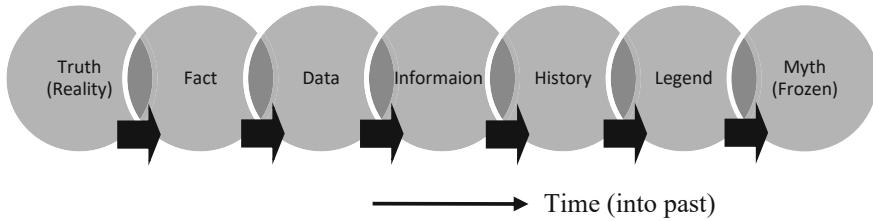

Fig. 14.1 Transformation of truth to myth by distortion in human perception as time passes

reality (Fig. 14.1). That is the story of sapien time. It winds through distorted truth shrouded in memories. The myth ultimately gets frozen in the space-time dimension, all relative to human intellectual perception.

Yes, there was this Neverland¹ of sorts. The land was told to be somewhere in the Mediterranean though diehard explorers see it everywhere including Antarctica, even today. The land was considered morally, socially and politically balanced and stable, the ideal of the idealist world—something that cannot happen within the common wisdom, but happened, because myths need facts to form around like the micro grain of dust for raindrops to condense on. Plato² (427–347BC), the Greek scholar and philosopher, student of Socrates³ (469–399BC), teacher of Aristotle⁴ (384–322BC), teacher of Alexander III of Macedonia, wrote about it—an island of five stades⁵ diameter that was surrounded by several circular structures, concentric circles, some consisting of earth, others water. It was a paradise on earth. Generations of people lived there under the primacy of law in absolute weal. It was known

¹Neverland is a fictional island featured in the works of Scottish novelist J. M. Barrie (1860–1937) and those based on them. It is an imaginary faraway place where his mythical characters Peter Pan, Tinker Bell, Captain Hook, the Lost Boys and others lived. Neverland was also the name chosen by singer billionaire Michael Jackson (1958–2009) for his private ranch and estate. The term “Neverland” in the chapter is used to amplify the mythical land with none equivalent to it before and after.

²Audi, R. (ed.). (1999). *The Cambridge dictionary of philosophy*. Cambridge University Press. p. 709. Plato’s notion of the observable world was one of imperfect image of a realm of unobservable and unchanging “Forms”. His idea of best life was one centred on the love of these divine objects.

³Ibid. p. 859. Socrates was the exemplar of the examined life. According to him only such a life is worth living. Because of his preaching, he was arrested, tried and convicted to death, all in a single day. The punishment was administered by means of poison, probably hemlock. He was charged for refusing to recognise the gods of the city and corrupting the youth.

⁴Aristotle was the tutor of Alexander the Great. Aristotle recognised three types of intellectual discipline: *productive discipline* that deals with activity outside the agent, *practical discipline* such as ethics that is not separate from the agent and *theoretical discipline* that deals with the truth for its own sake. Ibid. pp. 45, 47.

⁵“Undiscovered Country: Satellite Photos Show Atlantis in Spain”. Editorial, *The Times of India*, Mumbai. 14 June 2004, p. 14. Five stades were roughly 925 miles.

as the Island of Atlantis.⁶ Even today the name sinks in with a sense of subliminal nostalgia.

“At the centre of the island, near the sea, was a plain, said to be the most beautiful and fertile of all the plains. . .there were two rings of land and three of sea, like cartwheels, with the island at their centre. . .”, thus begins Plato’s poetic depiction of Atlantis as it appears in his celebrated dialogues *Timaeus and Critias*⁷ written more than 2300 years ago.⁸

According to the stories, Atlantis was a city in front of the Pillars of Hercules—the modern Straits of Gibraltar—that flourished for more than 9000 years. Everything was going well with its people till they became greedy, wicked and impious with avarice. The thirst for unlimited power gained upper hand in societal behaviour. That was when gods intervened, as it was told. The sea swallowed the entire society within a day and a night when a powerful earthquake and a volcanic eruption shook the paradise. The earthquake caused massive ocean waves (tsunamis) that engulfed the island in no time. According to Plato’s version, all these happened 12,000 years ago. Mediaeval Arab geographers believed in the story of Atlantis, and later writers tried to identify it with an actual country.⁹ If it was not fiction created by Plato, it may point out to a volcanic eruption on the island of Thera about 1500 BC according to Egyptian records. This eruption was accompanied by a series of earthquakes and tsunamis that shattered civilisation on Crete, thereby perhaps giving rise to the legend of Atlantis.¹⁰ Curious archaeologists and mysterious psychics, who followed the description of the island passionately, located what looked like its remains in various parts of the world in the past: in Sweden, Palestine, Central Asia, Crete, Carthage, Mexico, the Bahamas, Italy, India and even Antarctica—almost everywhere on earth.¹¹ The belief in Atlantis is too strong. The believers are still looking for it.

Atlantis continues as one of the worlds’ enduring mysteries and an example of a perfect state. It is still the ideal world impossible to be recreated. Thomas More¹² (1478–1535) in his book *Utopia* (1516), a novel brought the concept of such a state into the open. Today, utopia is a word synonymous with something impossible—an idealistic dream. More fashioned it from the Greek words “*ou*” (not) and “*topos*” (place). It meant “nowhere” suggesting such a place, where everything is perfect, is

⁶Encyclopaedia Britannica, Ultimate Reference Suite, CD-ROM, 2004. Arab geographers believed in the story of Atlantis. Later writers tried to identify it with an actual country. The story of Atlantis, if real, may in fact reflect ancient Egyptian records of a volcanic eruption on the island of Thera about 1500 BC. This eruption, one of the most stupendous of historical times, was accompanied by a series of earthquakes and tsunamis that shattered civilisation on Crete.

⁷Ibid. In *Critias* Plato supplied a history of the ideal commonwealth of the Atlanteans.

⁸“Undiscovered Country: Satellite Photos Show Atlantis in Spain”. Editorial, *The Times of India*, Mumbai. 14 June 2004, p. 14.

⁹Encyclopaedia Britannica, Ultimate Reference Suite, CD-ROM, 2004.

¹⁰Ibid.

¹¹Veber, M. (1982). *The world’s last mysteries*, The Reader’s Digest Association, Inc. pp. 12-27.

¹²Sir Thomas More was an English politician, scholar and writer.

impossible to find.¹³ If utopia is synonymous to an ideal human system where people live in perfect conditions, then Atlantis was one such system. Heading towards an objective, even if drenched in idealism, has realism embedded in the efforts. That makes the efforts pragmatic with determination. The question is, “What are the conditions and what prevents in attempting to achieve the utopian system?” Whatever the conditions and obstacles may be, there will be unusual demand for dynamism to overcome difficulties. Breathing dynamism into a static philosophy is better governance rather than dispersing it as non-functional and idealistic. Without dynamism, activities cannot be in motion.¹⁴

But what interests this study is the concept of the unachievable perfect system and the way Atlantis along with its human system was destroyed. It is believed that the close to utopian settlement was ultimately destroyed by ravaging floods between 800 BC and 500 BC.¹⁵ The clue is in this statement. The cause was the cascading effect of killer disaster incidents—earthquake, volcanic eruption, tidal waves (tsunamis) and floods, all in a series within a day and a night. There was nothing strange about such disaster incidents. Obviously, the Atlanteans did not foresee them. They did not have the means to understand the dynamics and destructive powers of natural disaster incidents. There was no early warning system in place. The city did not cater for disaster security. It was obliterated in a single stroke by compound disaster incidents. The storytellers blamed it on the people whom the gods punished. Is the world any wiser today? Whether Atlantis was a myth or utopia was an idealistic concept, similar stories of idyllic states existed in many parts of the world in parables and stories.¹⁶ The idea was there. Whether it was a desirable state of governance or a message on the ethical values of life is a question that could be debated.

The case of Atlantis can only be proven in the reverse order under the law of invariance. There were similar narratives of similar incidents subsequently. Pompeii (79 AD)¹⁷ and Krakatau (Krakatoa)¹⁸ are examples. If such volcanic eruptions and subsequent destruction were true and factual as per the narratives, then under the law

¹³ Encyclopaedia Britannica, Ultimate Reference Suite, CD-ROM, 2004.

¹⁴ Ibid. It is not that utopia was dismissed as an absurd idea. There were many attempts by various groups to establish utopian communities, especially in the Americas. After the Civil War, the enthusiasm for secular utopian experiments waned. Utopian ideology always remained in literature most of them as satires.

¹⁵ “Undiscovered Country: Satellite Photos Show Atlantis in Spain”. Editorial, *The Times of India*, Mumbai. 14 June 2004, p. 14. The research conducted by Rainer Kuhne of the University of Wuppertal in Germany was published in the archaeology journal *Antiquity*. In the research, satellite photos of a salt marsh region known as Marisma de Hinojos near the city of Cadiz shows two rectangular structures in the mud and parts of concentric rings that may once have surrounded them.

¹⁶ For example, there were no known advanced civilisations in the world 12,000 years ago unless the world has not figured out Plato’s calculation.

¹⁷ Pompeii is a city in southern Italy’s Campania region overlooked by the active volcano at Vesuvius. It’s known for its ancient city, Pompeii, which was buried by the 79 AD eruption of Mount Vesuvius. Ruins here include the frescoed Villa of the Mysteries and the city’s amphitheater.

¹⁸ The most notable eruptions of Krakatoa (Indonesia) culminated in a series of massive explosions over 26–27 August 1883, which were among the most violent volcanic events in recorded history.

of invariance, Atlantis could also be factual under the law of invariance and many more such indents pre-Atlantis.¹⁹

But in the study of disaster security, volcanic eruption is only one incident that could cause a disaster. There are many.

14.2 Disaster Security: Setting

Everyone knows what a disaster is; that's what one thinks. People know a disaster can strike anytime, anywhere. Disasters leave behind trauma and anguish in a human system, modify individual and collective behaviour of people and alter their habitats and behaviour sometimes permanently. Disaster has no respect for human boundaries. It can go over national borders without permission. The agony would be reduced if the adversities are prevented or, at least, contained. It is a daunting task for governments to find sustainable mechanisms to meet humanitarian needs during disaster situations. No part of the world is free from disasters of some sort or the other. Some are fortunate to live in a comparatively low-risk environment or geographical location. But they are rare from disaster per se. In the open world, even geographical insularism may not be a sufficient protection from disasters. It means a disaster scenario can reduce national security to an alarmingly low level in moments.

It is against this background that, at the macro level, disaster security has to be appreciated. A disaster occurs when an incident causes serious and sometimes irreversible damage to life, property and environment. Disasters impact national governance and thereby national security. In this context, it is wrong to presume for any government that a disaster will occur without warning. Every disaster can be forewarned—at least to the level that could happen with respect to a nation. One has to turn around and see. A nation that has nuclear reactors around can expect a burnout in a China syndrome, an attack from a militant outfit, a serious accident, tsunami washout, anything. Therefore, precautionary measures and disaster contingency plans must be in place. A coastal state with a large traffic of oil tankers close to its coast can expect a marine casualty that may spill a huge quantity of oil and damage the fertile sea, intercostal areas and underground water tables. The damage caused by such a disaster may last for many years. An earthquake-prone location can always expect a big one at any time disrupting the progress of life at unforeseen times. A tsunami is an untiring and audacious visitor. It will repeat its visit however inhospitable the people were during the first visit. An avalanche does not choose the time to bury people in the valley down below by the force of gravity. A country that is a target for militant activism can expect a showdown without warning. A pandemic can sweep any time exponentially extinguishing life en route. A snowy mountain can bury a town in the valley down. The cook in a ship can cut his finger

¹⁹This argument is a hypothesis. Not examined in detail.

while chopping vegetables that can collaterally burn an oil production platform completely to the stakes far out at sea along with the transfer helicopter on the pad killing many on the platform, that too in pouring rain.²⁰ There are many more. . . just waiting. Any responsible government will be able to visualise a disaster early. What is not known in most of the cases, perhaps, is the time when it will strike. Disasters do not believe in holidays and vacations. The time the disaster will strike is only secondary information in disaster management, because disaster security management deals more with prevention and pre-emption than response. Post-disaster activity is different from prevention and pre-emption. It deals with mitigation of damages, where mitigation means measures aimed at reducing the risk, impact or effects of a disaster or threatening disaster situation.²¹ The primary question is whether the country and its human system is a threat attractor for disasters; if so how serious and what are the types of disasters it can face?

Governing disaster security commences with preventing or pre-empting a disaster where possible. Responding to a disaster, once it occurs, is only incidental to it. Because disaster management today comprises preventive and pre-emptive measures and preparedness to respond in the event of a disaster and techniques associated with response and mitigation. Disaster security governance accordingly begins with preventive or pre-emptive methods to avoid disasters totally or, at least minimise, the damage a disaster can cause to national security. Preventing or pre-empting a disaster is an art that needs to be developed constantly. Often disaster management is considered to be post-disaster relief operations. It is an absolutely incorrect perspective.

So what is a disaster? It is not the incident per se for national security governance. The Disaster Management Act, 2005, defines disaster and disaster management applicable to disaster security governance of India quite aptly²² (Box 14.1).

Box 14.1: Disaster and Disaster Management: Definitions

The Disaster Management Act, 2005, of India defines disaster and disaster management in Chapter I, Sections 2 (d) and 2(e), respectively, as follows:

- (d) “disaster” means a catastrophe, mishap, calamity or grave occurrence in any area, arising from natural or manmade causes, or by accident or negligence which results in substantial loss of life or human suffering or damage to, and destruction of, property, or damage to, or degradation of,

Box 14.1 (continued)

environment, and is of such a nature or magnitude as to be beyond the coping capacity of the community of the affected area;

- (e) “disaster management” means a continuous and integrated process of planning, organising, coordinating and implementing measures which are necessary or expedient for—(i) prevention of danger or threat of any disaster; (ii) mitigation or reduction of risk of any disaster or its severity or consequences; (iii) capacity-building; (iv) preparedness to deal with any disaster; (v) prompt response to any threatening disaster situation or disaster; (vi) assessing the severity or magnitude of effects of any disaster;

For this study, disaster is simplified as the incident that causes loss and damage to life, property and environment, subject to the definition given under the national and international laws relative to the situation and as explained further in this chapter. It is important to understand that the incident is not a disaster unless it causes disaster as defined. It can be appreciated by examining the anatomy of a disaster.

14.3 Anatomy of a Disaster

One of the misconceptions of disaster security is considering the incident as the disaster and naming it accordingly. Disaster doesn't have a name or typology except for convenience classification. Disaster is death, loss and mayhem, all by the forces that go along with human life system environment incessantly as the basic forces of energy system balancing. So it is just one. It is only the anatomy of the incident that matters. The seriousness of a disaster depends on the result of the incident. Life, property and environment when caught in the “incident” suffer loss. That is the anatomy of disaster for human perception and governance. But scientists and many others may look at them differently.

Avoiding the incident that has the potential to cause disaster to humans directly or indirectly is the ideal prevention. The incident becomes a disaster only when it causes serious damage to life and property causing trauma and distress to people. The anatomy of a disaster is viewed more from the need for preparedness than the techniques of response. A high degree of preventive and pre-emptive preparedness is essential for a nation in identified disaster areas to deflect them if possible and, if not, to engage them to minimise damage. That is containing the damage associated with a disaster in an enviable manner by effective disaster security management, in other words, by maximising disaster security. The incident can occur, but it becomes a disaster only when it affects human system disastrously. The damage to human system is what matters. This is important to understand.

The anatomy of a disaster lies in the reductionist principles of a process where small changes produce small effects and large effects are calculated or foreseen by summing up many such small changes beforehand. Mathematicians use the term differential equations for this calculation. It also involves probability theory to allow for chance-induced variables. Chance, coupled with differential rates of change in a system, perfectly prepares the anatomy of a disaster. Disaster is disorder that can be visualised beforehand. It is done every day by everybody in normal but mostly unnoticed situations—like hitting a tennis ball at the correct time and angle; serving a dish carefully without spilling over, etc. A small change in the calculation can cause a disorder—a disaster per se. There can be disasters whose anatomy is nonlinear—an earthquake, for example. The calculation can take a person to an alternate reality. In a nonlinear equation, a small change in one variable can have a disproportionate or even catastrophic impact on other variables. The variables may approach linearly till such time a small change can break the critical threshold when the entire building collapses. This happens in an earthquake, flash flood or gas leak.

There is no standard official definition for a disaster. Dictionary meanings also vary. According to Webster's Dictionary, a disaster is "a grave occurrence having ruinous results".²³ Encyclopaedia Britannica Dictionary states "a sudden calamitous event bringing great damage, loss, or destruction".²⁴ World Health Organization (WHO), the special agency of the United Nations (UN) responsible for international public health, defines disaster as "any occurrence that causes damage, economic destruction, loss of human life and deterioration in health and health services on a scale sufficient to warrant an extraordinary response from outside the affected community or area". It is as close as the definition can get in legal terms because disaster is a health subject (well, is it?) since life and death are involved in it. In that case it will come close to the element of health security besides others. Otherwise it may waltz with economic security. Ultimately it is about loss of life, property and natural environment impacting on the sustainability of life. The viewpoints about a disaster changes with respect to the way it affects a person. All the time, it is post incident. Generally, it is the author's observation that the governments and people are indifferent to a disaster pre-incident unless it is imminent and flooded by warning messages. It is conspicuous on the flurry and flutter once the disaster unfolds as much as by their absence prior to it. The calm before a disaster is a sign of the absence of disaster management in governance. So, disaster management has become firefighting of sorts with ample blame throwing by involved and interested parties besides various other governance deficits and abuses. It could also be seen in the capacity of disaster management organisations in terms of expertise and capabilities in handling disasters around the globe. Often disaster management ends up in governance disasters. The incompetence of governments will be visible in the over dependence of military and other armed forces in disaster management.

²³Parasuraman, S. and Unnikrishnan. P.V. (eds.). (2000). *India disasters report*. Oxford University Press. p. 3.

²⁴Encyclopaedia Britannica, Ultimate Reference Suite, CD-ROM, 2004.

While redefining a disaster with respect to national security, it is important to understand that disaster impacts human life destructively. Disaster causes injury or death and damage to property and natural environment. Environmental security is an element of national security. In that case the definition may not cover environment specifically, especially when the effect of a disaster extends to other elements of national security, such as demographic security.

An acceptable definition for a disaster relative to national security, therefore, can be “an incident of disorder that occurs suddenly beyond a critical threshold causing extreme damage directly or indirectly to life, property or both, and collateral damage to specific elements of national security”.²⁵ Currently, disasters are seen under this definition in only the geophysical terrains. But disasters in other terrains cannot be ruled out in the course of time.

A disaster can be appreciated from the distress it causes to human system. Disaster is a threat that is not just terrestrial. Earth had faced extraterrestrial threats before and can still face it in the future when a space object streams to it. From national security or global security point of view, the earth is to be treated as a target. When there is a cross-border disaster, it could be a primary disaster, such as an earthquake, heat wave, flash flood or avalanche, or secondary in the case of shifting forest fire smoke, a tsunami caused by an undersea quake or oil migration into water tables subsequent to a spill at sea.

14.4 Classifying Disasters

Disasters cannot be precisely differentiated. Their causes can be separated and typified. Disaster occurs when there is loss of life, property and environment due to an incident. The incident may be unusual or common under the laws of nature. But attempts are made by scholars and experts to classify disasters by the incident and the nature of the causes for convenience of expression. That means an earthquake is taken as a disaster even when it is a natural geological occurrence. This is convenient typology. The editors of India Disaster Report preferred to classify disasters as natural disasters, human-made disasters or other disasters.²⁶ These disasters are again subdivided into major and minor disasters, though there is no separate yardstick to identify them that way. The difference between them is marginal. Such assessment should be based on the impact of a particular disaster at a particular time. Even in a major disaster, casualty in terms of lives and properties can be contained by effective mechanisms. A similar incident can cause more casualties in a

²⁵This definition is for academic and scholarly purpose for research and education in the study of national security. But any activity subjected to an act of law should follow the definitions as specified in the act.

²⁶Parasuraman, S. and Unnikrishnan, P.V. (eds.). (2000). *India disasters report*. Oxford University Press. p. 4.

particular country than in another. Therefore, the question in disaster management is whether one looks at the incident or the casualty as disaster for decision-making. Obviously the modern method should be the casualties since zero tolerance to casualty should be the ultimate objective. Zero tolerance is to disaster, not the incident that causes it though it will become part of the interventions. Pulling the person off the railroad is obviously better than pushing the loco off.

The incident of disaster (INCDIS or Incdis) is not the actual disaster. The disaster may be known by it. Every disaster will involve a trifecta²⁷ contribution in percentage by nature, human and chance. The disaster is normally combined with the incident of disaster which has the higher trifecta contribution. This assessment is recommended for governing disasters. While the contributions of nature and humans can be appreciated, the inducement of chance is a mystical paradigm. But it is there. In the examination of the typology of disasters, these are marked separately as nature-induced disasters, human-induced disasters and chance-induced disasters though a disaster will contain all the trifecta in differing percentage including zero. The disaster is attributed to the primary trifecta (nature, human or chance) with recommendations that the contribution of each may be seen separately for governing disaster security.

14.4.1 Nature-Induced Disasters

Nature-induced disasters (NID) are those caused primarily by the imbalance in nature. They include earthquake, volcanic eruption, tsunami, flood, drought, famine, cyclone, avalanche, landslide, heat wave, cold wave, tornado, hailstorm, epidemics and pandemics, impact of extraterrestrial objects, etc. While in the beginning it was nature alone that caused them, there are evidences that many of the human-induced actions act as catalysts for their recurrence in the world today.

Incidents that contribute to natural disasters are actually the balancing forces of nature continuing since the beginning of all of it.

14.4.1.1 Earthquake

Earthquake is a perpetual threat. The earth may tremble any time because the planet is in an agitated mode at all times underneath. An earthquake is the shuddering of the earth's surface resulting from a sudden release of energy in the lithosphere deep under. Resulting seismic waves travel to the surface shaking up everything there. There can be other causes too for an earthquake, such as a live nuclear test, volcanic

²⁷ Trifecta is a bet in which the person betting forecasts the first three finishers in a race in the correct order, a run of three wins or grand events "he will attempt a trifecta of the long jump, triple jump, and 110-m high hurdles".

eruption, meteor impact, landslide, etc. Scientists soon hope to find a way to bring earthquakes within the predictability range.²⁸ The cause is tectonic shift under the surface on which the continent masses settle. There are about 12 major tectonic plates around 100 km thick that move around carrying the life habitats over them constantly.²⁹ Experts divide them into major, minor and micro plates.

Earthquakes in its original sense occur when the plates collide³⁰ as well as when stress accumulated along geological faults is relieved. In scientific terms, the quake occurs when earth releases energy suddenly. The earth may feel relieved after the burst, like a good fart, but a quake wreaks unparalleled havoc resulting in disasters by loss of life, property and environment besides injuries to human. Earthquakes have destroyed human systems in what the historians call civilisations causing millions of deaths and incalculable damage to property in the past. The geophysical environment gets rebooted in an altered manner after a quake. Damages caused by an earthquake depend upon terrain utility, demographic density and topographic characters. A severe earthquake is usually complicated and depends on the topography and nature of surface materials; they are often severer on soft alluvium and unconsolidated sediments than on hard rock. Cataloguing of earthquakes has been an old practice to statistically arrive at its next occurrence. An earliest and very extensive catalogue of this kind is from China. It begins about 700 BC. The catalogue contains some information about 1000 destructive earthquakes. The sizes of these earthquakes have been assessed from the reports of damage and intensity.³¹

There are three major earthquake belts in the world. They coincide with the margins of tectonic plates. One passes around the Pacific Ocean. This belt affects coastlines bordering on it: those of New Zealand, New Guinea, Japan, the Aleutian Islands, Alaska and the western regions of North and South America. An estimated 80% of energy released in earthquakes comes from those whose epicentres are in this belt. The second belt goes through the Mediterranean region eastward through Asia and joins the first belt in the East Indies. The energy from this belt in the earthquakes is about 15%. The third belt connects activities along mid-oceanic ridges—including those in the Arctic Ocean, the Atlantic Ocean and the western Indian Ocean—and along the rift valleys of East Africa.

About 20,000 earthquakes are noticed or experienced annually all over the earth.³² That is rocking around 50 times a day. This actually shows the planet is constantly on dynamic vibration. There is no way to damp the planet. But the structures on it can be isolated or damped. Some of the major earthquakes of the

world, taken at random, are given in Table 14.1. It will be interesting to see them in terms of disaster seriousness. It has to be not by magnitude but by loss of life and property, injuries to people and damage to the environment. Disaster seriousness is a key factor in deciding disaster management not the force of the incident.

Earthquake is measured quantitatively in Richter scale introduced in 1935 by American seismologists Beno Gutenberg (1889–1960) and Charles Francis Richter

(1900–1985). Relatively weak earthquakes that had been detected up to that time were assigned scale values close to zero, and the scale was arranged so that each increase of one unit represented a tenfold increase in the magnitude of an earthquake (i.e. the numbers on the Richter scale are proportional to the common—base 10—logarithms of the magnitudes). More sensitive seismographs can detect earthquakes even fainter than the ones that were originally chosen to define magnitude zero; their magnitudes are accommodated on the Richter scale by the use of negative numbers. Although the scale has no theoretical upper limit, the largest earthquakes have not exceeded a scale value of 9 beyond decimals. The scale was refined by Richter and Gutenberg to remove the restrictions of distance and type of seismograph used.

The most serious earthquake in terms of a disaster, according to this study, need not be the most powerful one. The most powerful earthquake was the Valdivia quake in Chile in 1960. It had a force of 9.5 in Richter scale. It created a Tsunami and together killed an estimated 5700 people. But the 1556 earthquake in Shaanxi, China, was of maximum disaster seriousness so far in which an estimated 830,000 people lost life. The magnitude was less about 8. Damage extended as far away as about 270 miles northeast of the epicentre, with reports as far as Liuyang in Hunan, more than 500 miles away. Geological effects reported with this earthquake included ground fissures, uplift, subsidence, liquefaction and landslides. Most towns in the damage area reported city walls and houses collapsed. Many of the towns reported ground fissures with water gushing out.

14.4.1.2 Volcanic Eruption

A volcano has its roots deep inside the boiling earth where the earth is coping with its evolutionary thermal stability. They are events on earth's surface through which molten rock, pyroclastic debris and steam escape violently. In this process, ashes are hurled violently into the atmosphere. Volcanoes could also be a landform created by solidified lava and accumulated solid debris. The planet may seek a root canal therapy from a seismic dental surgeon. But that could be dangerous. It may explode the planet, one doesn't know. The destructiveness of volcanoes is awesome. The risk can be minimised by assessing volcanic hazards and forecasting volcanic eruptions. The explosive eruptions can affect climate and cause serious climate change many times more than what humans can induce.

There are many submarine volcanoes under the ocean. Most of them are at shallow depths. Undersea volcanic eruptions of serious magnitude are experienced in Hawaii, Indonesia and Japan. There are reports (2004) that rumbling earthquakes are experienced under the volcano Mauna Loa in the Big Island in Hawaii which may erupt for the first time in 20 years.³³ The prediction could be the first of its kind

³³PTI News Scan, New Delhi.13 September 2004.

1991	Philippines (Mount Pinatubo) (VEI 6) (722)

^aCompiled from various open sources. Casualties are estimates and subject to variation

if it becomes true. Table 14.2 gives random details of disaster caused by volcanic eruptions with VEI.³⁴

Volcanic explosiveness is measured in volcanic explosivity index (VEI) in a scale of 1–8 according to seriousness. The level of an eruption is based upon the volume of products, eruption cloud height and qualitative observations. A value of 0 is given to non-explosive eruptions.

According to geologists, the strongest explosion ever witnessed was that of Thera (1610) in Aegean Islands (Greece). The island was believed to be Santorini. There are no records of it, but the energy released was equated to several “atomic bombs”. It would also have been the most serious if it was linked with the mystery or the mythopoeian legacy of Atlantis. Volcanoes cause collaterals such as earthquakes, tsunamis and climate alterations (sulphur oxide clouds). In recent times the strongest and most damaging was Mount Tambora (1815). It was recorded.

There was no eruption of VEI 8 magnitude. It is believed that Lake Taupo in the North Island of New Zealand was formed by one such eruption about 26,500 years ago. It would have been more a natural process of terra balancing than a disaster with loss of life and property.

14.4.1.3 Tsunami

Catastrophic ocean waves of high amplitude that hit distant coastal areas with powerful energy gathered while in motion were generally known as “tidal waves”. These waves cause heavy damage by inundation of the area. They can virtually wipe

³⁴Volcanic explosivity index. VEI is the relative measure of the explosiveness of volcanic eruptions devised by Chris Newhall of the US Geological Survey and Stephen Self at the University of Hawaii in 1982.

out islands and low-lying areas. But the term tidal wave is a misnomer. It is not a wave caused by tide. It was also called seismological wave. That too is not an appropriate term since the waves could be subsequent to a seismological disturbance underwater. The wave is collateral to natural or human-induced incidents. Earthquakes, volcanic activities, landslides, meteoroid hit or a nuclear test³⁵ under the sea or near to it can trigger these waves. The wave originates from the point of impact. A closer word to explain such a wave will be tsunami, meaning harbour wave in Japanese (*tsu* means harbour and *nami* means wave in Japanese³⁶). Tsunami, perhaps, is the closest term to explain the phenomenon. The wave starts at the point of impact in the ocean and becomes a killer by the time it reaches the shore wading through shallow waters. It hits the shores with a force of extremely high magnitude inundating the land in its reach, deepening the coastal waters in most cases and flattening the land and structures depending on the acquired force. The wave could be a hundred nautical miles long from crest to crest or trough to trough and move at a speed of about 500 knots (nautical mile per hour). When it reaches the shallow waters, it rises up to an unbelievable height. It is like a locomotive derailing at 900 kmph. That is very powerful.

The eruption of the Indonesian volcano Krakatau (Krakatoa) in the island of Pulau³⁷ Rakata in Sunda Straits on 27 August 1883 caused some of the most catastrophic tsunamis in history. The eruption was said to be 3000 times more powerful than the nuclear bomb that destroyed Hiroshima during World War II, but for the radiation effects caused by the latter. The island sank and in its place a new volcanic island came up—Anak Krakatoa meaning son of Krakatoa. It is said an eruption in Anak Krakatoa could be as violent as the original someday.³⁸ The waves induced by the eruption of Krakatoa reached as far away as India's east coast, Britain, South America and Hawaii. Thirty-six thousand people died in the nearby coastal areas by a series of tidal waves, whereas death in the island was primarily due to volcanic eruption. The tsunami changed the geographical profile of the region over the surface and under the sea. It was considered to be one of the catastrophic events that changed the world.

A more recent earthquake occurred at 6.28 am (IST) on Sunday, 26 December 2004, the day after Christmas off the coast of Sumatra, in Indonesia, very close to the Aceh province. The earthquake that measured 8.9 (9.2 as per the US Geological Survey) in the Richter scale triggered off powerful tsunamis that hit the coastal areas

³⁵Such nuclear tests are no more carried out as in the past. They are banned under the Comprehensive Nuclear-Test-Ban Treaty (CTBT) adopted by the UN General Assembly (UNGA). CTBT is multilateral and bans all nuclear explosions for both civilian and military purposes, in all environments 10 September 1996 but has not entered into force, as eight specific nations have not ratified the treaty. They are China, Egypt, India, Iran, Israel, North Korea, Pakistan and the United States (06 May 2020).

³⁶“Tsunami waves”. *Sainik Samachar*. 1-15 January 2005, p. 2.

³⁷Meaning “island” in Bahasa Indonesia.

³⁸Paleri. P. (2007). *Role of the coast guard in the maritime security of India*. 2nd ed. Knowledge World. pp. 117–118.

of 15 countries on the Indian Ocean Rim (IOR): Bangladesh, India, Indonesia, Kenya, Madagascar, Malaysia, Maldives, Myanmar, Seychelles, Somalia, South Africa, Sri Lanka, Tanzania, Thailand and Yemen. The tsunami killed, injured, mislaid and displaced 2.5 million people. Death toll alone was estimated 227,298.³⁹ A million people were affected in Sri Lanka alone. Landmines floated and sank into the sea in the then insurgency-torn northeastern Sri Lanka. A toxic waste dump was hit in Somalia causing illness among people. The dump was a cheap disposal site for heavy toxic wastes from industrialised countries created at an extremely low cost taking advantage of lack of government in Somalia in the 1990s. In Thailand, people saw the sea being drained off before the devastating waves hit the coast. In India, the geographical profile of the Andaman and Nicobar Islands changed. Tamil Nadu, India, had experienced a tsunami attack in 1941 due to an earthquake in the Andaman and Nicobar islands.⁴⁰ Close to the tsunami of 2004, it was reported that there was an earthquake in Tasmania caused by a shift in the Indo-Australian tectonic plate. The shift probably triggered off the Aceh earthquake.⁴¹

The history of killer tsunamis dates back to the ancient world, even if the ancient story of Atlantis is considered mythological. Table 14.3 gives some of the serious tsunamis.⁴²

There are volcanic islands in the seas that can cause giant tsunamis across oceans.⁴³ Scientists predict another tsunami that may kill about a million people and devastate the shores of Britannia and the east coast of the United States among others when the volcano Cumbre Vieja at Las Palmas in Canary Islands is triggered. It is part of the Gee-Gees, the way the scientists call the danger spots of natural disasters that are geophysical events. The volcano erupts at intervals of 20–200 years. The last was in 1971. The next eruption is likely to dislodge a 12-mile-long slab of rock that will crash to the seabed causing a dome of water a mile high. The rock is already slipping down by infinitesimal degrees. At the last moment, it will take 90 s to dislodge. The resulting tsunami, at 800 kmph, will reach Britain in 6 h and the US east coast in double the time. The height of waves at the receiving end, according to simulated data, is expected to be 165 feet. Boston, New York and Miami in the United States will be hit and the Caribbean overwhelmed.⁴⁴ Britain had faced a tsunami in the long past. A huge landslide in Norway caused a 75-foot tsunami 7000 years ago.

Table 14.3 Random major tsunamis

Date	Location	Nature of tsunami
1 November 1775	Lisbon, Portugal	The Lisbon earthquake triggered off tsunami. Waves up to 20 feet high hit coastal Portugal, Spain and Morocco. Sixty thousand died
27 August 1883	Indonesia	Krakatau erupted and generated tsunami. Java, Sumatra and west coast of India including Andaman and Nicobar islands devastated in rising flood
15 June 1896	Japan	Seventy-feet-high waves wiped out a crowd gathered to celebrate a religious festival. More than 26,000 died
17 December 1896	California, USA	Devastated Santa Barbara embankment and main boulevard.
31 January 1906	Tumaco, Colombia	Offshore earthquake submerged part of Tumaco, washed away every house between Rio Verde, Ecuador, and Micay, Colombia. Five hundred to one thousand one hundred died
26 June 1941	Andaman and Nicobar islands, India	Widespread destruction in middle and south of the islands, seriously affected Tamil Nadu and other parts on the west coast of India
1 April 1946	Alaska, USA	Earthquake-generated tsunami destroyed North Cape Lighthouse. Hours later the wave hit Hawaii killing 150 people and causing millions of dollars in damage
22 May 1960	Chile	Thirty-five-feet tsunami. One thousand died in Chile. Damages and death in Hawaii. Swept across Pacific and caused damages in Philippines, Okinawa and Japan
28 March 1964	Alaska, USA	Scale 9.2 earthquake and tidal wave caused destruction in three villages in Alaska. One hundred seven died in Alaska. Swept down the west coast and reached Oregon and California
16 August 1976	Philippines	Five thousand killed in tsunami in the Moro Gulf region
17 July 1998	Papua-New Guinea	Offshore quake triggered off a tidal wave that struck Papua, New Guinea. More than 2000 died. Thousand became homeless
26 December 2004	250 km south-east of Sumatra, Indonesia	Worst ever-reported earthquake since 1964. 9.1 on Richter scale. Killed 227,898 people. Affected 2.5 million people in 15 countries in Asia and Africa. The quake changed the map of Asia. Small islands moved as much as 20 metres

The biggest tsunami so far is considered to be the one that hit Lituya Bay, Alaska, USA, on 9 July 1958. The run-up height of the tsunami was 1720 feet. It is the highest wave that has ever been known. It was caused by an earthquake along the Fairweather Fault in Alaska Panhandle. The 2004 Indian Ocean tsunami remains the deadliest so far in recent times with respect to casualty. But unlike its predecessors in ancient times, it hasn't altered the nearby peninsulas and habitats. One such tsunami originated from the same area supposed to have sunk the illustrious

port city of Poompuhar on the west coast of India in Tamil Nadu in 300 BC. It was a Capital of Early Cholas and the last well-known king who ruled there was the renowned Karikala Chola. The city lost most of its land because of erosion and tsunami around the second century. However no serious research has been carried out to test the hypothesis that the city went underwater subsequent to a tsunami though there are enough linking evidences in the Tamil mythopoeian poem *Silappatikaram*⁴⁵ that narrates the tragic love story of Kannagi and Kovalan, the lovers who lost everything. According to the poem, Kannagi's curse on the death of her husband Kovalan sank the city under the ocean in the ensuing flood after the tsunami.

14.4.1.4 Flood

The fear of water makes humans clasp their land firmly. The land-clasp syndrome makes the humans enduringly tied to the terra firma. Or rather, perch precariously on the rocks in the middle of the roaring ocean around them that are nothing but drying heights in nautical terms. An incremental rise of the water level around them can ring alarm bells. People generally know how to swim and float in water, but they also know that won't solve the problems. The Indian epic *Bhagavata*⁴⁶ narrates a great flood in which the world itself went underwater as a separate entity. The visualisation was at cosmic dimension. According to *Bhagavata*, Lord Vishnu manifesting in the form of a gigantic boar went under the cosmic floods and lifted the earth on its tusks. For humans flood invites disaster and therefore feared as an existential hazard. The Biblical story of the great flood is another example. There are many such narrations where floods have been told to engulf not just human habitats but also their survival aspirations. All these stories indicate floods were very common and spread out as a disaster in most parts of the world from the ancient times itself. These floods were mentioned to have caused by incessant rains that submerged everything on the earth's surface. But there could be floods by the melting of ice already at the polar sectors and mountain tops. The melting is expected to be caused by the heated earth as a result of unprecedented global warming. The effects of floods on human well-being range from soil enrichment to catastrophes.

⁴⁵Written by poet and Chera prince Ilango Adigal (fifth to sixth centuries).

⁴⁶According to Hindu culture, *Bhagavata* or *Srimad Bhagavatam* is written by Lord Sri Krishna himself as his own literary incarnation. It is said that Veda Vyasa meditated on the form of Lord Krishna and received the *Srimad Bhagavatam* in meditation. Then he composed it as per the instructions of his spiritual master Sri Narada Muni. It is one of the 18 *puranas* and is therefore also known as the *Bhagavata Purana*. It is considered to be the essence of all the Vedas. The Vedas are compared to a desire tree because all kinds of knowledge that one may desire are available in them. But *Srimad Bhagavatam* is the ripened fruit of that desire tree because it is giving the highest knowledge of the Supreme Personality of Godhead and the reciprocation of loving exchanges between Him and His devotees according to Hindu belief. The *Bhagavad Gita* is contained in *Bhagavatam* as a concise divine discourse on the battlefield between Lord Krishna and prince Arjuna of the Pandavas.

Table 14.4 Random major floods^a

1935	Yangtze River, China (145,000)
1938	Yellow River dyke, China (800,000)
1953	North Sea, Netherlands (2551)
1971	Red River Delta, Vietnam (100,000)
1975	Banqiao dam failure, China (231,000)

^aEncyclopaedia Britannica, Ultimate Reference Suite. 2004

A serious study will show floods are generally caused by constant rain, storm surge, tsunamis, ice jams, dam bursts, glacier melting and other reasons. In Indonesia, flash floods have been attributed to illegal logging. Flash floods originate without warning as a sudden, unexpected torrent of muddy and turbulent water rushing down a canyon or gulch. It could also be caused by breaching or overflowing of a dam in the neighbourhood. It is uncommon and of relatively brief duration. The suddenness of its occurrence makes a flash flood extremely dangerous. Floods unleashed by tropical storms can kill. Two thousand people were killed in Haiti in a small town when a tropical storm induced flood in 2004.⁴⁷ Table 14.4 gives major recorded floods that have caused heavy casualties and affected the well-being of the people.

The 1931 flood in China is considered to be the worst flood disaster so far. 3.7 to 4 million people were said to have been perished. Does this mean disasters are natural balancers of demography, or is it that disasters are seen where there is heavy population? Both ways an incident becomes a disaster when it causes heavy damage to a human system. Floods are measured for height, peak discharge, area inundated and volume of flow. These factors are important to judicious land use, construction of bridges and dams and prediction and control of floods. Common measures of flood control include improvement of canals, construction of protective levees and storage reservoirs and, indirectly, implementation of programs of soil and forest conservation to retard and absorb runoffs from storms. A flood of such magnitude that is expected to occur only once in 100 years is called a 100-year flood. The magnitudes of 100-, 500- and 1000-year floods are calculated by extrapolating the

⁴⁷PTI News Scan, New Delhi. 28 September 2004.

existing records of stream flow, and the results are crucial to protect vital infrastructure from catastrophic floods.⁴⁸

Flood is also used as a strategic weapon during war. China created the Yellow River flood in 1938 in the middle of the Sino-Japan war when the Japanese troops were moving towards Wuhan. The strategic value of the flood has been questioned. Japanese troops were out of its range, either to the north and east or to the south. Their advance on Zhengzhou was halted, but they took Wuhan in October by attacking from a different direction. The Japanese did not occupy much of Henan until late in the war, and their hold on Anhui and Jiangsu remained tenuous. Most of the towns and transport lines in the areas which were flooded had already been captured by the Japanese; after the flood, they could not consolidate their control over the area, and large parts of it became guerrilla areas.

The biggest flood in the world certainly could be the earliest floods lasting for long durations such as the mythopoeian *Bhagavata* floods (*pralaya*) or the Biblical one. The casualties would have been limited in terms of life and property being in sparse primitive systems. The environment would have been seriously affected, only to change for the future. But the 1931 floods in China are considered to be the deadliest flood ever so far. The estimated casualty is about 4 million people. It was concluded that the floods were primarily caused by poor management of the rivers, which were overwhelmed by extreme weather in 1931. It also shows management of rivers is one of the ways to prevent and pre-empt deadly flood disasters.

14.4.1.5 Drought

Drought is opposite to flood. There is no water. There is prolonged shortage of water supply in an area which otherwise had enough water for cultivation and habitability. The supply of water in an area is through rainfall (precipitation), ground water from the water tables or surface water from rivers and canals. If the flood is caused by incessant rain or ingress of water from elsewhere, the drought is caused by the absence of rain or parching of land as water holes and inlets dry up. Prolonged shortage of water supply causes drought. Drought can also kill, damage properties and emasculate the environment and thereby become a disaster. Drought is the most serious threat to agriculture and habitats in nearly every part of the world. Humans have discovered fire and learnt to control it but are still incapable of creating rain and water sources.

There are different kinds of drought:

- Permanent drought where agriculture is impossible
- Seasonal drought where agriculture must be adjusted during rains
- Unpredictable drought because of unexpected failure of rainfall
- Invisible drought that occurs in summer that results in diminished crop yields

⁴⁸Encyclopaedia Britannica. Ultimate Reference Suite. CD-ROM, 2004.

Table 14.5 Random major droughts^a

Year (starting)	Place Affected population in bracket
1540	Central Europe
1900	India (3,200,000)
1920	India (1,250,000)
1921	China (500,000)
1921–1922	Soviet Union (5,000,000)
1928–1930	North West China (3,000,000)
1936 and 1941	China (3,000,000)
1942	India (1,500,000)
1943	Bangladesh (900,000)
1965	India (1,500,000)
1973	Ethiopia (100,000)
1983	Ethiopia (300,000)
1983	Sudan (150,000)
1997–2009	Australia (nil)
2006–2007	China (8,000,000 affected)

^aWikipedia. Drought. <https://en.wikipedia.org/wiki/Drought>. Accessed 25 March 2020

Draughts can also be typified as meteorological, agricultural and hydrological. Meteorological drought is when rainfall is short; precipitation gradually declines. It creates a chain reaction leading to other types of drought. Agricultural drought is when the crop production is affected. It could also be resulting from shortage of precipitation or poor water management. There are many lakes and reservoirs that are dried out around the world by poor water management and diversion of water. The third type, hydrological drought, is when the surface and substrata water sources dry out or fall below the desired threshold—lakes, rivers, aquifers, reservoirs and so on.

There is a strong relationship between drought and rainfall. As a potential disaster incident, the effect of a drought is varied to the people. The most affected are the static peasants. A parching drought and recurring crop failure bring a spate of suicide waves among farmers in India. This can’t happen unless governance is lethargic and abusive. There are complaints that such suicides provide political advantage in election to the opposition parties. Another pointer is that often money is spent by the government without the deserving getting it. Some of such suicides are honour based and not poverty based. Some of the major droughts in recorded history are given in Table 14.5.

Drought has been a regular feature. But still humans do not have the magic wand to create water in a drought-hit area. DNA research suggests *a series of mega droughts between 135,000 and 75,000 years ago* may have been responsible for the first migrations of early humans out of Africa. Scientists say that variable climate conditions made the land in parts of Africa frequently inhospitable for human habitation. Droughts may have limited access to fundamental resources, forcing inhabitants to migrate outside the continent to find sustenance. Drought also can

spread deadly diseases. The Dust Bowl in the Great Plains of the US Midwest and Canada in the mid-1930s drove 2 million people off the land and led to an *outbreak of diseases*. At the time it was not realised that the dust-transmitted measles, influenza and a fungal lung disease called Valley fever. For people already weakened by malnutrition, these diseases often proved fatal.

The 1928–1930 draught in China is considered to be the most disastrous draught in the world so far. There are other sociological impacts also. The death of the family head is a financial as well as traumatic blow to the family watering a draught-hit area. The girl child suffers more. Immediately it is the turn of the girl child to starve since the money will not be sufficient to buy food for all. Men get preference over women for the meagre food cooked at home. As there is nothing to cover bodies modestly the women of the household do not venture out of their dilapidated huts. Most of the girls are married and disposed of as soon as they reach puberty. Others work as bonded labourers. And worst, many are forced into sex trade in the human traffic.⁴⁹ In fact the entire drought zone turns into a bourse where sex futures are traded soon after. Traders land to bargain and buy off, for trafficking women off to faraway cities of flesh. It is money for all, except the drought victims—all in a single disaster.

“Everybody loves a good drought” ran the title of a book written by a reputed Indian journalist.⁵⁰ The author explains how drought relief is rural India’s biggest “growth” industry. He highlights the issues between relief providing and reaching it to the affected people and how the funds for relief operations are abused. Corruption is a larger calamity. It distorts the disaster relief system in an affected country.

The deadliest drought so far has been the one in China in 1928–1930, but the biggest one perhaps is the Australian drought of 1997–2009 which had revolutionised water management through desalination plants by reverse osmosis in the country.

14.4.1.6 Cyclone

A cyclone, also known as a tropical or subtropical revolving storm based on its position relative to earth, occurs in the ocean. It is a revolving storm over the sea which may make landfall or otherwise before attenuation. It is powerful and can cause heavy damage on its path. Often the coastal areas face its wrath. Cyclones don’t generate within 5-degree latitudes over the equator.

The structure of a cyclone is that of a giant air mass rotating around a strong centre of low atmospheric pressure in a direction governed by the Coriolis effect⁵¹—

⁴⁹Das, A. “Drought Hits Girl Child”. *Hindustan Times*, New Delhi. 27 November 2004, p. 13.

⁵⁰P. Sainath. (2000). *Everybody Loves a Good Drought*. Penguin India.

⁵¹Under the Coriolis effect, a moving object seems to veer towards the right in the northern hemisphere and left in the southern hemisphere. An example of the Coriolis effect is cyclonic winds turning left in the northern hemisphere. It is the effect of earth’s rotation on weather patterns and ocean currents.

Table 14.6 Categorisation of cyclones

Category ^a	Wind force (mph)	Landfall damage	Storm surge (feet)
1	74–95	Low	4–5
2	96–110	Moderate	6–8
3	111–130	Extensive	9–12
4	131–155	Extreme	13–18
5	Above 155	Catastrophic	19 and above

^aAccording to Saffir-Simpson scale that measures potential property damage

counterclockwise in the northern hemisphere and clockwise in the southern hemisphere. It is formed when warm air over the ocean surface moves upward creating a low-pressure area below. The comparatively cool air from the neighbouring areas rushes to the low-pressure area thus created. This air becomes warm and rises and the process repeats. The warm moist air cools and forms clouds when it rises. The whole system of clouds and wind spins and grows, fed by the ocean's heat-evaporating water from the ocean surface. The ocean thus becomes a heat engine for nature. As the storm system rotates faster and faster, an eye forms in the centre. It will be very calm and clear in the eye, with very low air pressure. Higher-pressure air from above flows down into the eye. When the winds in the rotating storm reach 39 mph (63 kmph), the storm is called a "storm". And when the wind speeds reach 74 mph (119 kmph), the storm is officially called a "revolving storm" or a cyclone or in other regional names—"hurricane" in the Atlantic and Eastern Pacific, "typhoon" in the Western Pacific, "willy-willy" in Australia and "bagius" in the Philippines.

Each cyclone will be named for identity in communication with the public and others and further study and record. Naming assists in disaster governance and record. Each cyclone is officially named for identity by the concerned warning centre under the World Meteorological Organization (WMO) from the predetermined lists. The WMO generates and maintains the [list of names](#) for cyclones.

Cyclones are categorised according to wind force (Table 14.6).⁵²

Cyclones usually weaken when they hit land as they get disconnected and no longer receive the energy from the warm ocean. However, they often move far inland, causing heavy rains and wind damage before attenuating completely. Cyclone is a natural phenomenon but a threat to human habitats along the coastal areas. The damage is caused by the accompanying winds, rains leading to floods and storm surges that inundate the coastal areas. Most of the life cycle of a cyclone is in the ocean. The track of the cyclone can be predicted and plotted continuously either by subjective procedures: synoptic, satellite or radar methods or with deterministic tools of statistics and dynamic modelling. Usually the predictions are based on the combination of the two.

⁵²Natural disaster management. https://sites.google.com/site/disasterportal/storms_cyclones/cyclone-formation. Accessed 23 April 2020.

The rain is an advantage most of the time. But the fury surpasses the advantage with the destructive trails left behind by the cyclones. Managing cyclone disaster is by developing effective warning systems and cyclone proofing the trajectory where the likely damage is assessable.

Tropical cyclones generally form in any part of the ocean where the water temperature exceeds 80 °F (about 27 °C) and upper-level winds are weak. The ocean divisions where cyclones generally form are given below:

1. North Atlantic including Caribbean and Gulf of Mexico (hurricanes)
2. Eastern and central North Pacific (hurricanes)
3. Western North Pacific (typhoons)
4. Arabian Sea (Northern Indian Ocean) (tropical cyclones)
5. South Indian Ocean (tropical cyclones/willy-willy for Australia)
6. Coral Sea and South Pacific (tropical cyclone)

Bangladesh is one of the heavily cyclone-prone countries. In 1970, cyclone Bhola killed 500,000 people there and then East Pakistan. It was in Category 4. The next major hit was in 1991. The cyclone, named Gorky, killed approximately another 138,866 and displaced 10 million.⁵³ The largest and most intense cyclone ever recorded was Tip in 1979 in the Philippines. It lasted for 20 days and killed 99.

14.4.1.7 Tornadoes

Tornadoes, also called twisters (slang), occur because of instability created within the earth's air masses and wind systems. It is a rotating air column in the shape of a funnel in contact with the ground that moves at high-speed wreaking havoc on its passage. The width could vary from a few metres to a kilometre where it touches the ground. The tornadoes can generate extreme velocity wind systems. Wind speed up to 800 kmph (500 mph) has been recorded. It develops within a convective cloud always in contact with the ground. It can travel long distances causing heavy destruction on the ground. Tornadoes may occur in association with thunderstorms during the spring and summer in the mid-latitudes of both the northern and southern hemispheres. The most violent tornadoes come from supercells, large thunderstorms that have winds already in rotation. They form when warm, humid air collides with cold, dry air. The denser cold air is pushed over the warm air, usually producing thunderstorms. The warm air rises through the colder air, causing an updraft.

Most tornadoes, however, are comparatively weak events that occur in sparsely populated areas. They cause minor damage. Tornadoes are measured in Fujita Scale (F Scale) of intensity. The intensity varies from F0 (light damage) at wind speed

⁵³“Deadliest Natural Disasters since 1500”. *The Times of India*, Mumbai. 31 December 2004. p. 1.

64–116 kmph to F5 (incredible damage) 419 to 512 kmph. An equivalent Beaufort⁵⁴ scale for F0 is close to 8. The anatomy and science of tornadoes are still under study.

Tornadoes are classified into five types:

1. **Rope tornadoes** are the smallest in the shade of ropes.
2. **Cone tornadoes** are narrow at the bottom but expanded like a cone at the top.
3. **Wedge tornadoes** will look wider than they are tall and are quite destructive.
4. **Multi-vortex** and **satellite tornadoes** are basically rope tornadoes with extra areas of circulation.
5. **Water spouts and land spouts** look like water sprouts over land and water, respectively. The water spout is considered tornado only when it hits land.

For a vortex to be classified as a tornado, it must be in contact with both the ground and the cloud base. It is perfectly balanced between the bipolarity—ground below and cloud above. The imaginary and flexible axis passes through the rotating and moving air column. The cloud will be cumulonimbus (Cb) though at times cumulus (Cu).

Tornadoes grow out of thunderstorms, and they often occur alongside hail. The most threatening tornadoes develop from large, destructive thunderstorms called supercells.

Tornadoes were also glamourised in movies. People may like to appreciate them as shown in the fantasy musical *The Wizard of Oz* or as an adventure in *Twister*. The major tornado outbreaks are given in Table 14.7.

The deadliest tornado so far was the Daulatpur-Saturia tornado in Bangladesh on 26 April 1989. The number of people killed was approximately 1300 and injured were 12,000. The table and other records that are not copied from other sources also show present-day Bangladesh was battered by tornadoes more or less continuously.

14.4.1.8 Avalanche

An avalanche is caused when a large mass of rock debris, ice or snow loses frictional resistance and pulled down at great speed on a mountain slope by gravity and acquired momentum. It is also called snow slide. The avalanche holds tremendous energy to sweep and grind everything on its downward journey. The frictional resistance of the sloping surface is lost often after the foundation is loosened by spring rains or is rapidly melted by a foehn (warm, dry wind). Any vibration—by sound, earthquake, construction nearby, etc.—can start the mass in motion. Majority of all avalanches are released on slopes of 30–45° or less and above timberline⁵⁵ that face away from prevailing winds. This is because leeward slopes collect snow blowing from the windward sides of ridges.

⁵⁴The Beaufort wind force scale is an empirical measure that relates wind speed to observed conditions at sea or on land. Its full name is the Beaufort wind force scale.

⁵⁵Generally the upper limit of tree growth in mountainous regions or in high latitudes.

Table 14.7 Random list of tornado disasters

Year	Place (people killed in brackets)
23 September 1551 or 1556	Malta (600)

12–13 April 2020	138 outbreaks, United States (32)
23 November 1981	104 outbreaks, United Kingdom (nil)
26 April 1989	Bangladesh (1300)
21–23 November 1992	95 outbreaks, North America (26)

Avalanches are unpredictable and deadly. According to studies humans trigger 90% of avalanches.⁵⁶ But there are experts who say avalanches occur by a trifecta: terrain, snowpack and weather conditions.⁵⁷ That means avalanche occurs natural, but accidental human intervention becomes an accelerator.

Large rock avalanches have filled rivers and buried towns. They are commonly composed of bedrock fragments a few centimetres in diameter and include much soil and dust. Rock avalanches are thought to ride on a cushion of compressed air that allows them to travel long distances. A debris avalanche usually occurs in unconsolidated earth materials when weakened by moisture. Avalanche is dangerous for residents of mountain terrain and those who use mountains for adventure and recreation.

Disastrous avalanches occur when massive slabs of snow break loose from a mountainside. The mass of snow shatters like broken glass as it races downhill. They can travel as fast as cars on a freeway, up to 100 miles per hour.⁵⁸ An avalanche follows a trajectory according to gravity once it starts up in the mountain. It stops at the run-out zone in piles of snow and debris carried along the track. Though common

^bThis area in Gilgit-Baltistan, which is a disputed territory claimed by India

in winter, avalanches can be expected any time when the conditions are conducive. Humans can trigger avalanches by walking or riding over a slab or weak snow. The weak layer collapses underneath, and the overlaying mass of snow fracture and slide down as avalanche. Earthquake obviously can trigger avalanches in snowy and icy mountain terrains.

Avalanche can cause serious disaster. Human habitats on the valleys can be buried. Pre-emptive triggering of avalanches can help balance the snow packs. There are different types of avalanches. They include slab, loose snow (sluff), ice fall, cornice fall, powder, glide, slush and wet. Slab avalanche can cause larger disasters. Most common avalanches are the snow slides. Table 14.8 details some of the major avalanches.

The deadliest avalanche in history struck with an earthquake on 31 May 1970, at Ancash, Peru. It is also known as the Great Peruvian Earthquake. The earthquake triggered the avalanche that killed almost 20,000 people. The largest perhaps is the series of avalanches during what is known as the winter of terror in the Alps on the Austria-Switzerland border in 1950–1951. There were 649 avalanches in 3 months that killed 265 people and brought life to stand still causing heavy property damage.

14.4.1.9 Landslide

Landslide, also called land slip, is direct or collateral under multiple causes on the surface or underwater in the ocean. Underwater landslides can also cause tsunami. It is a collapse of land masses and associated debris including organic matters similar to an avalanche. Earth, rocks, debris, vegetation on the hills, mud, etc. move down

^a“List of landslides”. Wikipedia. https://en.wikipedia.org/wiki/List_of_landslides. Accessed 12 March 2019. And other open sources

forcefully in a mass wasting under gravity in a down-slope movement over the surface or underwater. The latter is called submarine landslide. Landslide covers five down-slope movements: falls, topples, slides, spreads and flows. The slide can be initiated in slopes already on the verge of movement by rainfall, snowmelt, changes in the water level, stream erosion, changes in ground water, earthquakes, volcanic activity, disturbance by human activities, ground fatigue and creep similar to an old building that may collapse without warning or any combination of these factors on ground.

Landslides happen on steep terrains especially when soaked by continuous rainfall, internal pressure, water movement and floods or when loosened or fissured by earthquakes. It occurs throughout the world, under all climatic conditions and terrains, costs billions in monetary losses and is responsible for thousands of deaths and injuries each year. Often, they cause long-term economic disruption, population displacement and negative effects on the natural environment.

Effective land-use policies in rural and urban management are required to prevent or pre-empt landslides. This is especially so in vulnerable areas. Unlike other disaster-causing incidents, landslides often are characterised as local problems, but their effects and costs frequently cross local jurisdictions.

Landslides underwater are not a cause of direct concern but for the tsunamis that could be highly devastating. The causes for submarine landslides can be collapse of an island, coastal or underwater earthquakes or volcanic eruptions or breaking of shore rocks and cliffs into the water. Some of the major landslides are given in Table 14.9.

The worst landslide so far came in series in an earthquake at Haiyuan, China, on 16 December 1920. The earthquake, second largest in terms of force in the twentieth century, generated 675 major landslides, killed over 100,000 people and caused extensive damage over an area of about 20,000 square kilometres.

14.4.1.10 Heat Wave

Heat wave is temperature stress on humans and other living things. They can trigger disasters in a chain reaction. Heat waves occur when summer temperature rises above normal.⁵⁹ Basically it happens when the rains play truant by atmospheric anomalies. The clear-cut nexus though not established, meteorologists blame global warming and climate change and ocean phenomenon of El Niño for erratic rains.⁶⁰ Severe heat wave kills people overstressing body's cooling mechanism. Sunstroke or heat stroke is common and lethal in a heat wave when exposed. There is certain reluctance on the part of governments to declare heat wave as natural calamity. It is time from the national security point of view to consider heat waves as an essential part of disaster security management. The extreme temperatures and resultant atmospheric conditions adversely affect people living in hot regions. They can cause serious health issues, forest and grassland fires, fall in water reservoirs including wells, drought, famine, killer lightning, habitat destruction and so on.

The meteorological departments decide on the heat wave depending on temperature limits at different places separated by plains and hills. It is based on the normal maximum temperature in a place. It is considered that heat waves are becoming more frequent because of climate change. The health impacts of heat waves typically involve dehydration, heat cramps, heat exhaustion and/or heat stroke. Heat waves place life in a limbo and seriously impacts national security efforts. Many experts believe that heat waves are linked with climate change. However there are counter viewpoints which don't attribute them to global warming. Whatever, the heat waves are here to stay. If it is so, the future is hot.

Heat wave causes conditions of hyperthermia which is dangerous to health and physiological functioning. Hyperthermia is the state related to conditions characterised by abnormally high body temperature. The condition occurs when the body's heat regulation system becomes overwhelmed by outside factors, causing a person's internal temperature to rise. Random details of heat wave disasters in the world are given in Table 14.10.

The deadliest heat wave reported was⁶¹ in Furnace Creek, Death Valley, California. The temperature reached 56.7 °C (134.06 °F) on 10 July 1913.

⁵⁹Parasuraman, S. and Unnikirishnan, P.V. (eds.). (2000). *India disasters report*. Oxford University Press. p. 177. According to the Indian Meteorological Department, severe heat wave is when the temperature increases 7 degrees Celsius or more above normal in a place at the given time of year.

14.4.1.11 Cold Wave

Cold wave is the temperature stress on humans and other life forms when the temperature hits below the bearable bottom. That too causes disaster situations. The great chill, an unusually large and rapid drop in temperature over a short period of time (say, 24 h or as decided by the weather people), is a serious matter of concern in terms of health and productive lifestyle. It is also a phenomenon of erratic climate according to scientists. Cold wave occurs when temperature drops suddenly, especially in winter. A cold wave condition is declared when the minimum temperature drops 4° below normal. A cold wave in a location also lowers the temperature in other parts of the country.

Besides the period, a cold wave definition may also be subject to specific conditions such as need and care for agriculture, industry, commerce and social activities. It is a kind of outbreak in which the temperature remains below certain degrees. It is 20 °F (−7 °C) in the United States.

Cold waves become disasters when they cause loss of life and property. The task for the government is to govern such incidents. When the body temperature in humans fall below 35 °C (35 °F), hypothermia occurs which can disorient a person and also impact on the health seriously by constraining body functions. Hypothermia

Table 14.11 Random list of cold wave disasters^a

Year	Place (temperature in bracket)
1683–1984	Europe
1694–1995	England (Great Frost)
1835, 1857, 1899 1936	United States (–33 °C minimum) United States
2004–2005	Southern Europe
2005–2006	Eastern Europe and Russia
2007	Northern Europe, Argentina (–32 °C)
2008	Alaska (–62.2 °C)
2009–2010	Great Britain and Ireland (–17.6 °C), Europe (–47 °C)
2010	Southern United States
2010–2011	New Zealand, Great Britain and Ireland (–1 °C)
2012	Europe (–35 °C)
2013	United Kingdom (–2.7 °C), North America, Middle East
2014–2015	North America
2016	East Asia
2017	Europe (–45.4 °C)
2017–2018	North America (–39 °C)
2018	Kazakhstan (–52.5 °C), Europe
2019	Vanavara, Siberia, Russia (–53.6 °C)
2020	Eastern North America, snowfall in Baghdad, Iraq

^a“Cold wave”. https://en.wikipedia.org/wiki/Cold_wave. Accessed 12 March 2019. And other open sources

is the opposite of hyperthermia re the conditions are on the other extreme. The mortality rate increases as in the heat wave conditions where it is because of hyperthermia.

Interestingly, more people die in a heat wave condition than in cold wave condition showing human capacity to bear cold more than heat. But the demand for energy rises during cold conditions. Hydel power systems become ineffectual during cold weather conditions as the water freezes. The freezing water also ruptures penstocks, pipelines, etc., and movements become difficult as roads will be blocked and vehicles may face technical problems to start and remain in motion. Firefighting becomes hazardous during cold spell as the water supplies may become challenging and awkward at the critical time. There are also chances of carbon monoxide poisoning as the fire hearths and kitchens. The world, especially the cold world, knows how to manage the cold weather and cold wave by early preparation. It is preventive as well as pre-emptive and is being carried out as a routine matter in most parts of the world at higher latitudes. The world has faced many cold waves in the past. A random listing of cold waves is given in Table 14.11.

The lowest air temperature measured on earth so far was minus 89 °C (–128 °F). It was recorded by Vostok Station in Russia in July 1983. Cold wave is deadlier than heat wave, as believed to be. The 1936 cold wave in the United States is considered to be the worst cold wave disaster in the recorded history.

14.4.1.12 Hailstorm

Hailstorms are very destructive to crops, properties and animals exposed to it. It is solid precipitation with balls or chunks of ice from 5 mm to 10 cm diameter raining under the influence of large convective clouds. Often cumulonimbus (C_b) clouds with strong updrafts provide the ideal situation for a hailstorm. Heavy shower and thunderstorms accompany it. They are common in the middle latitudes late afternoon and usually last around 15 min. Hails are formed at high altitudes within massive cloud concentrations when supercooled water droplets adhere to each other and form solid layers of ice. The average velocity of hails when they fall may exceed 170 kmph. The terminal velocity of hail depends on the size: 1 cm size falls at 9 m per second (mps) which is around 32.4 kmph, whereas an 8 cm one will achieve a velocity of 48 mps reaching 172.8 kmph.

The size of a hailstorm can vary. The largest found so far has been 8 inches in diameter (2010, United States). The weight was about a kilogram. Like tornadoes hailstorms are also figured in movies and public domain of entertainment.

The worst case of hailstorm in recorded history was also in Bangladesh. Grape fruit-sized hails fell over Gopalganj and killed 92 people in Bangladesh on 14 April 1986. Large hails can cause fatal head injuries though it is rare. Hailstorm can cause serious damage to properties and crops. Hail is one of the most significant thunderstorm hazards to aircraft.

14.4.1.13 Glacier Burst

A glacier is a large cold world of crystalline ice over land. It will also comprise snow, rock, sediment and also liquid water entrapments. A glacier burst can flood and damage the area in lower gradients along with collateral damages. Glacier burst could also be due to other reasons, not nature induced alone. More than 90% of glaciers are in Antarctica. The problem with the glacier is that it moves. Every continent except Australia has glaciers. Glaciers can induce disasters.

In one such incident, a glacier burst caused havoc in the Indian state of Uttarakhand on 7 February 2021. It is similar to a dam burst. The glacier burst releases the water trapped by it inside. For this matter the term glacier burst is a phrase used to explain a glacial lake outburst flood (GLOF) when there is a sudden release of a significant amount of water retained in a glacial lake irrespective of the cause. It is a type of outburst flood. It happens when the glacier containing the body of water melts or breaks and overflows the glacier. Various cascading forces are included in inducing a glacier burst. There can also be direct causes. There were many GLOF geoscientists presumed to have happened in this world. There would have been casualties too. But not up to the level of other disasters. The GLOF often ends up as an incident of nature to balance. The casualties in the glacier burst in Uttarakhand, India, on 7 February 2021 has been about 70 plus. Two hundred fifty were reported missing.

14.4.1.14 Threat from Extraterrestrial Objects

Serious threat from extraterrestrial objects, as known today, exists in low probability with those bodies in the solar system that may eccentrically cross over and intersect the orbit of the earth on a collision course. These are known as asteroids and, in smaller parts, meteoroids. They become known as meteors when they enter the earth's atmosphere. They burn off totally or partially in the earth's atmosphere by velocity-induced frictional heat. Those that fall on the surface partially burnt are called meteorites. Asteroids are quite large. They could be several kilometres in diameter and can pass through the atmosphere without getting burnt off, strike the earth's surface at velocities of many kilometres per second and produce a crater at the point of impact. They are often called meteorite craters, in spite of the fact that the impacting meteoroids themselves are almost entirely vapourised during the explosion. High-velocity impact by objects of this kind on the Moon, Mercury and Mars is in large part responsible for the cratered appearance of the surface of these bodies. The spacefaring nations need to be collectively prepared for containing asteroids that may home on to earth by deflection or destruction.⁶²

It is presumed that 65 million years back an asteroid called the KT meteor destroyed the dinosaurs.⁶³ According to scientists a similar asteroid can come dangerously close to earth by 6 June 2027.⁶⁴ Meteoroids are large space bullets. A hit can be dangerous. An asteroid was first observed in 1989 in a close-up. It was more than a mile across. Asteroids are mountains tumbling across space. A date with an asteroid one day can be the greatest oversight in human history. A good number of earth-crossing asteroids are not discovered or tracked.⁶⁵

There are a couple of hundred million asteroids and meteoroids in the solar system. Those in the earth's circle are called neos—near-earth objects. Statistical chances of flyby are more than once a year. Actual impact probability is once every several years. But the impact when it happens can cause more damage than any other known disasters according to scientists.⁶⁶ Neos alone need not be the cause for worry. There could be other threats too from beyond space. Extraterrestrial disaster could come from a falling star in the solar system. Scientists all over the world were amazed when the super-magnetic neutron star, called SGR 1806-20, about 50,000

⁶² Many asteroids and meteors pass earth without the knowledge of people except those who keep a close alert watch on them. For example, an asteroid, twice the size of Taj Mahal, passed earth on 14 November 2020. The asteroid named 2020 ST1. It was announced by NASA's Centre for Near-Earth Object Studies (CNEOS). Its size was 175 m and speed was 28,646 km/h. Anmol Sharma. Asteroid, twice the size of Taj Mahal, will pass earth today. <https://inshorts.com/en/news/asteroid-twice-the-size-of-taj-mahal-to-pass-earth-today-1605363401728>. Accessed 16 November 2020.

⁶⁶ "Asteroid Gives Earth Its Closest Shave". *The Times of India*, Mumbai. 28 August 2004, p. 11.

light years⁶⁷ away in earth's galaxy, sent a flash of radiation that was bounced off the moon over the earth that lit up the sky in February 2005. The light detected was brighter in gamma than visible light or x-rays. The shower of radioactive rays could have caused mass extinction of all living things on earth if the distance of origin was ten light years away. The energy released was about 10,000 trillion watts.⁶⁸

Earth will have no other choice but to engage it when the rock from deep space home on it. Besides planning the engagement techniques and updating periodically, it is also important to decide on the area of engagement for various types of meteor encounter. This aspect may be taken into consideration while deciding on the extent of contiguous space as well as deep space in law of the space. An important factor here is to safeguard the earth not only from the meteor but also radiation and debris, if any, that may fall on earth after engagement. The debris may also carry hostile alien biochemical elements in them.

14.4.2 *Human-Induced Disasters*

The author has certain reservations in using this terminology—human-induced disasters (HID)—in a macro disaster appreciation. Humans could be one of the trifecta causes, but not the ultimate cause for an incident that could become a disaster in most of the situations. This is based on the assumption that humans are intellectually oriented for survival. Using intellect otherwise is suicidal. If so can suicidal tendencies by default for system survival? The term is anyway here. The human element subscribes to the disorder and makes the disaster speed up in its passivity. Important examples of such “human-induced” disasters quoted here are climate change, riots, ethnic conflicts, refugee issues, etc. There are also others such as war, pandemics, famine and so on. Human-induced disaster can be anthropogenic, primarily managing environment, or intentional to damage another human system (Box 14.2). Intentional targeting human and associated systems can only be done by human adversaries. Intentional destruction can exist during military operations, covert activities and terrorist militancy attacks. The two-decade-long Vietnam War (1955–1975) also known as the Second Indochina War witnessed large-scale destruction of natural environment, ecosystems and biomes besides human anthropogenic attacks on environment in violation to the ethical aspects of war.

Mammoth dams are said to be the cause for many earthquakes and flash floods. Activities in the snow-clad mountains are blamed for avalanche, deforestation for heat waves and drought, pollution for disasters caused by climate change and urbanisation and development projects for landslides and more. There are many

⁶⁷A light year is the distance light travels in a vacuum in year. It is approximately 9.46 trillion kilometres.

⁶⁸“Giant Flare Light Up Milky Way”. *The Times of India*, New Delhi. 20 February 2005, p. 1.

incidents of human-induced small and large disasters. Active disasters of such nature and scale may not happen in the future as the world is becoming more responsible.

14.4.2.1 Military Conflicts

Military conflicts are disasters in a form packaged as war by humans against humans. This is an interesting find that can lead to many conclusions. One of them is the hypothesis that wars are natural because humans have to kill themselves by default to survive. The author cautiously believes in it. But at the same time this book carries a contradictory quote from the author that “war is over”.

Wars are seen by governments too as a disaster and brought under disaster management methods along a parallel track with the country’s foreign departments working overtime parallel to the military to contain. In war the time available to protect people from death and destruction lies in the few minutes before opening it. That is the critical time for making a decision to engage or not. The author was privy to such a decision in 1971 when a planned attack was called off by his fleet commander on the grounds that many non-combatants would have been killed and habitats destroyed. That was not necessary for the desired outcome though would have perplexed the adversary.

Military conflicts show humans are still humans. They can’t avoid conflicts. Perhaps the higher-level sapiens that humans are wishfully regarded now (according to the author) may avoid it. Even then they may have to submit to other conflicts since the urge to kill to survive is uncontrollable. But conflicts are preferable to wars along the process of evolution, especially when there is no other choice. Peace as mentioned earlier is an abstraction and will remain so. Humans or even the present-day sapiens cannot count on a warless or zero-conflict situation.

14.4.2.2 Riots

Riots are not accidental. Riots are caused by groups; individuals work behind it. It is war within the system, whereas declared wars or other aggressions are external to the system. Riots will have all the characteristics of a disaster—injury, death and loss of property and environment. Group psychologists believe riots develop from incidences of injustice in the social system. That is just a superficial argument according to the author. Human mind lies in the deep.

Riots will have a reason that angers a particular human system or controlling individuals in high power. Often it can happen because of the failure of governance. Or governance machinery itself can initiate a riot under political motivation. Subversive agents can create riot with the help of their cultivated assets in a country. But a government should be able to handle riots if they are prepared and willing. The government needs to understand riots with respect to its nature and character. When the riot is communal, it is preferable to see it separately under ethnic conflict. Ethnic

security is a separate identified element of national security explained in detail in the book.

A riot involves violence. The concept embraces a wide range of group conduct. Riot is a harmful collective behaviour under intent. Riots are to be dealt by the law of the land as a criminal offence. Basically the psychology of riot is when a restless person is part of a group that is restless at a higher level. It is mob action. Mob psychology leans towards change which could be good or bad, more often the latter. Good means constructive engagement; bad means destruction. It is visible when people break into shops on the streets and carry home goods. The people who engage in such riots are without any leader or nefarious programmer. Some of the people in the riot mob could be the normal law-abiding citizens. This brings to light that riot behaviour could be inherent. It is not known whether it is in all or some of the people. But a trained riot force can contain disaster occurrence through riots and turn it into an incident of law and order. Maintaining law and order and mob control applying psychological measures can contain riots in almost any situation.

14.4.2.3 Ethnic Conflicts

It is important to understand, in the context of this study, ethnicity means any difference between humans that may or may not lead to conflict. Conflicts in the ethnic domain of any kind can be deadly whether it is a religious activism of death and mayhem or a heinous crime of honour killing. It becomes a disaster when one ethnic group attacks another. Most of the time, the attacks are premeditated, and where the only emotion in the forefront is hate, sometimes misplaced⁶⁹. It is a deep-rooted psychological behaviour in a group driven by predatory primitive instincts. The attacks are intense, sudden and lethal. They leave behind death and chaos. Ethnic conflict management needs serious study. Often it becomes difficult to manage when the authorities in power incite such riots based on ethnicity for political or ethnic reasons. It is common in both forms of governance: democratic and anarchic.⁷⁰ The targets are specialised; the timings are well calculated; the participants are identified and trained; and the execution follows certain identifiable events. Most of the time, ethnic riots take place when there is political uncertainty. Once the riots break out, the mob behaviour changes into the “act before you think” pattern that leads to serious destruction.

⁶⁹The term is misplaced hate. Taken from the lyric of 2pac: “. . .misplaced hate makes disgrace to races we are under, I wonder what it takes to makes this. . .”. Misplaced hate in this study is hate in the guise of other feelings such as love, honour, fear. . .and may not men exactly what 2pac want to subscribe.

⁷⁰According to this study as mentioned earlier, there only two forms of governance: (1) democracy in which people govern through an agent called government in various types and (2) anarchy in which people dealing with themselves directly without an agent which I unitary as form and type.

14.4.2.4 Refugee Situations

Refugees are victims of dislocation and disposition, or human trafficking, one in the trifecta of Crimes³. Mostly they are citizens of failing and failed human systems. They flee from their homes situated in conflict-ridden regions for the fear of death in demographic chaos. They face harsher situations in this process. These are a kind of “nowhere people” when they are treated as refugees. They certainly will add to the demographic density of the nations receiving them and create ethnic bifurcation when the disaster scenario will shift from refugee influx to ethnic conflicts. Statistics on refugees go into millions all over the world. It is a direct measure of unrest in national security principles and its governance.

Refugees can be internal or external. There are internally displaced people, because of unrest or ethnic conflict in certain area, who need protection and continued support for their existence as citizens of their country such as Kashmiri Hindus in India evicted from their homes in Kashmir forcefully by militant activism supported by failed governance⁷¹ in demographic security. The outcome can be quite serious but different from external refugees who will need care till the time is appropriate for repatriation. The Tamil-Sri Lankan refugees who flee to India at critical times when insurgency peaked in their country is an example. The problem becomes more serious when external refugees are not enumerated and their presence in the country cannot be identified. Refugee situation though a disaster security subject can directly intervene with a nation’s ethnic security and demographic security, among others. These are explained more in the concerned chapters.

14.4.2.5 Policy-Activated Disasters

This is a subject that has not been seen by disaster specialists normally. Can a policy of the management or governance cause a disaster? An example could be the Bhopal gas tragedy in India. It raises doubts whether policy decisions were the root cause. The reference for investigation was that of an industrial disaster. It is more serious when it is an outcome of policy decisions. The liability is unlimited in such cases and may even demand death penalties to those who are responsible. In certain quarters the tragedy was quoted as human-induced industrial disaster. According to author Dominique Lapierre, there was also talk of sabotage.⁷² Sabotage could be a policy decision. The accused were the former Union Carbide Corporation Chairman Warren Anderson and eight others. The charges were diluted in September 1996.

⁷¹ Failed governance doesn’t mean incompetent governance all the time. Sometimes it can be a strategic failure where, for example, government carries out deliberate ethnic cleansing even if it is against responsible governance ideas.

⁷² Lapierre, D. Do not Forget the Martyrs of Bhopal, *The Times of India* (Mumbai), 3 March 2000, p. 1.

But imagination can run wild under investigative inquiries to any incident. The tragedy in Bhopal occurred 10 years since India carried out the first underground nuclear test on 18 May 1974 and startled the world, especially its impressionist Cold War foe, the United States. The explosion made India the world's sixth nuclear power. It would not have been such a big shock to Pakistan as it was for the United States on geostrategic terms. Pakistan was in no way to be left behind. The then prime minister, Zulfikar Ali Bhutto, launched the Pakistani nuclear programme, said to be in 1979, under a renowned metallurgist Abdul Qadeer Khan (Bhutto probably commenced the programme in 1972, 2 years earlier to India's test, subsequent to his meeting with the Indian prime minister in Shimla the same year to discuss the way ahead after the defeat in the 1971 war). Pakistan concentrated on developing the capacity of producing weapon-grade nuclear material and delivery systems by any means. Pakistan's main nuclear research facility was in Kahuta on the rugged foothills of the Himalayas in the North Western Frontier Agency. The CIA reportedly alerted Pakistan that India would attack Kahuta on 21 October 1984.⁷³ Pakistani warning was that their fighter-bombers would strike at every nuclear installation in India.⁷⁴ In a (presumed) critical nuclear flashpoint, was it necessary to make India aware of the consequences of its intentions by a biomodel in the form of an industrial disaster? Godfathers of the underworld are known to believe in such live simulations to drive home serious points to those who dare to defy the dictates. If so, who was interested in teaching India a lesson? Did Bhopal replace the beheaded Khartoum of "Godfather" fame?⁷⁵ Paranoia can lead to anything in the hands of those who are capable but unwise and ruthlessly selective in their decisions. Pakistan did not have the geostrategic capability to teach India a lesson to pre-empt an attack if India was really planning it. That is a big question. Well, the Bhopal industrial disaster just a month plus later could be strictly coincidental, but the ways of the world are very deceptive when power games play havoc in the lives of common people. The one who will never know is the one who is considered the know-all—the common person that constitutes the public. That is the irony of it all. More than a disaster, Bhopal was a tragedy.

⁷³ Burrows, W.E. and Windrem, R.. (1994). *Critical Mass*. Simon and Shuster. p. 350.

⁷⁴ It was quite natural for the American intelligence agencies to conclude in such a manner as seen in the past, whereas India's operational strategies till then did not project that India would launch such a strike.

⁷⁵ Mario Puzo, *The Godfather* (London: Arrow Books, 1998). Jack Woltz, the authoritarian, lascivious and influential Hollywood movie magnet, who hid his paunch in a perfectly tailored suit, got the message, when he refused to cast Johnny Fontane, the godson of Don Corleone, in his movie in spite of requests sans warning from the Don's emissary, Tom Hagen. The warning came in the form of the severed head of his 600,000 dollar undefeated racer *Khartoum* whom he had decided to put to stud in his stables. He found it right on his bed in a thick cake of blood when woke up alone on a Thursday morning. He knew what could follow unless he changed his intentions.

There was news that American scientists are preparing a relook at the accident by recreating the scenario by simulation under controlled conditions in Nevada.⁷⁶ There seems to be some unresolved questions. It seems to be that the chemical reactions that took place during the accident were not clear. According to the news, a key question for which the American scientists want to find answer is whether deadly chemicals like hydrogen cyanide and carbon monoxide were also released along with methyl isocyanate (MIC) on that fateful night. On the other side, the Indian scientists feel, according to reports, that such an experiment may not be necessary to understand the reactions since the reports are absolutely clear on the subject. The Indian Council of Medical Research (ICMR) in its report stated the presence of 21 chemical compounds including 10 unidentified ones that were found in the residue of the Union Carbide tank from which toxic fumes leaked. The deadly hydrogen cyanide was very much there.⁷⁷ Is there more to learn?

Box 14.2: Typical Anthropogenic Disasters

1. *Industrial accidents.* Industrial accidents intentional or unintentional can put humanity in extreme agony and trauma for years especially if related to chemical or hazardous industries.
2. *Offshore oil well blowout.* An accident in an offshore oil well can cause oil spill that can destroy the entire flora and fauna of the ocean and coastlines including the internal waters for many years.
3. *Nuclear meltdown.* Explosion in nuclear reactors or blowup because of external reasons that were not prevented in time could be disastrous for the population around even beyond generations.
4. *Global warming.* It is said and proven to a great extent that the present concerns of global warming are primarily human induced. There is also argument that it could be cyclical. But there are enough evidences around the world where careless governments and people are damaging the environment by careless and profit-motivated emission of carbon dioxide and other greenhouse gases (GHG) that will seriously warm up the global environment. The result will be climate change and associated problems such as sea level rise and inundation of low-lying areas, melting of ice and flash floods, imbalance in the ecosystem and biomes, ocean acidification and many others including collaterals that humans are not able to appreciate presently.
5. *Wild fires.* Intentional or accidental wild fires have been a curse in many countries which destroy the forests and grasslands.

⁷⁶Sharma, D.C. "U.S. Sees Defence Lesson in Bhopal Tragedy". *Hindustan Times*. New Delhi. 29 November 2004. p. 1.

⁷⁷Ibid.

Box 14.2 (continued)

6. *Environmental pollution.* Environmental pollution is a health hazard as well as part of environmental security. These include contamination of water tables, rivers and lakes, oceans, etc.
7. *Others.* There are many other disasters that can occur because of human negligence including transportation disasters, mining accidents, landslides flash floods, etc. because of developmental activities, urbanisation and so on.

14.4.3 Chance-Induced Disasters

In this chapter, disasters have been classified under three types based on identification for reasons of wider acceptance of the concept as an element of national security. Strictly, such differentiation is not all pervading with respect to managing the concept since the governmental systems can only attempt to prevent disasters in a limited manner.

Notwithstanding limitations, it is advisable that all disasters irrespective of their classification are seen under one title—simply as incidents that cause grave human trauma. That will be a single-pronged approach to disaster avoidance (preventive or pre-emptive) management, which is the basic principle of disaster security optimisation. The examples given in this section are those disasters that have not been mentioned previously and thereby categorised as chance-induced disasters.

Chance-induced disasters (CID) are other disasters or hybrid disasters that are not primarily influenced by NID or HID, though visible in traces.

14.4.3.1 Epidemics and Pandemics

An epidemic is a widespread occurrence of an infectious disease in a community at a particular time. It becomes a pandemic when spread over a wider area such as the whole country or the world. Epidemics and pandemics can not only destroy populations but also change the lifestyles of survivors.

The World Health Organization (WHO) of the United Nations is the agent for global health security that advises governments on health governance. It had published an ambitious document “Managing epidemics” explaining key diseases of the world in 2018, the 100th year of the Spanish flu (actually originated in China, not Spain, that the Spanish calls French flue as they got it from the French). Covid-19 made its way a year later. The WHO in its statement confirmed that the Wuhan Municipal Health Commission, China, reported a cluster of cases of pneumonia in

Wuhan, Hubei Province, and a novel corona virus was eventually identified.⁷⁸ The date shown was 31 December 2019. On 1 January 2020, the next day, the WHO set up the Incident Management Support Team (IMST) across the three levels of the organisation headquarters, regional headquarters and country level for managing the pandemic on emergency footing.

It was reported that the first case of the novel corona virus was detected in Wuhan city in late December 2019 according to Chinese authorities. There was international criticism on cover-up by the Chinese. The complaint was that the Chinese Communist Party suppressed the reports on corona virus and punished the doctors, preventing Chinese and international experts to miss critical opportunities to prevent a global pandemic. It was mentioned that Li Wenliang, the “whistle-blower” doctor in Wuhan, was reprimanded by police when he warned about the virus in social media on December 30. He later died due to the infection.⁷⁹ The earliest known person with symptoms was later discovered to have fallen ill on 1 December 2019.⁸⁰ The final chapter in the concluding part (Part VI) is on Covid appraisal which is very much a national security topic beyond disaster management alone.

Managing epidemics and pandemics is the government’s responsibility and preventing them from becoming disasters. It has parts of nature and chance, but humans play a major part. The world has gone through many epidemics and pandemics; millions were dead. This is highlighted more on the section on health security. Table 14.12 lists some of the major epidemics and pandemics the world had witnessed so far.

14.4.3.2 Industrial Disasters

Industrial accidents hazard industrial workers as well as those in the neighbourhood. Fast-track industrialisation can violate most of the selective norms for industrial safety. Industrial policies that overlook safety based on adhocism can cause serious damage not only to life and property but also to a nation’s capability projections.

India faced the worst industrial disaster when the Union Carbide Plant in Bhopal⁸¹ blew up spewing toxic chemicals in the vicinity on 2–3 December 1984. Twenty years later, it has been reported that the victims who are alive still suffer

⁸¹After 20 years, orders have come to compensate the victims of the 2–3 December 1984 Bhopal gas tragedy from the Supreme Court of India. Fifteen thousand lives were killed and 500,000 injured in the disaster. The money awarded stands Rs 1503 crore. The Supreme Court directive was

Table 14.12 Major epidemic and pandemic disasters^a

Year	Place
1. 3000 BCE	Prehistoric villages in northeastern China now archaeological sites Hamni Manga and Miaozigou. Destroyed entire population
2. 430B CE	Plague in Athens. Lasted 5 years
3. 165–190	Roe, Antonine plague or smallpox. Carried by Roman soldiers returning from Parthian campaign. Around 5 million died in the Roman Empire. Rome rode into instability and Christianity became popular
4. 250–271	Thebes in Egypt, Cyprus. Plague. Estimated to have killed 5000 people a day in Rome alone. Excavations of mass burial sites in places like Luxor with body remains covered by lime considered disinfectant. Lime producing kilns were found in the city
5. 541–549	Byzantine Empire. Bubonic plague occurred repeatedly collapsing the Byzantine Empire. About 10% of the then world population died
6. 1346–1353	Black Death was a bubonic plague spread from Asia to Europe. About half the population of Europe died. Spread by the strain of bacterium <i>Yersinia pestis</i> spread by flies on infected rodents. Expected non-existent today
7. 1519–1520	Smallpox in Mexico killed about 5–8 million people
7. 1545–1548	Cocoliztli (pest) epidemic in the Aztec, Central Mexico. Killed 15 million people in Mexico and Central America. Researchers later found that epidemic was caused by a subspecies of <i>Salmonella</i> known as <i>S. paratyphi</i> C. still in existence today
8. 1665–1661	London plague, during the time of King Charles II who led a mass exodus. Fifteen percent of population of London died
9. 1855–1960	The bubonic plague that began in China killed about 15 million in India and China. Ten million died in India alone. It was the deadliest and longest pandemic disaster that affected India. Also affected other parts of the world
9. 1918–1920	Spanish flue, A/H1N1 influenza infected 500 million people and killed about 17–100 million worldwide
10. 1981–	HIV/AIDS is still continuing worldwide. The death toll as on 2018 is about 35 million
11. 2019–	Covid-19. The pandemic originated from China continues in 2021 also and perhaps may last quite long in the future under mutated variants. The estimated death toll is above 8.3 million worldwide as of June 2021

^aJarus, O. “20 of the worst epidemics and pandemics in history”. 20 March 2020. <https://www.livescience.com/worst-epidemics-and-pandemics-in-history.html>. Accessed 12 October 2020

from sleep disorders, pain, cancer, deformity of new born, chest pains, asthmatic attacks and failing health due to inhalation of toxic gases. Tears slide down their cheeks when they narrate their *trauma*.⁸² Only the government can stop human-induced disaster; others can support the efforts of the government. That makes

to disburse the money on a pro-rata basis among the victims. Here the government is the claimant, not the individual. The Supreme Court had banned individuals putting the claim.

⁸²Parameswaran, P. “20 Years Later, the Pain of Bhopal Gas Lingers”. *The Asian Age*, New Delhi. 11 November 2004, p. 5. According to this news about 1750 died instantly and 2500 within a week. There is an estimate of another 10,000 dying later. That makes the toll 14,250. Union Carbide paid 470 million US dollars to the Government of India in a settlement reached in 1989. According to

disaster security, especially preventing human-induced disasters, a national responsibility with the support of people in its administration and governance. The Bhopal gas tragedy, as the accident came to be known later, though an identified industrial disaster could also be classified as a policy-induced one. It is explained separately.

14.4.3.3 Fire

Fire, the most potent companion of the humans that changed their life in the early days, has a very fiendish face when it becomes a destroyer of everything that comes on its path. It has insatiable appetite for fuel in the presence of oxygen. It runs berserk when not controlled. All kinds of uncontrolled fires can lead to calamity. Some of them that happen when the administration relaxes enforcement of regulations can become vital and traumatic in a country. Fire is associated with most of the destructive acts, violence and accidents. There are also accidental fires in coal beds, oilfields, forests and grasslands that burn for days together.

Among them a fire in the coal bed is the worst. It is a ticket to disaster. A fire of that kind will spew carbon monoxide into the atmosphere to a level of 2000 part per million (ppm) and more, whereas a level of 150 ppm⁸³ is a killer. Several thousands of fires in the coal bed occur in various parts of the world every year. The area they cover is vast, but the world knows little about them. As per estimates from satellite imagery, in China alone, as much as 200 million tonnes of coal is burning into smoke every year.⁸⁴ This is an unaccounted version of the emission of carbon dioxide—the notorious agent of global warming—that is uncontrollable because the agencies are not aware of it. Coal fire occurs when lightning or forest fires ignite an outcrop of coal by accident or by careless mining practices. Ineffective mining regulations and chaotic mining practices are the causes. In certain parts of the world, there are effective mechanisms to prevent and handle coal fires. Coal gas and shoot can cause acid rain that can spread across national boundaries. The underground fires add to the environmental problem immeasurably. Extinguishing fires become a problem if they are deeper. The coal fire has been seen at a depth of 290 metres at some places.⁸⁵ The coal fires in China and India are serious to the environment besides burnout of a valuable energy resource. While in China, it is in Desert Mountains; in India they are in densely populated areas. Millions of miners and their families live and work in blinding smoke that emanate from coal mines under fire. The situation is worse in Indonesia. Most of the mines that are hit are under tropical rain forests. The fires are consequential to illegal clearing of forests for wood by loggers. Fires in the coal bed are underground that doesn't get smothered under

this report, the Supreme Court award to the victims is 15.67 billion rupees (1567 crores) for 572,173 victims. It means 800–1000 dollars for 20 years of extreme suffering.

⁸³Part per million.

⁸⁴Dyson, J. "Fire Down Below." *The Readers Digest*. June 2004. p. 52.

⁸⁵Ibid. p. 54.

rain. In Indonesia, the coal bed fire also ignites forest fires that compound the problem. The devastation is unimaginable. Indonesian forest fires burnt 290 days in 1997–1998.⁸⁶ Smoke darkened skies as far away as Afghanistan. Ships collided, aircraft crashed and millions of people choked on smog.

14.4.3.4 Accidents

Accidents can be far too many, and those that could be brought under disaster security come from all those that cause serious trauma to people; however small their numbers may be. Accidents are also costly for the economic development of a nation. The logistics of safety has to be seen from the productivity factor—competence and efficiency assuring safety to people and collateral to economic development.

14.4.3.5 Resource-Activated Disaster

Resource-activated disasters (RAD) come from over- and unplanned exploitation of natural resources. An example is the resource-induced disaster in China in August 2004, when the water table depletion caused the earth to sink about an area of 1.6 sq kms that caused replacement of about 8600 people. The loss estimated was about US \$18 million.⁸⁷ Similarly those that are caused by coal bed fires, illegal logging, mining, etc. can be brought under resource-induced disasters for a different appreciation. Often in strategic analysis, the analyst should approach the problem from different perspectives. Changing classifications will support such approach.

14.5 Disaster Statistics

Disaster typology can overlap. There can be similar disasters, but the cause for the incident can be different. For example, an industrial disaster can be chance induced or human induced. It is not in the typology but the Incdis that matters besides the legal aspects in governance. Human systems are highly disaster prone. Humanitarianism is often talked about as the key in mitigating disaster. But there is a lot more to do in national governance related to national security for a fillip in the area of disaster security in nations and regions that are accident prone. Disasters will have cross-border effects. Disasters do not respect borders. Studying disaster statistics can lead the way to better disaster management especially in prioritising contingency

⁸⁶Ibid. p. 55.

plans. Table 14.13 shows some of the major disasters of the world in the decade 1990–2000.

According to statistics, every country in the world is exposed to disasters in varying degrees. Every nation has its own record of disaster casualties. India is one such country where disasters strike at will. According to reports, in the decade 1988–1997, disasters in India affected over 24 million people and killed 5116 each year. In 1998 disasters affected 34,112,566 people in India and killed 9846. Between 1985 and 1995, disasters caused an economic loss of about US\$1883.93 million.⁸⁸ These statistics speak volumes about the importance of disaster security to the national security of India. Major disasters in South Asia during the same year were floods, wind-related disasters, epidemics, earthquakes, tsunamis and droughts.⁸⁹ There are comments in certain quarters that there is a tendency to exaggerate casualties with the purpose of raising funds and money flow post disaster rather than engaging in relief operations.⁹⁰ This, if true, is a disaster by itself. According to a study by the World Bank, disasters can cause serious economic problems for India. Fifty-five percent of India's land area is earthquake prone.⁹¹ The magnitude of disaster security applicable to India's national security can be seen from such statements.

The major setback in case of a disaster is the degradation of sustained economic and health progresses made in a country. According to experts, disaster security can be ensured only by a proper “preparedness, response and mitigation policy” with legislative and administrative framework to implement it.⁹² It needs a multi-pronged approach embedded in a practical code of conduct. The editors of India Disaster Report 2000 suggest a four-tier approach in the Indian context: national, state, district and block levels.⁹³ But these measures only provide mitigation.

⁸⁸Parasuraman, S. and Unnikirishnan, P.V. (eds.). (2000). *India disasters report*. Oxford University Press, p. 6.

⁹²Parasuraman, S. and Unnikirishnan, P.V. (eds.). (2000). *India disasters report*. Oxford University Press. p. 375.

⁹³Ibid. p. 377.

There are two issues that are often associated with disasters: economics and war. They are not considered separate disasters under disaster security since they are identified as elements of national security and discussed separately. Both are ongoing at one time or another in some part of the world. The central Asian region, Caucasus, former Yugoslavia and Bosnia had faced serious economic crisis in the late 1990s. War is an ongoing issue continuing in many parts of the world. The twenty-first century's first genocide was in Sudan, which was both economic and war-induced disasters. The statistics on disasters in the world was always a shade pale compared to the lingering human trauma that would be ongoing at any particular time somewhere in the world. Management of disaster security, therefore, has to be future perspective.

14.6 Disaster Cycle

Disaster cycle comprises the collective behaviour of national and international governments, disaster workers and experts, media, community or group in a probable disaster area from the early warning to rehabilitation. Activities peak immediately following a disaster. Thereafter it will be subdued, especially when the initial shock fades away from the memory of the people except direct or indirect victims. A disaster cycle goes through different stages starting with a warning period. This period, according to disaster management experts, is the most difficult because people are reluctant to take it seriously. This is also applicable to governments and officials. There were reports and general feeling among scientists and disaster experts that neither the common people nor those in power take a disaster warning seriously and involve in efforts to prevent them.⁹⁴ There will be a collective self-deception and the inhibition of tendencies towards flight from imminent disaster. The next stage is the impact and stocktaking period. The period of impact can be long in certain cases like floods, hurricane, etc., whereas, in an earthquake or explosion, the period of impact is short. According to disaster psychologists, the combined period of impact and stocktaking is marked initially by a fragmentation of human relations, as people are separated from others and customary moorings. Subsequently, there is a resurgence of interpersonal warmth that transcends customary social barriers within the disaster-affected community. The final stage is rebuilding and damage mitigation. This has to be done under a contingency plan appropriate to each disaster.

In a disaster cycle, the victims go through behaviour modifications. Post-disaster situation can be characterised by apathy, disorientation, wandering, surprise, perplexity, fear, anxiety and helplessness. Life absolves the living. The psychological and emotional aspects are more important. While there will be a flood of

⁹⁴Guardian News Service. "Tidal Wave Disaster Alarm Sounded". *Hindustan Times*, New Delhi. 11 August 2004, p. 19.

contributions in various forms for relief operations, emotional aspects are not catered for. Disorganised relief operations will culminate in a different disaster. Too many agencies, competition to gain limelight, opportunism, corruption, etc. may push relief operations under cloud with the victims hardly getting any benefit. The victims need protection and serious support from social psychologists and trauma managers. They should be made part of any disaster contingency plans where traumatic situation can develop. Disaster security is one element that can place even the most developed nations in a limbo. In fact the more developed a nation, the more will be the disbelief among people. “How can it happen to us?” will be the question. The time from denial and disbelief to acceptance will be longer and so the healing process. Disaster creates an aftermath of moral ambiguity. Initial horror gives way to an insidious sense of guilt. The aggrieved will feel the loss and also the gain of one’s own life. The guilt of the survivors will still remain with them. It was death by proxy for many. The victims in disaster may lose faith in “their” own God and will be ripe for conversion. It is a situation that the agents of religions will take advantage. The victims will be vulnerable to theft, robbery and exploitation. Lawlessness will be a serious issue. Sensitive areas will be open for espionage under the guise of relief operations, and the country may also end up as a financial aid victim under silent economic warfare. Rumours and panic information will spread fast in the aftermath of a disaster. Media reports, if not briefed thoroughly, could distort situation. The disaster cycle will be a test for a country’s capability in handling the disaster security element of national security. Disaster security is in peril in an ineffective system when all the people can hear is the lament of the dead in the midst of people clamouring for power, fame and wealth. Disasters provide opportunities for anteforces to control the government. The government has to be ready in all respects and in absolute control. Fund collections, espionage, fundamentalism, kidnapping, theft, rape, robbery, exploitation, conversion, political affiliation, cult formation, etc. are all orders of the days of disasters.

14.7 Disaster Prevention, Pre-emption, Preparedness and Response

People are more familiar with disasters that affect them directly. Their response to such disasters becomes conditioned behaviour in the absence of trained and developed programming. Irrespective of technological advancements, incidences of disasters all over the world are on the increase. Disaster management, therefore, is vital to safeguard interests of national security. A logical approach, which incorporates coordinated, integrated and progressive sequence of preparedness measures and related actions, is necessary. The purpose of a disaster management plan is to prevent disasters and to minimise damage to life, property and environment by optimum use of resources when it occurs. Various stages of disaster management are:

- Preventive preparedness
- Pre-emptive preparedness
- Containment
- Response
- Mitigation
- Recovery

Preventive preparedness for each disaster will be different. It covers the measures including planning to prevent a disaster in case the incidence occurs. A well-planned preventive preparedness system shall consist of:

- Mapping the disaster terrain
- Review process of the disaster terrain
- Legislative measures
- Contingency plans for early warning
 - Reporting systems
 - Communication plans
 - Control teams
 - Equipment
 - Resources and assets
 - Casualty procedures
 - Media policy
 - Welfare and rehabilitation arrangements
 - Training and updating programmes

Containment, as the name implies, deals with containing the disaster within its boundaries of maximum damage once it occurs. It is a heavy task, which involves preparing ground for other related management, stages to succeed and public and media relations. The response, on the other hand, is centred on saving life and relieving human sufferings in a contained disaster situation. It also includes:

- Protecting property
- Preventing further escalation (where it was not possible to contain before)
- Safeguarding environment
- Responding to the media
- Keeping the life moving on

Mitigation is primarily about minimising damage subsequent to a disaster while responding to it. Recovery embraces all the activities that are necessary to bring back normalcy. The implementation of recovery policy should begin at the response stage itself. There is no blueprint for disaster management. Each disaster is different, just like each death is. Unexpected will invariably happen, that too when least expected. Such uncertainties can be limited through effective contingency planning. Operational flexibility is the cornerstone of a well-defined, contingency plan.

The plan should follow certain well-established principles:

- Probability of disasters occurring
- Vulnerability of the system
- Progressive sequence
- Effect of the disaster
- Primary purpose
- Additional purpose
- Flexible framework
- Key requirements: communication and information flow
- Publicity of the plan among all concerned

Priorities in a contingency plan remain constant. It depends on the nature of disaster. Planning priorities include:

- Pre-planning for risk reduction
- Critical factors that need to be protected and measures to protect them
- Achievable aim
- Key requirements and prepared action lists
- Response needs
- Recovery needs
- Post planning: resources, finance, training, etc.

The basic requirements of a contingency plan are:

- Flexibility
- Simplicity
- Understandability
- Situation compatibility

Effective contingency planning, against a disaster, is a cooperative process involving government and all those who share the risk and responsibility. Almost all disaster management plans call for multiple activity profile. For example, an earthquake will involve search and rescue, fire control, power breakdown, epidemics control, utility services breakdown, civil reconstruction, etc. The multiple activity profile can take its toll when the activities within it conflict with each other during the execution of the plan. The plan, therefore, needs to be prepared carefully to avoid activity conflict during execution, identification with mitigation procedures for each disaster and the fact that disasters are not isolated incidents. There are patterns that can lead in understanding disasters. They can be region specific or cause specific. Some of these patterns can point a way to identifying measures to prevent them; others may lead to identifying and improving ways to mitigate them. Disaster management needs worldwide attention and import of management techniques from specialised countries. Legislative measures are based on prevention alone. Those who want to circumvent them can overlook them deviously. Legislative measures may regulate the activities, but they neither immunise nor indemnify the society from falling victim to disaster. The government is not the lone agency for disaster management. It needs to identify partners in cooperative disaster management comprising national and international agencies, both governmental and

nongovernmental. Such partnership will bring together the government with organisations of civil societies including grassroots groups, research and academic institutions, bilateral aid agencies, private sector companies and agencies under a designated central coordinating authority for each identified disaster situations. It is a continuous process.

Disaster is a traumatic experience for the victim. Treating the victims is a dedicated job that calls for not only humanitarian aspects but also law enforcement. Majority of disaster scenes are also scenes of crime where victims are looted and deceived by lurking opportunists. Law enforcement and providing legal aid to the victims under such situations are imperative for the effectiveness of a disaster management plan.

Governing disasters can become complicated under various constraints including unpredictability. There are certain unwritten laws that could be followed in disaster governance:

- Disasters will occur—ignoring the danger offers no protection.
- Preparations will never match the incidents that occur: the more complex the preparation, the less precise the match. It is a chance theory.
- Disasters invariably happen at a time of maximum inconvenience.
- Disaster governance can turn out to disasters.

These unwritten laws underscore the uniqueness of any disaster and the consequent need for simple, flexible and co-coordinated contingency planning.⁹⁵ The national-level programmes on disaster management will require inclusion of specialists from various fields supported by law enforcement agencies and efficient administration. The nation has to identify the type of disasters that can strike and the regions prone to them. Appropriate contingency plans have to be prepared to handle them and mitigate damages. Such plans are required at the national, state and smaller levels of administration. The success of any such plan depends upon the law of diminishing damages and increasing prevention in the course of time. A failed plan is the one that doesn't support such advantages. Under such circumstances disasters strike periodically and cause damage as before. For example, an earthquake in a region will fail to bring the attention of the society to the need for earthquake-proof buildings, or a flood situation will recur adding to the miseries and woes of the people periodically. There is no room for complacency or inefficiency in effective disaster management. It is a national task that calls for the involvement of the government and the public together with a degree of awareness proportionate to the intensity and repetition of the disaster. Disasters are terrain and region oriented. The management plans should emphasise all the critical phases of a disaster in a particular terrain: pre-disaster phase, disaster phase and post-disaster phase. The pre-disaster planning includes risk assessment; mapping of disaster types and spots; identifying and assigning roles to various agencies; launching awareness campaigns;

⁹⁵Paleri, P. "Disaster Management at Sea". *Journal of the Indian Ocean Studies*, Vol. 3, No. 3 Society for Indian Ocean Studies, July, 1996, p. 272.

issuing warnings; training volunteers, advocacy and planning; and standardising habitat designs as preventive methods, simulation and exercises. The activities involved during a disaster phase are rescue, first aid, trauma support, distribution of medicines, making the victims know that they are supported, maintaining law and order, sanitation and hygiene, preparing to counter cascading effects, containing rumours, allowing information flow and assessing damages. Post-disaster phase have a tendency to slow down and become complacent in approach. Effective management of post-disaster phase is vital for preventing recurrence of disaster. It includes technical and material aid for reconstruction, rehabilitation, pre-empting exploitation of the affected, financial aid distribution, providing legal aid, monitoring and designing disaster-resistant habitats and reviewing the existing contingency plans from the lessons learnt. Disaster security is a proactive subject. It has to be ingrained in national governance and organisational management. It needs the support of all concerned. It is a social activity that can contribute seriously in elevating the national security index.

14.8 Cost-Benefit Analysis in Disaster Security

Cost-benefit analysis (CBA) is a major tool in the plan to handle an appreciated situation. It is very apt in disaster security because, sometimes, the best way to deal with a particular incident that may not trigger a disaster is to leave it alone. This is especially so with natural disasters. In national security, a human life is priceless. Therefore, in any disaster situation, saving and managing life has to take priority. It is not really subject to the CBA. Unless the consideration is for zero human casualties, all disaster management techniques should be scanned thoroughly for the CBA. Disaster management involves public money that has to be spent cautiously and judiciously. The CBA is an attempt to measure social benefits of a proposed project in monetary terms and compare them with its costs. A cost-benefit ratio is determined by dividing the projected benefits of a programme by the projected costs. A programme having a high cost-benefit ratio will take priority over others with lower ratios. Determining this ratio may involve a wide range of variables. Both quantitative and qualitative factors need to be taken into account, especially when dealing with social programmes. For instance, the monetary value of the presumed benefits of a given programme may be indirect, intangible or projected far into the future. The time factor must be considered in estimating costs, especially in long-range planning. The problem with this method is in determining the benefits in monetary values. Besides, it is not necessary that decisions are always based on the cost-benefit ratio, especially when political compulsions overrule the process.

14.9 Disasters Through History

The world is continuously carved by disaster-prone incidents. Human lives change accordingly. Disasters have often deflected course of history.⁹⁶ Winds, waves and ground have toppled empires. Disasters rip away social moorings as harshly as they snatch children from their mothers' arms. Disasters can induce disorder even within disorder in a country. In the past, around 5500 BC, the Mediterranean rose as the last ice age melted. The sea burst through the hills surrounding a brackish lake to the northeast and created the Black Sea. Seawater poured in for weeks through what is now the Bosphorus, covering human habitations around the lake. In 1600 BC the Santorini volcanic eruption spewed out clouds of ash across the Mediterranean devastating Crete, capital of the Minoan empire, its fleet and its coastal cities. The empire was weakened and conquered by the Mycenaeans of the Greek mainland, who established the model for Western culture. The Moche civilisation, based on desert valleys in coastal Peru, has been constantly weakened by earthquakes and El Niño storms that washed away hundreds of miles of irrigation canals from the Andes. Tiny microbes are more powerful than the noisy disasters. Plague undermined the mediaeval social order killing a third of Europe in the fourteenth century. Typhoons in 1274 and 1281 saved Japan by sinking Mongol amphibious assault forces. Hails, the size of pigeon eggs annihilated a marching army on Reims to crown Edward III the King of France in 1360 and taking the fight out of the superstitious Edward. Invasions of Russia by Napoleon and Hitler were bogged down by harsh winters. According to Paul Saffo, the director of the Institute for the Future, a San Francisco area research group, the 1883 Krakatoa eruption helped Muslim fundamentalists among the Indonesian nationalists already assassinating Dutch colonial planters and fighting their marines. That war was fought hardest in Aceh, on the north end of Sumatra, which practised militant Islam, linked to the Arabian Peninsula rather than the gentler mix of animism. "There was a sense that old gods have failed them".⁹⁷ Disaster does change gods. New disasters form new cults. Rapists and kidnappers prey on survivors. And the world watches the scenes repeatedly, often helplessly.

14.10 Climate Change Attribution

Climate change is a much-talked-about subject, projected as a desperado of sorts to whom the torch of blame is aimed at. Endorsing climate change to humans alone should be done with caution. The part of human-induced climate change could be only corroborative compared to more forceful cyclic changes of nature. But arguing against climate changes need not be meaningful as it anyway is a villain of the

⁹⁶McNeil Jr.D.G. "Will History Repeat Itself?" *The Times Of India*, Mumbai. 4 January 2005. p. 5.

⁹⁷Ibid.

piece—the antagonist in the survival script. But it is important to see that the meek doesn't suffer under the onslaught of the aggressive to suppress them economically in the name of climate change. It will affect their well-being. Human intelligence and opportunistic attitudes can be disastrous in the antagonistic way in proscribing comfort to other humans. A ban or sanction against a government can also snatch away rights and comforts of innocent citizens. That will be bad governance in a global system however informal it may be. So governance has to see a way through climate change in disaster security. These facets have been included in the Agenda 2030 of the UN wisely and prudently. That is good news for the modern sapiens.

On the other side of reality, however, the world today moves around with the belief and assured conviction that the humans will be ultimately responsible for disasters caused by climate change. Climate change will lead to serious consequences whether natural or human induced. By itself, climate change is not a disaster, but the cause for a multitude of perceived disasters that, it is believed, may tear down the world one day. According to news reports, over the next 20 years, climate change can result in global catastrophes costing millions of lives.⁹⁸

Predictions in a media in 2004 for 2020 were big and exceptionally holocaustic. They were also utterly ludicrous when looked back but serious and chilling when predicted. Major European cities may sink beneath the rising seas. Britain may plunge into a Siberian climate by 2020 (humans have already crossed it covidly). There could be nuclear conflicts and mega droughts. This will result in famine and widespread riots all over the world. Food will dwindle along with water and energy. Disruption and conflict will be endemic features of life. At the end of it all, once again in human history, wars will be the determining factor.⁹⁹ Wow!

Why didn't the predictions come true? Why the world is on the path of Agenda 2030 for a better life? Because, the sapiens and their design parameters are not ordinary. Climate change and other constraints to human passage to the future need to be examined under deserving seriousness. But the conviction that humans can ride over them looms large in this study. It can be invoked in governance through national security concept towards human well-being. The predictions of gloom, authenticated and non-authenticated will never end. Almost all over the world, barring a few lone but reassuring voices, everybody spells impending doom by climate change looking at the hazy crystal ball with too much dust on it. This study doesn't endorse doom to humanity and human.

There were incidents that couldn't be denied, though. There were reports that snow appeared on the mountains of Ras al-Khaimah in the United Arab Emirates (UAE) for the first time in 2004 that sent a cold chill in Dubai besides above-average rainfall. So what? Why can't the Arabs get a thaw in the reverse? The mountain cluster is quite high; it is about 1737 m above sea level. The snowfall occurred in December 2004 was understandably "heavy".¹⁰⁰ The temperatures dropped to minus

⁹⁸"Climate Change can Destroy Earth". *Hindustan Times*, New Delhi. 23 February 2004, p. 1.

⁹⁹*Ibid.*

¹⁰⁰The world's Turning Topsy-turvy. *The Times of India*, Mumbai. 31 December 2004, p. 11.

5 that “stunned” the residents. There were also reports that grass (not the one the junkies hope for) is growing in Antarctica for the first time.¹⁰¹ There was news that 25,000 people died in Europe because of heat wave. Raging fires destroyed thousands of square kilometres of forests in Indonesia and Borneo.¹⁰² The climate change, according to some observers, could have also contributed to the reasons for the 2004 tsunami that devastated Asia’s coastal life.¹⁰³ It is premature to conclude that way, though. But according to the World Meteorological Organization (WMO), the freakish weather events have doubled in the last decade. (How does one define freakish when conjured up with a freaky concept—the weather?) A major reason is said to be temperature rise in the world. The average global temperature increased by 0.6 °C in the last century. It is increasing at an even faster rate of 0.1 °C every decade according to views around. The Arctic region is growing warmer. That indicates a danger of melting ice caps at abnormal rate. Arctic ice thickness has decreased 40% since the 1960s. It appears to be accelerating. Scientists estimate that the sea level will rise by 19 inches by 2100 and at the higher side perhaps by 37 inches. About 2 billion people will be at risk of flooding by 2050. About 279 plants and animals are already responding alarmingly to global warming. Species geographic ranges have shifted towards the poles at an average rate of four miles per decade, and their spring events have shifted earlier by an average of 2 days per decade. The studies also show that volcanic landslides generate huge tsunamis that tend to occur during historically warmer times on earth.¹⁰⁴

The problem, the idea of climate change has with the author, is in the perception of cause and effect. Is climate change the cause of global warming or vice versa? This is based on the argument that climate change leads to flooding and then to the next ice age. Of course, the ice will thaw and melt many years later. If so the question is (Box 14.3), “When should Noah make his Ark 2?”

Box 14.3: When Should Noah Make His Next Ark (Ark 2)?

Certainly, Noah has to do it in advance, before the great rains or sea level rise. That is prevention of the disaster incident, not the floods. But what about preventing rains or at least the flood and associated disasters so that there is no need to construct the ark? That is pre-emption in disaster security governance. It is advisable if the weather changes are cyclic and natural. But first, where is Noah?

14.11 So, What Is Disaster Security?

Disaster security, in this study, is the sixth identified element of national security in the chronological hierarchy of 16 elements. Disaster security, “disastersec” in short with the symbol “ d_{s2} ”, is about preventing or pre-empting disasters as defined in this study and mitigating damages caused by them to the best advantage of the human system in national security governance.

A disaster is the incident that causes loss and damage to life, property and environment. Disasters can increase cost of governance, delay developmental plans and in addition bring major changes in behaviour including abuse of power and religious and other exploitations of people. The general feeling of well-being can hit the rock bottom in the event of a disaster.

14.11.1 *Definition: Disaster Security*

Against the background of this study, disaster security means “the capability of a nation to prevent and pre-empt disasters from occurring and mitigate damages if occurred, by minimising loss and damage to life, property and environment and, recuperating fast by governance, perfectly aligned with the other elements of national security and integrated with all the terrains of national governance”.

14.12 Summation

The whole world is a magician’s bag of death, mayhem and disoriented confusion for the living things. What the magi will pull out the next moment will decide the fate of many. It will be an incident that will cause disaster. The only way to avoid disaster is to keep out of it. That’s one of the charters of a government—governing disaster security.

Disaster is a dreaded word that affects the psyche of a human system. But there is another side to disasters. They provide opportunities to the unscrupulous to engage in abusive activities—corruption, fund raising, religious conversion, unethical politics, espionage, subversion, militancy, libelous propaganda, deceptive aids and so on. Somewhere in this chapter, it has been mentioned, “Everybody loves a good drought”. It was the title of an old but strong and still popular publication. The title could be changed to, “Many love a rewarding disaster”. One of the tasks of a responsible government and its disaster management organisation is to deny the rewards to the unscrupulous in the event of a disaster. But it will be difficult if the government and its agencies themselves are involved in it. Because disaster is an exploitable situation for the relatively influential. A feeling that disasters are good for some and bad only for the victims is thriving in the belief system today.

Table 14.14 Disasters that challenge national security

Natural disasters		Human-induced and other disasters	
Earthquake	Heat waves	War	Landslides
Flood	Avalanches	Terrorism	Structural failures
Drought	Forest fires	Militancy	Mining accidents
Cyclone	Accidents	Ethnic conflicts	Epidemics
Tidal waves	Epidemics	Riots	Weapons of mass
Winter chill	Cyclones	Refugee situations	destruction
Landslides	Mining	Major industrial hazards	Pollution
Volcanic eruptions	Accidents	Epidemics	
Volcanic eruptions	Accidents	Economic collapse	FForest fires Major accidents

The disaster management policy under disaster security is not just preparing contingency plans or appointing disaster management teams. Disasters are forceful. They can make citizens highly vulnerable. The consequences of disasters including its impact on people and their behaviour are not documented or studied seriously. In disasters, the government should understand that the victim has a right to relief. The government has an “I owe you” note on them. Unfortunately, the system further exploits the victim as often revealed around the world. There are many incidents when the disaster-affected parties lose heavily. It is more so in induced disasters. An example is the December 1981 “Bhopal gas tragedy”. It has been described as “apocalyptic fruit of man’s megalomaniac greed, incompetence and negligence”.¹⁰⁵ It was the worst industrial tragedy in the world. There appears to be no end to the physical and mental sufferings faced by the survivors, according to reports.¹⁰⁶ The incident gives a jolt to India’s national security index worse than the September 2001 terrorist attack to the United States. Table 14.14 summarises natural and human-induced disasters that challenge national security.

Nature redraws the world repeatedly for its inhabitants. It becomes a problem when the humans get entangled in the game of nature. Many of the 30 billion species created since life began on earth have vanished. More will vanish in the future. The last 2.5 million years have witnessed 17 major ice ages. The periods between the ice ages represented global warming. On the average, the periods between ice ages have been 8000 years. The last ice age was said to be 10,000 years ago. Nature belches more than 30 times more carbon into the atmosphere than today’s human civilisation. Volcanoes and dying vegetation spew carbon into the atmosphere. Today, the world is populated more or less in its entirety. There is no place to move out in case of a disaster. The bottom line of disaster security management is to find ways and means to co-exist with disaster-causing incidents. The collateral damages to human

¹⁰⁵ Lapierre, D. “Do not Forget the Martyrs of Bhopal”. *The Times of India*, Mumbai. 3 March 2000, p. 1.

¹⁰⁶ Ibid.

life, property and psyche are unbearable. Disaster management, therefore, has to be aimed at people to prevent them from falling victims.

In spite of everything the humans could achieve, it is said that the entire world may go into hibernation in its most preferred element—water. Silence will loom over the world when the end comes except for the sounds of water all around. For a moment in the infinity of time, the aquatic life will rejoice in the newly transformed planet. But soon panic will set in the waterworld too when it solidifies into ice. The new ice age will begin for life to start all over again aeons later. The time is not known, but that is when the gods will take a long break. They need it too. But they will ensure humans survive. Celebrities cannot afford to leave their fans.

Chapter 15

Energy Security (Energysec) (e_{s2})

Energy can neither be created nor destroyed. . . It is the ultimate “truth” as of now. If so, one of the solutions for energy sap is zapping the “spent energy”. (Author’s term for regenerating needed energy from spent energy, opposite to energy sap. Zap energy when it is sapping. Zap the sap to regain the desired original.)

15.1 Introduction

Humans need energy to survive that they receive in abundance from nature. Otherwise, they would not have been there, evolving progressively. It also means they won't survive if energy saps one day. It cannot happen; the law of invariance suggests. Besides energy may sap but won't be destroyed. To put in a better way, the law of conservation of energy is adamant about retaining energy as if there is an

“in perpetuity” clause. Every child in school is taught about it. But there is no guarantee they would remember.

The problem is in governance. Governments too face problems that could be different from what governance faces. The scare of a virus can make the demand for oil (which is nothing but a non-polar¹ chemical fuel and one of the energy fuels) to hit rock bottom faster than the time taken for the sapiens to rush back to their caves and hide there or to shoot sky high when a war makes them run to the trenches draining the blood to their feet in fear turning the faces pale and white by vasoconstriction. Both are bad. Both are mathematically a similar state of human condition vis-à-vis energy demand. The demand and supply fallacy of economics very clearly hits a bipolar dilemma here. In the first case, the modern sapiens have no “need” for additional energy because they are locked down in their caves to escape from a virus as on date (2020). In the second, they are shielding themselves in the trenches and need energy to fight the cause, the war, to the end. In the first case, the sapien energy guzzlers are idling without demand. On the contrary, they are starved by combat need. Both situations remove the quality from life; hence, they become identical. But one lowers the demand and the other heightens it, if it is for oil. What does it say?

The finding here is that energy security governance is neither about burning maximum energy nor saving it unit by unit but utilising it in the best possible way for maximum well-being—optimum distribution of available energy—and finding ways to make energy available all the time. This can be seen as an idealistic comment or advice. But according to this book, energy security falls in the realistically idealistic niche. Well, there is a lot more to explore and comment. It is not that people will scramble from Cadillacs to camels or caves or jump from towers to tepees or trenches only when energy supply is over but also under other situations. Whatever, such action can pause energy use even if the resources are in abundance. Identifying energy needs for optimising well-being is a mixed bag of mathematics and psychonomics in a global scenario. It is confusing when to be examined for the same world fragmented by nations.

Whatever, there is an indication for zapping energy somewhere in the nature of universe itself (Box 15.1). So how did it happen with fire?

Box 15.1: The Universe, the Human and I

Stephen Hawking asked a question what one would need to make a universe. His conclusion was matter and energy.² He also mentioned energy was there in the matter too; ($E = MC^2$). So it leaves one with only energy as the answer. The force behind the universe lies in the art of zapping energy. Can human intelligence replicate it in a relatively smaller way like a matchbox hiding a

(continued)

¹Oil contains non-polar molecules that have no separation of charge—no positive or negative poles are formed. The electrical charges are evenly distributed.

Box 15.1 (continued)

huge fire? There was a time when the primitive human stole the reserved fire from the hearth of the other. But it is not clear how they carried it in the darkness of the night. Today humans can steal fire by taking away the other's matchbox or similar gadgets of shored up fire.

15.1.1 Enter the Blaze

The exact date and time are not known, but it was around 1,000,000 BC humans learnt to use fire.³ That was when they realised, for the first time, their lives were changing. The wonder of energy beyond physical energy for human support had happened. Astonishment was writ on their face. No more they were weaker than the animals around them. The nights were not as dreadful as they were before. One could recognise the person lying next to him or her against randomly waltzing flames that defied gravity in the dying hearth in the open. It made them know with clarity whether it was or was not the neighbour's woman or man. Fire gave them the plasmic revolution during orgasmic nights—a kind of organza braganza. They could sleep on the ground instead of up on the trees—the genetic sentinels that will make them feel comfortable even in claustrophobic skyscrapers or apartments in the future after hyperbolic millennia. That was one of the games the trees played with humans as early residential apartments of moderate safety and security.

Fire was mentioned in the chapter on resource security as a resource. In this chapter, it is identified as energy. Energy is a resource but seen as a separate element of national security because of its intrinsic nature and inclusivity. The day the primitive humans learnt to control fire would have been unique. That was the day they would have felt powerful for the first time—a great feeling. Till then, almost 2,000,000 years, they were fighting for survival with Stone Age tools as an extension of their physical (muscular) energy.⁴ Their lives passed leisurely.

With the ability to control fire, every other inventions and discoveries in their lives would now look ordinary. That was the day for one to have been there to feel

³Duncan, R.C. “The Olduvai Theory: Sliding Towards a Post Industrial Stone Age” 27 June 1996. Institute on Energy and Man. <https://www.peakoil.net/publications/the-olduvai-theory-sliding-towards-a-post-industrial-stone-age>. Accessed 23 November 2018. The author's conviction about zeros on the right is that the more zeros it ends shows the more inaccurate the data is. That is one big advantage of zeros which can't divide itself or other numbers.

⁴Perlman, D. Fossils from Ethiopia may be the Earliest Human Ancestor, *San Francisco Chronicle*, 12 July 2001, www.news.nationalgeographic.com. In a recent finding on fossils from Ethiopia, the earliest of the human ancestor was identified to have been alive 6,000,000 years ago in the wooded highlands of East Africa. The find was made by a team of scientists in the Middle Awash River Valley of Ethiopia and was named *Ardipithecus ramidus kadabba*, a subspecies of *A. ramidus*. What is important here is that based on this find of human origin, it took nearly five million years for the primitive humans to gain control over a non-physical (bodily) energy source for the first time.

the amusement, mystery and power by oneself rather than imagining it millenniums later. Probably it was the first time the humans would have understood the power of the omnipresent but invisible energy. (Well, at this point one should know energy is not omnipotent.)

After the first *tête-à-tête* with fire, various sources of energy controlled their lives on the planet. Energy use by sapiens is a sign of their aggressive superiority over every form of life, so far, other life forms, and the ability to shape intelligence to intellect and use as the ultimate survival tool. One day, perhaps, all will be over. “What then?” becomes the critical question people may like to forget now, at least subliminally to avoid disturbing visions about future. Fire—the plasmic fourth state of matter⁵—of course was not the real energy that brought modernity to human life. It took time for humans to become “modern” in life identifying and learning to control new sources of energy. Today, they are still in search of the ultimate energy for quality life, and as in the beginning, it is a long and impatient wait to reach out to new sources. The energy gap in human evolution is too wide; it is longer than generations.

But the fact, rather this study can say, the ultimate truth, remains that humans will never be energy insolvents. It will be around them because energy can neither be created nor destroyed. That is the law about the conservation of energy. It should mean it only gets transformed even when it is used. So, why “one” worry?

15.2 Energy Security: Setting

Energy is power to perform work. It is not strictly a resource but created out of specific resources (matter) to supplement human efforts to perform work. Sapiens are heavily dependent on energy for their progressive existence without falling back on track. Energy acts as the ratchet hook in this climb. Progress needs surplus energy as supplement to sustain. Frequently, the feeling originates about the world reaching the peak in energy consumption. Such findings cannot be discounted. The world is yet to find an environmentally and economically viable source of energy, though. If the time taken from Stone Age tool making to learning to control fire—2,000,000 years—is a rough indication, it will be long for humans to invent new sources of energy. By the time, some of the current favourites that serve as sources of energy need not be there. The study of energy security as an element of national security begins from this hypothesis. The hypotheses on energy security may change with respect to time and scenario. A sample of such hypotheses could be the following:

- Progress of the world depends on energy.
- Quality of life is embedded in energy.
- Energy consumption seems to have reached the peak.

⁵Though mentioned as the fourth state of matter, there are reservations, considering fire is a transformed state of matter as a process of energy combustion.

- It cannot progress further but can only retain the current momentum and slowly decelerate unless a replacement is found.
- Equivalent or better replacement does not seem to be a possibility.
- If possible, it may not be immediate.
- By the time the current energy dwindles, there will not be equivalent replacement.
- There will be a blackout for a long time that will undermine further progress because humans need energy resources to discover and exploit energy (energy needs energy).

Does the last hypothesis make sense? Is it the worst case? Whatever, this may be seen as a pessimistic warning. But pessimists act faster. In other words, if something has to be done, it has to be done fast to avoid energy slip—the period between energy exhaustion and replacement. It is crucial. Energy slip is the blackout period that may block alternate energy discovery and replacement. The candle has to be lit before the power fails since in the darkness of the blackout, the candle may not be located. Identifying new energy is crucial before the current sources of energy deplete to avoid energy slip, because the world may find it difficult to recover once the energy slip reaches the critical limit—the point of no return. According to certain thoughts, energy slip is already set in. Alternate energy sources today are controlled more by forces of economics than forces of energy security itself. It is not an ideal situation from the point of view of pre-empting energy slip. The world may have to divert its attention from many of its current engagements, fancy predictions and inflated ambitions of supremacy of one kind or another. The problem of human intellect is that it is a bit slow (relative to human wants) and also gets disturbed by preoccupation. The energy gap (the period of energy replacement), as seen in the biomodels of history, is a bit longer than human intellectual capabilities. It has to be compressed to speed up. The basic principle of energy security is within this statement.

Energy security is vital for a nation. Under globalisation, energy security has gained significance in matters related to their control. Part of it has slipped out of the hands of governments, especially in the case of oil. Nuclear energy is tied up with non-proliferation and dual use issues. Coal is regulated by environment and nature. There are many concerns. Authorities prefer to skip them for the moment lest they should provide a feel of energy choke in an open world. The issues on energy and resources are serious and will continue to reflect in security policy of all countries. The hope of the world is invested in oil and prayers are that it should flow continuously under modern techniques and favourable economic conditions. But it has to end one day, like the beer in the pitcher.

15.3 Energy and Human Progress

Affluence and modernisation in all ages of human history came from the power of humans to use available energy to their benefit. To quote Isaac Asimov (1920–1992), the science fiction writer, *“Indeed, the ability to control energy,*

*whether it be making wood fires or building power plants, is a prerequisite for civilisation.*⁶ If this hypothesis is positive and acceptable, then the future is predictable. If energy sources are shut, humans will become energy destitutes. Sapien lifestyles will slide back to Flintstones format. That is down a sharp gradient. Well, there could be a difference. They will be advanced primitives, at least in the initial days, helpless by energy sap. And then, generation by generation, they will slowly slip into ordinary primitives with no chance to develop further unlike the other humans who preceded them and stumbled upon fire to begin with a climb on a pyramidal ladder of energy supply. Will it trigger devolution? One may get a biomodel experience in prolonged pandemic lockdowns. Or it may be similar to climbing up from one side and coming down the other as if on a pyramid or a sand dune. This scenario is not tested. It is based on generalisation of a linear hypothesis visualising within limitations. The visualisation may be improper. And that is what any human being would like to believe to rationalise the fear of future. At least the race is safe for a few generations more under the linear hypothesis.

The study and discussions in matters of energy for human development and quality life are dissolved in many theories. One of them is Richard C. Duncan's Olduvai theory.⁷ It stops long of a predicted Stone Age waiting for the humans in the distant future. He looks at it as a cyclic process—stone to stone peaking through energy consumption. Based on a measurable index of world energy use per person, he predicted in 1989 that the life expectancy of current civilisation (period-based human system) was very short. It is an inductive theory based on energy and population data. He named it the “transient-pulse theory of industrial civilisation.” He sketched the theory at its pinnacle in 1990 and then sliding down. He believed the ratio of world annual energy use to world population gave a robust, testable profile of industrial civilisation. He devised a quantitative basis for the theory and gathered several sets of world energy and population data to test it. He named it the “Olduvai theory” which meant the same as “transient-pulse theory,” used in his previous papers. There was a reason in calling it “the Olduvai theory.” It was a metaphor associated with the Olduvai civilisation (again, a particular period-based human system life) in Olduvai Gorge in Tanzania that has been strongly associated with human origins and the Stone Age's way of life. It was widely discussed since the 1950s. The expression only suggests the impending return of the humans to a Stone Age's way of life.

⁶ Asimov, I. & White, I. (1991). *The march of the millennia: a key look at history*. Franklin. p. 125. Here the term civilisation is according to the definition in vogue, not as per this study which considers the term is not based on affluence but intellectual awareness as unitary in the entire human system.

⁷ “Olduvai Gorge.” Britannica Online, www.eb.com. Accessed 3 November 1998.

Olduvai Gorge is an archaeological site located in the Serengeti⁸ Plains in northern Tanzania.⁹ It is a ravine, a steep-sided gorge about 50 km long and 91 m deep. It is a delight for dedicated archaeologists with rich fossil fauna, many hominid remains and items belonging to one of the oldest Stone Age hominids called the Oldowan. The exposed sequence of lake and river sediments in the gorge has a record of the last two million years of eastern African prehistory. The time span of articles recovered dates from 2,100,000 to 15,000 years ago. That is a long span of time. The archaeological beds are in a lake basin that has rocks under dating back to 5.3 million years. The hominids chose a place where water was plenty. The place was initially in the German territory of Tanganyika. In 1959, there was a spectacular fossil discovery—a primitive human that was attributed to a robust australopithecine associated with Oldowan tools. At first, it was called *Zinjanthropus boisei*; the fossil was later assigned to *Paranthropus boisei*.¹⁰

The explorers at first assumed they found the early human being who was manufacturing the Oldowan tools, but over the next 2 years, remains of a more human-like form began to be found. These remains, including parts of a skull, jawbones and hand, leg and foot bones, were assigned to a new human species, *Homo habilis*, in 1964. This species, with its smaller back teeth and larger brain size, was now assumed to be the toolmaker of Olduvai, rather than its contemporaneous *australopithecine* cousin. The dating pinned the oldest human remains and stone tools at Olduvai to 1.8 million years ago, at the end of the Pliocene period. Subsequent excavations found a more advanced species *Homo erectus* at Olduvai, dating around 0.7 million to 1.2 million years ago, sometimes associated with hand-axe tools. With all these findings, a continuous record of history has been found suspended in Olduvai and the gorge continues to figure prominently in the story of human evolution. The entire chapter of generations and their development lay written beneath the earth in Olduvai.

Duncan's theory based on the Olduvai civilisation divides the world into various time frames of evolution with respect to energy equilibrium that he prefers to call the Olduvai signature.¹¹ The quest came from the innermost feeling of what happens to the world next when the energy resources are exhausted. The energy resources include all what the modern world is encountered with: coal, oil, gas, nuclear, hydel, ocean generated, wind and everything else. Will it happen, or will it be that one source will replace another? Or is there a chance of a new form of energy yet to be identified making a sudden appearance? Will it be chance driven? Even then there

⁸Serengeti means “endless plains” in Maa (also known as maasai), the language of Maasai people inhabiting part of Kenya and Tanzania, Africa.

⁹www.emuseum.mnsu.edu, 1 March 2003. The theory is a hypothesis based on world energy use per person. Duncan named it the transient-pulse theory of industrial civilisation. In this theory of 1989, the maximum point was sketched at 1990 followed by a persistent decline.

¹⁰Microsoft Encarta Encyclopaedia, 2002, CD-ROM.

¹¹Duncan, R.C. (1996). “The Olduvai Theory: Sliding Towards a Post-Industrial Stone Age.” Institute on Energy and Man. <https://www.peakoil.net/publications/the-olduvai-theory-sliding-towards-a-post-industrial-stone-age>. Accessed 23 November 2018.

has to be an end to it all. How fast will it be? Such questions hang on and people attempt to find answers to them often contradictory and based on belief systems and preoccupation with the subject.

What if the world exhausts all its energy sources? Will it be a mass return to the Stone Age or a return by turns? Will it bring an end to culture and materialistic life? Duncan feels that the decline and fall of the current (industrial) civilisation will be different from the past. The rise and fall will be exponential. He found that the industrial civilisation was not leading to sustainability. It was going in the opposite direction. If that is so, the question in reality is, "How long will it last?" A compilation by Duncan showed the calculations varied in personal appreciation of the energy depletion. The estimated life expectancies of the current civilisation, according to various forecasts are:¹²

- 39 million years (Haldane, 1927)
- One million years (Drake, 1969)
- Potentially millions of years (Watson, 1969)
- About 200 years (Arrester, 1971)
- 100–200 years (Meadows et al., 1972)
- About 100 years (Leakey, 1977)
- Short to 10,000 years or more (Crick, 1981)
- Extremely short to very long (Laszlo, 1987)

The entire range of predictions wobbles on unseen and uncertain parameters. Otherwise, such wide deviations are not possible. It ranges from 100 years to millions of years. But what everyone is sure is about the fact the energy resources will end one day. Surprisingly, this could also be wrong or at least the way the perception is arrived at could be seriously faulty for the reason that there is identity of mind, but lack of conclusion in a system where the findings are on a problem that cannot be factually determined. There could be many uncertainties that may prove it otherwise. Assuming the assumption is right that the energy resources will blackout one day, the process is to find out the way the world has been developing under energy support. Duncan (1989)¹³ divides human history under the energy phases as:

- *The pre-industrial phase*: A very long period of equilibrium when economic growth was limited by simple tools and weak machines.
- *The industrial phase*: A very short period of non-equilibrium that ignited with explosive force of energy when powerful new machines temporarily lifted all limits to growth.
- *The de-industrial phase*: That will come soon during which the industrial economies will decline towards a new period of equilibrium, limited by the exhaustion of non-renewable resources and continuing deterioration of the natural environment.

¹² Ibid.

¹³ Ibid.

The measurable indicator that Duncan used was “world average energy use per person.” According to him, the current civilisation peaked in 1990. The finding was not tested by any hard data. But he had observations justifying the argument. Simultaneously in another article, the world peak of average energy use was identified to be 1973.¹⁴ According to the authors (Gibbons et al., 1989), the decline has already started. In a subsequent article, “The Life-Expectancy of Industrial Civilisation: The Decline to Global Equilibrium” (1993), Duncan concluded that:

- The current (industrial) civilisation could be described by a single pulse wave-form of duration X, as measured by average energy use per person per year.
- The life expectancy of industrial civilisation was less than 100 years. In this calculation, he has shown the steep curve between 1930 and 2025.¹⁵

Duncan admitted that data was lacking. Duncan’s research further was with more data—both energy and population. This resulted in the Olduvai signature. The British Petroleum and United Nations data confirmed that world per capita energy use had peaked in about 1978 and declined subsequently. Only the Olduvai theory could explain the peak and decline. In contrast, both the “exponential growth theory” (of “mainstream” economics) and “steady-state” theory (of “Utopian” economics) failed.¹⁶ Further research again indicated the peak year as 1978. Here, Duncan used the ratio of world energy use to population as indicator. The Olduvai theory prevailed in all thesis researches.¹⁷ The theory propounded that the world against energy utilisation goes through a cycle that covers a pre-industrial, industrial and post-industrial periods, in which in the industrial period, a period of affluence and happenings was very short, so short that it was almost negligible in human existence if the future was to be believed. The world, a millennium later, may not even know that once upon a time, one of their ancestors had landed on the moon (Well, there are many in the world who do not know about it even today!). According to Duncan’s graph, the pre-industrial phase is from 3,000,000 BC to 1765 AD, a very long time indeed. This period covers the tool-making period (3,000,000 BC), use of fire (1,000,000 BC), Neolithic agricultural development (8000 BC) and further the steam engine¹⁸ development phase till 1930. The slow climb to industrial period starts

¹⁴Ibid.

¹⁵Ibid.

¹⁶Ibid.

¹⁷The research was not restricted to Duncan alone. Three other researchers Robert H. Romer (1985), J. H. Gibbons (1989) and F. M. Wright (1996) dated world energy consumption peak at 1979, 1973 and 1978, respectively. All these findings showed a period between 1973 and 1979 as the time when, according to calculation, the barrels of oil equivalent (BOE) per year per person peaked. www.dieof.org, March 2003. The average year is 1977 with an average peak value of 11.45 BOE.

¹⁸The first crude steam powered machine (not technically an engine) was built by Thomas Savery, a military engineer of England, in 1698 to help pump water out of coal mines. The steam generated was used directly over water to push it out. The steam engine was developed over a period of about a hundred years by three British inventors.

thereafter with the improvement of steam engine apparatus by James Watt in 1765. The period 1765–1930 was not counted in the actual phase of the industrial period since it was a case of growth and not sudden upshot. The upshot started in 1930 when the per capita energy use peaked at 37%. The energy use increased further and reached maximum in 1978 from where the decline started. The industrial period will last till the per capita energy use returns to 37% according to the theory and spread out to the post-industrial phase thereafter. The end is predicted at 2025. By then, industrial civilisation is expected to disintegrate into farming villages, kinship tribes and rogue bands. The surviving population would have “achieved” permanent sustainability—at the subsistence level. The prediction is in a linear mode. There will be many chaotic attempts to get back as the future is unbelievably frightening in this prediction. But all the attempts are expected to fail. It is expected to last around a millennium. The world will retreat to the final phase of the post-industrial phase similar to the Stone Age in many respects around 3000 AD.

The question in Olduvai theory is not what’s next, but when? The idea is linear, but allowances need to be given for lateral framework in logical thinking and element of chance variables in any calculation. According to evidences, no human has ever been on the moon before the American astronaut Neil Armstrong stepped on it on 20 July 1969. Or was there another occasion that the generations of the ongoing civilisation were not aware in the Olduvai imbroglio? Were the last Stone Age humans the final descendants of a highly civilised life form? No, it cannot be. That is by logical reasoning intermixed with available evidence and of course a sense of frightening perception. The fact remains that a resource when seriously depended upon can haunt once life after it is exhausted for some good time. That is a problem. But humans defy devolution of any kind and decline to decline. Weren’t there empires and emperors who built mega structures and lived in high spirits throughout the night engaged in gluttony and lascivious orgies in a world without electricity? They called it good life, though in dark sans energy.

But “what if?” could still be the question in the mind of the ever-anxious human. If the Olduvai theory is the lineament of times to come, then the world has to get into serious thinking now, though the theories of Olduvai may be interesting and difficult to imagine. The Olduvai argument insists on the following:

1. The world per capita energy use reached a maximum value between 1973 and 1979.
2. The decline started thereafter.
3. This decline will continue because population growth rate is likely to exceed the energy growth rate unless reversed. The theory will fail here in that case.
4. If the decline continues, humans will get a one-way ticket to the Stone Age theme park where they will settle down.
5. Or it may not happen at all because there is error in the peak energy consumption calculation or it is not the basis of finding the correct forecast.
6. It also may not happen if the data in the future is subjected to non-linear variations in a world that declines to decline and determined to progress.

There is a disturbingly realistic method, which was never seen by the proponents of the Olduvai theory—biomodeling. It is disturbing because of the subliminal fear of the consequences if the test proves the Olduvai theory is right. The hypothesis in this study is that it may not be. Human behaviour is beyond statistics and mathematical reasoning. It is visible by biomodeling, a technique not yet perfected for decision-making. The conditions and facts can be measured from the outcome of a situation in which humans are involved. The situation has to be simulated in real-time mode and not artificially or scientifically. For example, the condition of a country after micronisation or macronisation can be seen close to accuracy if a commune or society within a country is temporarily separated or unified by a natural process—by a government order for example. This will serve as a biomodel for a larger issue that could be seen. Afghanistan was a biomodel for the United States for the invasion of Iraq to end the regime of Saddam Hussein.¹⁹ Vietnam should have been a biomodel for India before deciding to engage a peacekeeping force (1987–1990) in Sri Lanka to disarm militant groups, using force if required, in the middle of a civil war. The misadventure costed the Indian armed forces 1165 lives in action with 3009 injured.²⁰ The advantage of biomodeling can be seen in the least expected situations and the humans often learn from it without being aware of it.

Biomodels are basically real-time situations in human systems. The behaviour of humans in an identified biomodel related to energy decline will show absolute panic within. The symptoms of molecular Olduvai will be visible. Pause to think and look at the way people change their behaviour—think about oneself in that situation—in minutes under certain conditions of energy impasse:

- World Trade Centre, New York, on 11 September 2001 when the terrorists attacked the buildings—*no way to run*.
- Power failure in a crowded and steamy city with no signs of return—*a feeling of choking and isolation*.
- A lift (elevator) stopped halfway and there is no sign of help coming—*claustrophobic trauma and the fear of the unknown*.
- A natural disaster, like an unexpected tsunami that just hit the coast—*the world has come to an end; where is death?*
- A hijacked aeroplane in a remote airport without any facility—*choking at the oesophagus*.
- A strike by the transportation people in a metro while in a hurry to catch a flight—*patience running out and the world crumbling around*.
- Cancellation of flights and passengers already checked in piled up in the transit lounge—*shift to primitive tribal conglomeration with all manners forgotten*.
- Choking of water supply in a metro—*any water will do when thirsty*.
- Hostage situation in the Russian carnage in Beslan by terrorists—*frozen in an ice age bunker unknown about hours left before death*.

¹⁹Of course, a hypothesis. Therefore, “denial” is accepted.

²⁰Indian Peacekeeping Force. https://en.wikipedia.org/wiki/Indian_Peace_Keeping_Force. Accessed 12 May 2020.

- A knock on the door in the middle of a sexual act—*anger and the feeling that everything has come down, both literally and figuratively.*
- In the middle of a festive crowd near the coastline and there is a shout that a tsunami is approaching—*panic and stampede of humans similar to a pack of deer under signal of an approaching predator.*

If this is not sufficient, imagine a nuclear accident or dirty bomb explosion in the neighbourhood and how people in far distant places scramble for cover like worms. It will be worse than the Olduvai leisure. It is predicted that the terrorists may succeed in full-scale nuclear and bioterror attacks and wipe out cities that may lead to the accelerated collapse of energy supply. Afghanistan almost plunged into primitive life during the Taliban regime (An Olduvai biomodel?). Plunging into such a primitive regime was never under a linear, arithmetic, geometric or even powerful exponential progression. It was acute randomness that hits at the dawn of a selective moment. That could happen any day in human life without warning.

Psychologists, anthropologists and everyone connected with human behaviour have unanimously concluded that human beings are highly controlled by primitive instincts and such behaviour surfaces under certain conditions. While it has been considered as a carry forward behaviour or the leftover part of ancestral life, it could also be an absolute necessity for adaptation to the real-life environment that is just a few years away. Perhaps the real lives of humans lie in this primitiveness. That confirms vaguely the journey of the humans from primitiveness to intelligent primitiveness. With these buried instincts, they will be able to cope with the situation without difficulty at least till the second generation of the settlers of the new Stone Age. They will be the new Flintstones. The famous cartoon strips like the “Flintstones” and “BC” actually project the immediate Olduvai world. It should be a good life if cartoonists are to be believed. The Flintstones are a breed of primitives who are intelligent and affluent, whereas the “BC” projects primitiveness with intelligent and intellectually inclined people. Both could be there when the mummies of the Olduvai resurrect. The hypocritical ways of life will still be evident among intelligent primitives, though they may scratch their genitals in public without inhibition.

Everyone involved in such situations gets a relatively brief peak at the Olduvai, like the wild goats in a canyon. It is very clear in the Hollywood movie “*Day After Tomorrow*.”²¹ The movie conveys a message, when the people of the United States are forced to take refuge in the “lowly” Mexico in a crisis when the arteries of energy and resources burst in the most powerful country in the world. These biomodels can give light to the effects and the cascading effects that follow in a system where parameters of life change as quickly as the supporting parameters. Energy is a close supporting parameter of quality life. While the biomodels explained above are naturally occurring ones, it is also possible to create such models in real life, involving real people, for experimentation.

²¹ The movie (2004) directed by Roland Emmerich narrates the plot in which a climatologist tries to figure out a way to save the world from abrupt global warming and subsequent new Ice Age.

Another argument that may favour the Olduvai theory is that such a situation does not have to wait for energy resource depletion in the natural process. It could happen faster by the game of chance. There is 50% chance in any game unless it is governed by more than two factors. Even then, one could conjoin the factors to make it two: yes or no. Here, in the case of Olduvai argument, it is a “yes–no” situation. The chance is big. A depletion of energy resources by chance before finding alternate energy sources can accelerate the signature towards the stone binge. The Olduvai principle brings the theory in various contexts under the yes–no situation:

1. If correct, the humans are heading for an intelligent leisurely life with the same problems as experienced today, but in a far less affluent way, which is certainly not acceptable for today’s humans except the escapists in search of nirvana. They too will dislike it subsequently. But there is no choice except to re-load and sharpen the primitive instincts and get on. The superpower may last a little longer before merging with other buddies in the cave. There will be no globalisation or global security business, thereafter. Outsourcing across the world will be a thing of the past. Diplomacy may not find any takers, because no one may need anything across borders. The borders of nation states will shrink. But the people will be genetically more advanced than their ancestors who lead an affluent life in the energy-empowered world. They may read about them written in handmade books. That will be Mosses revisited.
2. If wrong, the humans are in an advancing plane of civilisation with colonisation of worlds across the terrain of outer space. New energy sources, probably renewable bioenergy as never seen before, may replace all other energy sources. The national security concept will take a turn to national empowerment under a singular global security concept—the *Day After Tomorrow* syndrome, when the superpower will merge with all others.
3. In the most likely scenario, hectic activities will be on to identify new energy sources. The change of direction of the world will depend upon the results of these efforts. If that has to happen, the time is now. Duncan had already explained these frantic efforts. It would be only a flicker before the final road to Olduvai. The world may be at crossroads. But in the most probable case, it will follow the right course. This is not optimism, but sheer faith in human survival based on intellect and knowledge.

The consumption pattern of energy resources is a much debatable aspect. Generally, there is a worldwide argument about overconsumption of energy resources. According to a report, humanity would be living beyond its means without non-renewable energy sources such as coal and oil. According to a study, the population of the world in 2004 is already over the limit.²² By using a method termed as ecological footprint, the scientists calculated the area of land needed to maintain the current level of consumption. It included the equivalent area, which

²²“Humanity Living Beyond Its Means: Scientists.” *The New Indian Express*, Hyderabad. 26 August 2004, p. 14.

would be needed to produce the energy—now coming from coal and oil—on a lasting basis. Their result showed that the “ecological footprint” worldwide was already 20% larger than the area of land available. Therefore, if there are no non-renewable fossil fuels, the current level of consumption cannot be maintained. Each inhabitant needs a particular land area to cover individual consumption that depends upon population strength. The world average in 2004 is two hectares per inhabitant.²³ Availability is less than that. It will further shorten with population increase.

If that is so, the current pace for alternate energy research needs to be accelerated world over. The probability of success of this research will be proportionate to the pace because energy is required for energy research. This perhaps will have to supersede the pace of all other research projects—it is like hastening the work on a laptop when the low battery warning sign is on.

15.4 About Energy

“Energy” in the context of energy security is about the resources of energy. The resource of energy is “matter”²⁴ that has mass and exists in one of the four natural states—solid, liquid and gas. Everybody knows it. But energy, as it is, is the power or heat derived from the energy resource. Humans use energy to do work. Therefore, energy security, at the moment, is about optimally governing the resource from where usable energy can be derived. According to physics, energy is the conserved “quantity” in matter that can be used to perform work including heating.

Taking a detour here, the author invites the interested for a discussion. Others can skip this paragraph. What if one argues that energy is not conserved in matter alone? Will it shiver the timbers in the famous equation $E = mc^2$?²⁵ If plasmic state has mass, does it mean it has energy too? No, it shouldn't be. Then, the whole system will go topsy-turvy: physics, metaphysics, spiritual physics, yoga physics. . . , well everything that gives a free hand to everybody to talk on energy. If it has mass, can energy be refined from energy? Can one go further, say somewhere which is not matter (well, not yet sure)—outer space? Energy should be there in space too because space can't be there without matter occupying it. One may call the energy in “empty” space by any name—grey energy, black energy, negative energy or anything that is “energy.” Look at an idealist example. Kids (including those among the grownups) make sand castles on a beach. Sand castle is matter. One feels the

²³ Ibid.

²⁴ Matter also has other states: 15 modern states and one very high energy state. But basically the first three natural states are significant.

²⁵ Albert Einstein's energy equation that says energy equals mass times the speed of light squared. According to this equation, energy and mass (matter) are interchangeable; they are different forms of the same thing. (In international system of units, the energy E is in Joules, the mass m is in kilograms, and the speed of light is in meters per second).

burst of energy when one kicks it. Of course, the kick also needs energy. But what interests the author is that the moment one makes a sand castle, a moat comes around it for free. If one creates space, one could get matter. Can't one make an island or coastland while dredging a navigational channel? It has to have the zapped energy in it, in the opposite. . . Well, "zap energy" is the author's term for sale. No takers? Fine, but don't call the energy that is there in outer space as negative energy unless the energy that is about to be discussed here is qualified as "positive energy"—suggestion, of course. Zap energy is energy that is unfolding. If it can be taken as something true, then it will make the reader forget Olduvai, unless something else makes it. Olduvai is the finding of a genius from where one gets the thread to unfold further. That is what is (being) done.

It would have been crazy for those who came through the detour. Once this crazy insane discussion is over, one can look closely about energy within the context of this study. It is classified and measured in different units. Primarily, energy is identified as renewable and non-renewable since it is identified as resources and not as the agent for driving work in one form or the other. Here, energy for governance purpose transforms into the resource which could be zapped. Renewable energy resources are those that are bounteous and likely to be there replenishing the energy bank for a very long time to come. The level of non-renewable energy resources will keep falling whenever consumed. Renewable supplies of energy are considered to be the sun, wind, water, biomass, geothermal sources and ocean—waves, current, tide, thermal variations, etc. Large-scale exploitation of renewable energy resources is yet to be effective for technological reasons and the inertia caused by the perceived abundance of non-renewable energy resources. The non-renewable energy resources are currently exploited in large scale and for all primary energy needs. These comprise fossil fuels—coal, oil and natural gas. They are organic and contain mixture of carbon and hydrogen, hence termed hydrocarbons. They are in large varieties and exist in three states: solid, liquid and gas. The hydrocarbons are high-grade energy sources.

Biological energy (bioenergy) is of a different kind. It lives, rejuvenates and dies. Though the energy in national security concept is the energy supplements, the bioenergy, the possibility of biological energy manifestation in extreme cases of desperation when other energy resources dry up, cannot be underestimated. The principles of converting biological energy equal or more than other sources of energy output could be a mind-boggling question. Nuclear energy is based on the availability of fuel, though considered unlimited. These are the primary energies that may get converted into secondary energies for useful purposes: heat and electricity. Under the sagging energy scenario, the humankind pinned its hope on renewable energy as the energy of the long distant future. Their economical exploitation is still a far distant dream.

15.4.1 Renewable Energy

Renewable energy is the hope of the future, experts say, especially when current resources of non-renewable energy are depleted or economically not viable to extract. There are different types of renewable energy resources. Ideally, renewable energy resources are those that will not exhaust if used in a sustainable manner or will remain for an inestimable period of time. The advantages of renewable energy resources are their largely boundless availability and relative compatibility with environment. There could be many renewable energy resources. The compatibility of renewable energy resources juxtaposes the relative incompatibility of non-renewable energy resources. That means the more the world depends upon non-renewable energy sources, the more harm it will cause to human environment. Therefore, a switchover early is always a better choice. Currently identified and exploitable renewable energy resources are briefly examined below.

15.4.1.1 Sun

The ultimate solution to future problems related to energy is believed to lie in the sun as solar energy. Solar energy will far exceed the world's demands many years ahead in time. It is free energy and perhaps will solve all the world's energy problems if tapped economically. The genius in the humans could find a way to tap the sun's energy forever and improve further on it like it happened with oil. The only difference is that, this time, it is unlimited. It is not that the humans have never used solar energy. In fact it is used, in a primitive manner, since prehistoric times and as an identified energy resource in a limited manner currently. It is used in active and passive heating systems and to generate electricity. It needs to develop further, if scheduled to replace non-renewable resources.

15.4.1.2 Wind

Windmills and wind-driven irrigation systems are not new to the world. Wind turbines are producing electricity. A more efficient method that can convert a higher percentage of wind energy into mechanical or electrical energy is what the designers are looking for. The popularity of wind energy machines, however, will be limited to certain geographical areas in the future. They will supplement energy requirements.

15.4.1.3 Water

The moving water is a powerful source of energy. The hydel power stations and wave and tidal energy of the oceans can be effectively used to generate electricity. Among them, it is only the dams that have been constructively used all over the

world to generate electric power besides being useful to irrigation. The total world energy potential from dams is equivalent to 5.5 billion tonnes of coal equivalent energy per year (2004).²⁶ Dams are also designed for flood control. There is also opposition from environmentalists and other activists to the construction of dams. The opposition is based on demographic issues and disaster situations. Dams in certain places are said to induce earthquakes due to their large storage area and associated water load on an unsettled earth. Large dams also cause mass displacement of people including indigenous people from their natural habitats. Many dams are blamed for destroying virgin ecosystems. Mini hydel projects in closed- or open-loop systems are becoming important worldwide because of their affordability and ease of construction and maintenance. They are also eco-compatible. Such projects could substitute capital-intensive and socially and geologically misbalancing mega dams.

15.4.1.4 Biomass

Biomass is basically biological fuels, including gas generated by them. Currently, the contribution is very limited. They are not seriously considered for world energy output demands. At the same time, biomass is actually the fuel of the past that is still incarcerated and will remain even during the Olduvai age of the future, if such a transformation is a reality. From the advanced scientific point of view, biomass can be made into practical fuel commodities for limited uses in the form of briquettes, cakes and nuggets. The demand for biomass energy resources could be there throughout, though supply will be very limited. There are advantages and disadvantages with biomass. In fact, biomass is made into fuel by solar energy in certain cases. It is also the best way to manage the environment by waste disposal, because most of the biological wastes can be converted into energy.

15.4.1.5 Geothermal Heat

The earth's interior is hot, extremely hot; never go there. There are three reasons for this molten state of affairs. One is the original heat, when the planet was formed and accreted remains insulated under the crust. Second is the frictional heat caused by a denser core material that sinks into the centre of the earth. Third is the heat caused by radioactive decay of the elements. The geothermal heat is associated with certain aquifers, hot bedrocks, sources of geysers and steam generators under the rocks. They are conventionally called hot water systems, hot rock systems and wet and dry steam systems. The heat at the core of the earth is around 60,000 °C. That is energy compacted enough to heat up water in certain areas that will make the earth whistle like a kettle. The result is geysers and hot springs. There are areas where steam is

²⁶ Anjaneyulu, Y. (2004). *Introduction to environmental science*. BS Publications, p. 179.

trapped and could be drilled for use like a boiler. It is steam that could be brought out without any damage to the environment. Economy, of course, is a matter of research and more research.

15.4.1.6 Ocean

Ocean is a perennial energy bottle. The oceanic wind, tide, waves, thermal differences, etc. are all packed with energy besides non-renewable energy under the seabed. Perhaps many may not know that ocean also has seas of fresh water in it. There are technological limitations for their economic exploitation of the ocean, though.

15.4.1.7 Hydrogen

Hydrogen as energy fuel is a serious contender for the future of energy. It can make a fundamental difference in energy use if developed for economical consumption. In all its probability, hydrogen as a fuel may first appear commercially on the highways of the world with automobile industry opting out to hydrogen fuel cells. It will be absolutely non-polluting. The power from hydrogen fuel will be converted by an electric motor as per the ongoing programmes on hydrogen fuel cell research the world over in developed countries. The hydrogen vehicles will use space technology transfer and will not use combustion and may also limit moving parts. Hydrogen will be a cleaner, efficient, flexible and reliable fuel that will ensure energy security along with environmental viability. It has the potential to eliminate carbon dioxide and other greenhouse gas emissions. It can be used in combustion process in addition to fuel cells, thereby in a broad range of energy services—lighting, transportation, heating, cooling and cooking.

15.4.1.8 Nuclear

Issues related to nuclear energy in a world that is ever suspicious and keeps a sharp watch on anything to do with nuclear and associated dual-use technology are well documented and argued. But nuclear energy for peaceful use can be a dependable energy companion for humans. There are possibilities of nuclear energy becoming the most-sought-after power source in the world. The date nuclear energy will be acceptable without suspicion could be distant, though. In spite of these limitations, nuclear energy is being used today in parts of the world. It is dependable and safe. The technology exists in the finest possible manner. Nuclear power provides about 16% of global electricity (2004).²⁷

²⁷ Ibid., p. 201.

15.4.2 *Non-renewable Energy*

Non-renewable energy resources are natural resources that cannot be readily replenished. Most of them are fossil fuels. Carbon is the main element in them. Their importance is briefly examined below. They are coal, oil, oil shale and natural gas.

15.4.2.1 Coal

The largest proportion of available fuel reserves is in the form of coal. The established reserves in the world are about 8.8 trillion tonnes. An interesting study is that coal alone will be able to sustain world energy needs for another 200 years assuming the demand will be about 10 billion tonnes per year.²⁸ (What then Olduvai?) Compared to coal, oil reserves show a lowered period of sustenance. The estimate is 60 years for oil and 10 years for natural gas.²⁹ The reserves are not evenly distributed or balanced in national power.

15.4.2.2 Oil

By 1968, the world had produced the first 200 billion barrels of oil since the production began 109 years ago. Since then, the production was at a rate of about 22 billion barrels a year.³⁰ That is how the energy growth shaped the world. A broad estimate of world distribution of oil is given in Table 15.1. The total oil distribution includes production, reserves and undiscovered sources. The figures can vary with new discoveries and changing pattern of consumption worldwide.

The table gives total world distribution out of which it is estimated that about 77% of oil has already been discovered and 30% consumed. Under this estimate, there is oil till the middle of the twenty-first century. Thereafter, production, as per calculations, should decline.

The Middle East has the largest estimate: about 41%. North America is a distant second but already produced almost half of its total oil. Eastern Europe, because of the large deposits in Russia, has substantial stock. Most of the oil of Western Europe is under the North Sea. Others have relatively moderate amounts of oil. Large undiscovered oil resource is believed to exist in North America. Finding of large oil deposits in other parts of the world in the future cannot be discounted. According

²⁸Ibid., p. 144.

Indonesia	15.2	5.8	10.0	31.0
Norway	6.3	11.3	13.0	30.6
United Kingdom	12.3	4.6	11.0	27.9
Algeria	9.1	9.2	2.0	20.3
Total	621.6	1052.3	449.0	2122.9

to Encyclopaedia Britannica (2004) findings, 18 countries produce substantial amount of oil in the world. They are given in Table 15.2.³¹

³¹Encyclopaedia Britannica. Ultimate Reference Suite, 2004. CD_ROM. The figures were adopted from Oil & Gas Journal and US Geological Survey.

These 18 countries have accounted for 86% of the world oil production. Together they hold 94% of its reserves. Significantly, they are projected to have 82% of the world's remaining undiscovered oil resources. As can be seen, regions geologically favourable to the generation and deposition of oil are fairly rare.

The world is aware of its (over)dependence on cheap oil for energy and that the end is near. But the predictions in the past, especially in the 1970s proved wrong.³² Estimates of reserves can be distorted, production may fluctuate, consumption may vary, and the ability to explore will be restricted by the oil available among other factors—it is said that technologically production fails when half the crude is gone. The world oil production peak will be a deciding factor in energy conservation with respect to oil. However, it is not easy to interpret it since the production peaks are also in a different way the technological capabilities for economic exploration and production. The demand for oil will continuously increase and technology will be a determining factor for production. Technological innovation also consumes energy. It is a vicious circle. Models are required for forecasting the world oil production and predict the peak years for every oil-producing nation to understand the slide thereafter.

15.4.2.3 Oil Shale

Oil shale is a solid organic chemical compound from which liquid hydrocarbon can be produced. It is a sedimentary rock containing kerogen, a kind of coal. The liquid hydrocarbon, shale oil, can be produced from kerogen. Shale oil is a substitute for conventional crude oil but costly to extract besides being more harmful to the environment. Shale industry is quite prominent in many countries.

15.4.2.4 Natural Gas

Natural gas is competitive and about 50% cheaper than liquid fuels like naphtha.³³ It needs a lesser power (personnel and mechanical) for handling. Gas is flexible and can be made to run on alternate liquid fuels without major technical modifications. Gestation period of a gas-based plant is significantly shorter than that of a coal-based or hydrogen-based plant. Gas is clean and less polluting than oil, coal and other liquid fuels. Gas has the capability to replace oil in the future, and many nations have good reserves of gas hydrates—combination of methane and water at low

³² Campbell, C.J. and Laherrere, J.H. "The end of cheap oil." *Scientific American*, March 1998. Prices of oil nearly tripled with the Arab embargo in 1973 and then again in 1979 when the Shah of Iran was dethroned. According to certain studies, by 1973, the world had consumed only about one-eighth of the total endowment of readily accessible crude oil.

³³ Gupta, A. "The Dash for Gas." *Business Today*. 11 October 2004, p. 130.

temperatures that exist onshore and offshore gas beds. Gas hydrates can be synthesised by simulating low-temperature and high-pressure conditions.

15.5 Expressing Energy Consumption

The energy value of fuel is given in joules (Joule Standard Unit) or other units, British Thermal Unit (BTU), calories, electron volt, watt, kilowatt-hour, etc., depending upon the unit of measurement. In terms of calorific value of energy content expressed in mega joules per kg, methane is the highest (56 mj/kg) with lignite and cellulose at the lowest (14 mj/kg). Close to methane are the petroleum products with petrol (56 mj/kg) on the top. Energy consumption can be expressed in many ways. Primarily, it is expressed as equivalents of the two important fuels: coal and oil. Global energy consumption is also expressed in higher values. A standard higher unit is a quad equivalent to a quadrillion (10^{15}) BTU. Energy equations for oil are:

- (a) One barrel of oil = 35 British (imperial) gallons
159.11 L (one British gallon = 4.546 L)
42 US gallons (one US gallon = 3.788 L)
- (b) One tonne of oil = 1000 L (about 6.29 barrels)
- (c) One tonne of oil = 7.3 barrels

Energy is consumed primarily in five sectors: industry, transport, research and development, households and general segments including agriculture; strategic energy use and reserves are not included. The energy demand of the world is certain to grow with advancement of the world. The fossil fuel domination is expected to undergo change with a range of fuels as the demand increases and common resources deplete. Firewood, coal, oil, natural gas and nuclear energy contributed to the world demand of energy in the last half of the twentieth century. Options for other sources—solar, tidal, wave, wind, etc.—are slowly unwinding. Forecasting energy requirement for the twenty-first century is a major task. Variable parameters are too many. Extrapolation of historical performance cannot be accurate. There is a move away from environmentally dirty fuels to clean fuels. This means carbon has become a dirty element for the environment. Decarbonisation is the solution.

15.6 Energy: Status and Trends

Oil is the world's prime source of energy. Many countries export oil. It will continue until appropriate replacement is found. The increase in the number of countries exporting oil dilutes the power of Organisation of Petroleum Exporting Countries

(OPEC).³⁴ The market forces rather than command economies will drive the production decisions in some parts of the globe under this scenario. In other parts, the regulatory procedures will be loosened. There are occasional upheavals in prices in the market. There are silent market wars to gain control over energy supply. Governments struggle to keep the price in place that sometimes may outgrow resulting in inflation which obviously is not welcomed in political situations.

Crude oil price fluctuates. It fell in late 1997 and stabilised in early 1998. The lower prices of oil were attributed to lower production costs.³⁵ The cost includes that of finding oil and gas reserves, exploration, production and transportation. The cost of finding oil is primarily in modeling and sensors. The cost can be reduced by technological governance. Technological upgradation of oil exploration made many unattractive oil wells favourable. This has increased global oil production.

The case has become curiously interesting for energy watchers with the twenty-first century pandemic upheaval. The average oil price was USD64 per barrel. It became almost half in 2020. The shock came on 20 April 2020 when oil prices went into a coma with the price falling below zero for the first time in history defying economics.³⁶ The negative price suggested that sellers were paying buyers to take delivery to limit the storage cost. Oil demand crashed globally (Box 15.2). The panic in the oil market was exacerbated by the fall in demand when the May futures, which were going to expire later on 21 April 2020. It was at energy pause. But the oil industry limped back. Oil price is expected to climb in the post pandemic world. However, there are doubts expressed by market watchers that demand for oil is already peaked.³⁷

Box 15.2: Can a Virus Kill the Oil Market?

Yes and no. . . probably. For the first time in history of oil business, a futures contract for the US crude prices turned negative on 20/21 April 2020. The demand drop was attributed to the pandemic and the panic caused by a virus—corona. Yes, the oil market got beaten by an invisible virus. But it can't win against the visible human in the long term. That's what humans say. The virus

Gas	21.4	24.2
Others—nuclear, hydel, renewable, etc.	14.6	15.7

Box 15.2 (continued)
hasn’t reacted. The price settled at USD37.63%, negative. That meant producers (sellers) would pay the traders (buyers) USD37.63 to take the oil off their hands. Have you ever been to a superstore where one gets paid for what is bought? Ask a virus.

Oil is transported through tankers and pipelines. Both can envisage problems that are economical and political besides environmental issues. The Persian Gulf, which is vital for oil production, is also a troubled area. Besides external interventions and internal problems, transportation is an issue through the choke point of Strait of Hormuz. Free flow of oil through the Strait can be affected by internecine political problems beside that of navigation through congested traffic. While Iran is most affected since it has no realistic alternatives to the Strait for flow of oil, Iraq stands to advantage as it can route oil through Turkey and Jordan.

As the world energy demand increases with temporary pandemic pause, attention will be drawn towards natural gas among all other sources of energies. The consumption rose from 17.5% in 1970 to 21.4% in 1995. It is projected to be 27.2% in 2020.³⁸ Eighty percent of natural gas consumption occurs in producing countries according to a study.³⁹ This trend may change if the gas can be transported more economically. The world energy consumptions status in 1995 is given in Table 15.3. The table also compares it with the consumption in 2019.⁴⁰ Interestingly, the consumption seems very close in spite of a 15-year difference. The unchanged energy consumption protocol of the world can also carry forward the severity of environmental and economic state of affairs in a world that is advancing fast forward in demographic density.⁴¹ The table can be critically examined for decision-making for a better world sans pollution and conflicts.

The consumption of oil is expected to drop and that of gas to increase in the future. Energy consumption is growing rapidly in developing countries as an indicator of growth. Most of Asia’s demand for energy is coming from China and

³⁸Ibid, p. 43.

⁴¹5.7 billion in 1995 and 7.7 billion in 2019.

India according to studies.⁴² While both these countries have large deposits of coal, their dependence on oil and gas is expected to increase. Increased demands for oil in developing Asia may make them look up largely to Persian Gulf. The trend in energy consumption is to consume less for more value output with technological advancement that allows greater energy efficiency. The historic trend is less energy per unit output in economy. This is also due to the shift towards less energy consumption industry like information technology.

Trend in new energy resource finding is of mixed interest. Among the new resources, fuel cells have a higher potential. But they have to be user friendly. They have the potential. Unlike a battery, the fuel cell uses reactants externally. There are fuel cells for vehicles and industrial and home applications today. They may soon enter the marine world also. That will be huge saving in oil consumption. The fuel cells will be active as long as it is supplied with the reactants—oxygen and hydrogen.⁴³ These forecasts in energy demand are subject to uncertain variables—especially those related to economic growth rates, trends in energy intensity of output, energy and otherwise (wars, social and economic upheavals, etc.).

The world resources of oil are unequally divided among around 182 nations out of which 42 account for about 96% of oil production (Table 15.4).⁴⁴ There are about 70 nations that do not produce oil in the world.⁴⁵

The countries that will control major supplies of oil in the future are expected to be Saudi Arabia and those in the Former Soviet Union. From this calculation, it can be seen that Saudi Arabia is formidable in regard to world oil production and will control 16.3% of the world's future oil supply. The trend, however, shows several years more unfettered oil production, though there are views that it will peak seriously by 2010. A newly enhanced finding of oil may keep the all-time peak delayed up to 2040. Even if the answer is that the delay in oil peak may be probable, the fact remains that it will end one day. The delay, hopefully, should give enough time to the world to identify alternate energy resources and get used to them.

While most of these countries are producing oil, internal situations in many of them are conflict ridden. The problems are *socio-econo-political that may affect the world oil and gas markets. A worthwhile prediction under such situation is highly improbable.*

15.7 Challenges of Energy Security

Energy security is a serious challenge to the world governments. Mostly the decision-making has to be under uncertain variables and conflict scenario. There are various conditional situations:

- (a) The demand for energy and choice for a particular resource
- (b) Cost of research, funding, exploration, production and transportation
- (c) Change over to alternate source of energy
- (d) Availability of energy alternatives and choice of suitable economic output matching the resource
- (e) Achieving energy efficiency to manage energy intensity
- (f) Market force determination of energy availability
- (g) Political factors controlling energy availability
- (h) Upheavals in international and global security
- (i) Upheavals in national security
- (j) Physical security of energy resource locations and transportation lines
- (k) Decision on hedging against energy shocks—strategic energy reserves

The matrix is complex. Under such conditions, capability in decision-making under uncertainty will be very much in demand. The best prospect for market stability of an identified resource will depend upon all these conditions. Conservation of energy will need price adjustments because of speculations in a fluctuating price scenario. The fluctuations can widen the uncertainty of supply markets. Enhancement of regional and global interactive goodwill is necessary under such conditions. Awareness among nations that enormity can choke all of them of quality life is important. The games played by nations to throttle each other will be counterproductive in the face of energy security. It is to be understood that the current feeling is that worldwide energy supplies will remain to be ample, though at a higher price in tandem with inflation unless price wars and market forces do not fluctuate seriously. Even then, security matters may cause alarm and unprecedented actions by overly worried nations who have the capability (the one who got the gun may be tempted to shoot). The scenario may range from absolute optimism to perverse pessimism. The situation in that case should be the median line. That simply means the trend will be as it is today. The superpower, whoever it may be, will decide the security issues that in turn will deal with energy security in the world, of course, with an interest towards its own. Energy security is an element that may highly influence global security matters.

The argument that economic prosperity beckons the rate at which energy produced is valid in the first place. But a serious study will reveal that energy consumption is a linear variable and so is economic prosperity. Ideally, a higher consumption means increased prosperity in a linear model. It may sound fine, but the fact remains that energy is a limited resource. A limited resource can decline suddenly, especially when a nation does not have absolute control over it. It is like driving a car in a long distance without refilling. It may stop at any time in the process. The problems faced

by the people in the car will depend entirely on the point at which it stops. The problem will be more serious if the car stops in the wilderness and much less if it stops a few yards short of destination. Fortunately, in a car, it can be predicted when the fuel would get over, and plan accordingly. In human life, controlled by energy, it is not that easy. Besides, life's destination is eternity, not a fixed distance. One cannot predict where the nation or the world humanity will be when the fuel runs out. Absolute control will not be there even if fuel is available. In the energy metaphor, there is no end destination. In any case, a nation should have the capability to get the energy required in an economical manner. Sometimes import may be more cost effective. There is, therefore, no steadfast rule in energy usage and management. It has to be circumstantial and based on demand and political compulsions. In such cases, certain countries depend on indigenous production, whereas others may like to preserve their resources and buy from outside. The centre of gravity of energy management with respect to energy security under such situation—imports vs. preservation—will lie at the critical points of change over. Such situations may exist more than once. That is not all; the choice for nations may be many. In a typical example, applicable to oil security, the choices available could be as follows:

- (a) Import all requirements.
- (b) Import nil; exploit indigenous stock.
- (c) Import partially; exploit indigenous stock for balance requirement.
- (d) Import, exploit and export indigenous resource stock.
- (e) Import nil; exploit indigenous stock and export.

Under such maxim, the energy security matrix will be as follows:

- (a) Import all, no indigenous stock.
- (b) Import all; reserve indigenous stock.
- (c) Import and exploit reserve (quantum and ration will depend on policy).
- (d) No import; use only indigenous stock.
- (e) Import, exploit and export.
- (f) Import, reserve or refine and export (no exploitation locally).

There are no shortcuts in energy management. It cannot be worked out on a "let us stretch it out as far as possible by any means" principle. It is an issue that is strictly global and not country specific because serious energy imbalance may invite unforeseen problems. The world cannot be divided into extreme civilisations—Olduvai on one side and Manhattan on the other without serious mix-ups.

In the case of oil, the primary fuel of the world today, there are arguments on long-range oil policies. Such policies are not feasible since fluctuations in oil parameters are far too frequent. Therefore, one needs interrupted long-range policies where, at the intermediary stages, one stops and looks around before proceeding further. The question before a nation with large resources of untapped oil and gas is whether to produce or import. Many prefer import. But import keeps them technologically at bay. And the policy of exploitation of own resources only when every

well goes dry in the world may invite unforeseen consequences while digging it. They can be foreseen.

China is the world's largest crude oil importer as of 2020. Its new refinery capacity and strategic inventory stockpiling, combined with flat domestic oil production, were the major factors contributing to the increase in China's crude oil imports in 2019. The crude oil imports in 2019 were to an average of 10.1 million barrels per day (b/d).⁴⁶ China has abundant coal deposits, but coal is less environmentally friendly than oil. Energy security for any nation is very closely related to military security. The nation that imports has to have absolute control of the line of transportation of oil. That means the seaways and the pipelines. China may choose the Myanmar route as its safe bet for pipelines rather than Bangladesh, Pakistan or Thailand. Security of pipelines is vital for uninterrupted supply of oil. China can have a secure pipeline from Myanmar's Bay of Bengal port to Kunming, the capital of Yunnan province, considering the favourable relations both the countries have.⁴⁷ Geostrategically, China shares varied interests with Myanmar. It has already established strategic naval bases, airstrips and electronic intelligence units in Myanmar's Coco Islands in North Andaman. The islands are less than 25 miles across the Indo-Myanmar international boundary line from North Andaman in Bay of Bengal.

Energy is closely linked with geostrategic security. While every nation that needs energy (that means all in the world) attempts its own policies to maximise energy security as considered effective by the government, the common aspects of energy security for the future may underlie in definite activities related to:

- High calibre and urgent research in developing alternate and renewable energy resources in general and particularly in bioenergy and hydrogen fuel
- Policy-based encouragement in the use of renewable and alternate energy resources at a national level
- Legal and fiscal measures to support energy production
- Improved energy infrastructure
- Energy diplomacy especially in the field of oil
- Geostrategic management of energy

Energy security calls for more than one solution. In addition to strategic partnership on common ground, even with enemies on a win-win or win-hold-win approach will resolve most of the short-term issues. Auditing energy for all activities is vital for energy conservation. It has to be a national drive that is implemented seriously. Energy-efficient equipment and policies are matters that shall go along with energy audit. It has to be a people-involved movement. Notwithstanding exploration and production problems, there are threats to oil facilities especially from terrorists and insurgents. All these and rise in oil prices can cause heavy burden on energy security.

⁴⁶“Barron, J. “China's crude oil imports surpassed 10 million barrels per day in 2019.” <https://www.eia.gov/todayinenergy/detail.php?id=43216>. Accessed 27 January 2021.

⁴⁷Ibid.

There are people who think the price will escalate up to USD100 per barrel one day. If the price audaciously rises to USD100 per barrel, then the elasticity may take it even to USD125 in the immediate future thereafter and further. That could be violently sadistic. Upper limit to a panic reaction is anybody's guess. Such situations are relatively short lived and strategic reserves are required to tide over the problem. One way to tame the rising oil prices is the quota system for crude oil. The next in the supply chain is the capacity and security of oil tankers. There is a mismatch in this chain since there are not enough tankers since the production is under, and single hull tankers are on their way out. If the transportation capacity is less, then storage capacity should increase. That again is a matter of economics and security. Charter rates can become unstable causing further problems and price variations. Security of tankers and tanker facilities is another concern. Terrorist attacks on tankers will increase prices further, for crude and for transportation, besides panic insurance.

The attack on the French super tanker Limburg off Yemen in October 2002 proved the apprehensions of terrorist attack on tankers a reality. About 100,000 barrels of oil reportedly spilled and burned.⁴⁸ The attack was attributed to the fundamentalist terrorist group Al Qaeda. There are around 3600 tankers in the world. But the world's oil supply is transported by just 435 of them.⁴⁹ Very large crude carriers (VLCC)⁵⁰ can carry up to two million barrels. The next large size is the ultra large crude carrier (ULCC).⁵¹ They are booked to capacity, and the production is slow.

The demand for energy is rising worldwide. The question for nations will be whether and, if so, how to opt for energy independence. If not, reliance on foreign sources will increase. And in today's world, no country can march in an army without a serious excuse to go and get it. And everyone does not have that kind of an army. A balanced strategy in managing energy security comprises many aspects than using the military to get foreign resource reliance. It is difficult to identify the relative importance of each of the methods. Conservation of energy is one of them. This calls for efficient energy audits and energy savers incorporated within the consumption pattern. Modernising energy delivery system to prevent loss of energy is another method. The loss is very high in most of the electric supply and distribution systems in the world. Electrical energy is a secondary form of energy with another energy resource acting as its prime mover. Loss in electrical energy induces multi-energy cost since it is secondary energy—energy derived from a primary energy source. It is critical when energy balance is weighing against time. Preventing energy loss at every stage in every system takes priority in this sector. While

⁴⁸Timmons, H. "Tankers and Security Needed to Ease Oil Crunch." *The New York Times, Articles Selected for Asian Age*, New Delhi. 22 June 2004, p. 7.

⁴⁹Ibid.

⁵⁰Paleri, P. "A Comparative Study of Shipping as an Industry and India's Position in World Shipping." *MBA Thesis*, University of Madras, March 1977, p. 20. The size of a VLCC is between 200,000 and 400,000 tonnes.

⁵¹Ibid. The size of a ULCC is above 400,000 tonnes.

conserving energy is optimising energy, loss prevention is a waste control. Technology is the key for both. Technology does not stop here because development in technology itself is essential for economic exploitation of energy resources. Technology will lead to new resources of energy like hydrogen. The by-product will be water and not ecologically destructive carbon dioxide. Renewable energy promotion at all levels is a policy decision that could change the way people will see energy consumption tomorrow. These are urgent issues of national security. There are many sectors—agriculture, home, entertainment, cities, etc.—where renewable energy can revolutionise human systems. Properly funded and with government support, such energy communes are only a matter of adaptability.

15.8 Energy Security and Law of Conservation of Energy

If the law of conservation of energy is to be believed, energy is perpetual. And humans being intelligent should be able to source them all the time. “Energy can neither be created nor destroyed” is the catch phrase. It can only be transformed into usable form where it exists, which is everywhere. The human intellect will grow according to human needs and to a good extent modified by human wants. The apparent security and perceived security mix of the survival gorge in the mental plane shape the survival futures.

Ultimately, the answer to energy security may lie in the law of conservation of energy—in physics, not strictly in economics. Energy will always remain around as it is not connected with the human life alone. The sapiens are just visitors to the world of energy. These statements are not important here, but as appendages to break the monotony. Humans can reach out to energy which they will as intellectual growth is linear though rhythmically exponential. It should move forward without interruption. It is a feeling at the moment based on physics and human life that there will always be energy around and humans or any intelligent forms of life will be able to exploit it for their use by extrapolation through technology.

15.9 Is Energy Regeneration from Spent Energy Feasible?

This is not a weary question. This is a probing tool in the kit of a national security practitioner. If the law of conservation of energy is true, zapping energy is possible.

Carbon dioxide could be a potential candidate for regeneration of (zapping) energy. Besides, they need to be taken off from the much-abused green list. CO₂ could be one of the fuels of the future. Technology to recycle CO₂ into hydrogen and oxygen could be similar to recycling other things in methodology and principle. In fact, energy will be refined from CO₂ in the atmosphere. The CO₂ is then combined with hydrogen in water. It will be theoretically identical to any fuel sans pollutants.

Aren't the plants doing it using chlorophyll? And living happily unless humans put an axe at the bottom, without craving for caves a la Olduvai?
